CTH	Aviation Training Cruiser
CTIA	Counter Technical Intelligence Activities
CTIS	Commander's Tactical Information System
CTL	Critical Task List
CTLZ	Control Zone
CTOC	Corps Tactical Operations Center
CTOCSE	CTOC Support Element
CTOL	Conventional Take-Off and Landing
CTP	Consolidated Telecommunications Program
CTR	Center
CTRL	Control
CTS	(1) Course Training Standards; (2) Communications Technology Satellite
CTSCR	Critical Time-Sensitive Collection Requirement
CTT	(1) Commanders' Tactical Terminal; (2) Common Task Test; (3) Combat Control Team
CTTA	Certified TEMPEST Technical Authority
CTT-H	Commanders' Tactical Terminal-Hybrid
CTTP	(1) USCENTCOM Tactics, Techniques, and Procedures Manual; (2) Component Tactics, Techniques, and Procedures Manual
CTU	Commander Task Unit
CU	Channel Unit
CUBB	Collateral Users Bulletin Board
CUBIC	Common User Baseline for the Intelligence Community
CUCV	Commercial Utility Cargo Vehicle

CUDIXS	Common-User Digital Information Exchange System
CUL	Combined User Language
CURR	Current
CUSRPG	Canadian-U.S. Regional Planning Group (NATO)
CUWTF	Combined Unconventional Warfare Task Force
CV	(1) Multipurpose Aircraft Carrier; (2) Carrier Vehicle; (3) Aircraft Carrier
CUP	COMSEC Utility Program
CVA	Clandestine Vulnerability Analysis
CVAN	CINCPAC Voice Alert Network
CVBF	Carrier Battle Force
CVBG	Carrier Battle Group
CVG	Guided-Missile Aircraft Carrier
CVGN	Nuclear-Powered Guided-Missile Aircraft Carrier
CVH	V/STOL Aircraft Carrier
CVHG	Guided-Missile V/STOL Aircraft Carrier
CVHGN	Nuclear-Powered Guided-Missile V/STOL Aircraft Carrier
CVHN	Nuclear-Powered V/STOL Aircraft Carrier
CVIC	Carrier-Based Intelligence Center
CVL	Light Aircraft Carrier
CVLGN	Nuclear-Powered Guided-Missile Light Aircraft Carrier
CVLN	Nuclear-Powered Light Aircraft Carrier
CVN	Nuclear Powered Aircraft Carrier
CVRT	Combat Vehicle (Reconnaissance, Tracked)
CVS	(1) Antisubmarine Aircraft Carrier; (2) Commercial Vendor Services
CVSD	Continuously Variable-Slope Delta Modulation
CVT	Training Aircraft Carrier
CVTS	Compressed Video Transmission Service
CVW	Carrier Air Wing
CW	(1) Chemical Warfare; (2) Carrier Wave; (3) Continuous Wave; (4) CONSTANT WATCH; (5) Composite Wing; (6) Commonwealth
C/W	Crisis/Wartime
CWC	(1) Composite Warfare Commander; (2) Conventional Weapons Guide
CWG	Coordinates Working Group
CWI	Conventional Weapons Index
CWIS	Crisis Window Information System
CWO	(1) Communications Watch Office; (2) Chief Warrant Officer
CWS	(1) Compartmented Work Station; (2) Collateral Workstation (ASAS)
CWT	Chemical Weapons Treaty
C2X	CCTF C2 OBI/CI Support Element
CY	Calendar Year
CYCLOPS	Fleet Support Message
CZ	(1) Combat Zone; (2) Convergent Zone

D

5D	Demand-Driven Direct Digital Dissemination
D	(1) Deciduous; (2) Density
D2	Data Distribution
DA	(1) Department of the Army; (2) Long-Range Aviation (USSR); (3) Double Agent; (4) Direct Action
D/A	Digital/Analog
DAA	Designated Approval Authority
DAB	Defense Acquisition Board
DABM	Defense Against Ballistic Missiles (Now SDI)
DABS	Dynamic Air Blast Simulator
DAC	(1) Development Assistance Committee of OECD; (2) Department of Army Civilian; (3) Discretionary Access Control
DACCO	Department of the Army Central Control Office
DACCS	Digital Access Cross-Connect System/Switch
DACOM	Data Communications
DACOS	Deputy Assistant Chief of Station
DACOS/I	Deputy Assistant Chief of Staff-Intelligence
DACT	Dissimilar Air Combat Tactics
DACU	(1) Device Access Control Unit; (2) Device Attachment Control Unit
DAD	Dual Air Density
DAES	Defense Acquisition Executive Summary
DAF	Department of the Air Force
DAG	(1) Defense Special Security Communications Systems Address Group; (2) Divisional Artillery Group (FSU)
DAIRSDIA	Advanced Imagery Reproduction System
DAISY	Daily Summary
DAJDIA	Office Symbol for JMITC
DALASP	Defense Advanced Language and Area Studies Program
DALATS	Data Logging and Transmission System
DAMA	Demand Assigned Multiple Access
DAMI	Department of the Army Military Intelligence
DAMPL	Department of the Army Master Priority List
DAO	Defense Attache Office
DAP	Designated Acquisition Program
DAPA	Drug and Alcohol Program Advisor
DAR	Designated Area for Recovery
DARC	District Area Command
DARO	Defense Airborne Reconnaissance Office
DARP	Defense Airborne Reconnaissance Program
DARPA	Defense Advanced Research Projects Agency
DARS	(1) Daily Aerial Reconnaissance and Surveillance; (2) Daily Apportionment and Reconnaissance Scheduling; (3) Daily Aerial Reconnaissance Syndicate

DARSC	Defense Airborne Reconnaissance Steering Committee
DARSP	Defense Academic Research Support Program
DART	(1) Developmental Air Reports Tracker; (2) Deployable Automated Remote Terminal
DARTS	Digital Antijam Radio Teletype System
DAS	(1) Defense Attache System; (2) Data Acquisition Segment
DASC	Direct Air Support Center
DASD	(1) Deputy Assistant Secretary of Defense; (2) Direct Access Storage Device
DASD(I&S)	Deputy ASD (Intelligence and Security)
DASH	Deployable Automated Support Host
DASPA	Defense Attache System Property Accounting
DASR	Defense Analysis Special Report
DASVA	Defense Attache System Vehicle Accounting
DAT	Direct Action Team
DATAINT	Data Intelligence
DATEXT	Data Extract
DATPS	Diver Active Thermal Protection System
DATS	Data Automated Tower Simulation
DATT	Defense Attache
DAWN	Defense Attache Worldwide Network
DAWS	Defense Automated Warning System
DAYLT	Daylight
dB	Decibel
DB	Data Base
DBA	Data Base Administrator
DBAS	Data Base Applications System
DBBL	Dismounted Battlespace Battle Lab
DBC	Data Base Correlation
DBCTRL	Data Base Control
DBD	Data Burst Device
dBi	Decibel (referenced to isotropic radiator)
DBIDI	Data Base of Imagery-Derived Information
DBK	Dominant Battlefield Knowledge
dB/K	Decibels per Degrees Kelvin
dBm	Decibels (referred to 1 milliwatt)
DBMAINT	Data Base Administrator
DBMS	Data Base Management System
DBQ	Data Base Query
DBS	(1) Data Broadcast System (also known as SCAMPI); (2) Direct Broadcast Service
dBSM	Decibels Per Square Meter
dBw	Decibels Referenced to One Watt of Power
DC	(1) District Commissioner; (2) Damage Control; (3) Defense Council; (4) Direct Current

DCA	(1) Defense Communications Agency; (2) Defense Cooperation Agreement; (3) Defensive Counter Air
DCAEUR	Defense Communications Agency Europe
DCAOC	DCA Operations Control Center
DCAPSS	Dual Criteria Aimpoint Selection System
DCAS	(1) Deployable Consolidated Applications Server; (2) Deployable Communications Applications Shelter
DCCC	Defense Collection Coordination Center
DCE	(1) Defensive Counter Espionage; (2) Data Communications Equipment
D-Cell	Deployment Cell
DCF	DOCS Certification Facility
DCG	Deputy Commanding General
DCGS	Distributed Common Ground System
DCI	Director of Central Intelligence
DCIA	Director, Central Intelligence Agency
DCIB	Defense Counterintelligence Board
DCID	Director of Central Intelligence Directive
DCII	Defense Central Index of Investigations
DCI&S	Director of Counterintelligence and Security
DCIIS	Defense CI Integrated Information System
DCINC	Deputy Commander in Chief
DCIP	Defense Counterdrug Intelligence Program
DCL	Direct Communications Link
DCM	Deputy Chief of Mission
DCMM	Database Creation and Management Module
DCMS	Database Creation and Management Segment
DCN	Defense Communications Network
DCO	(1) Defense Communications Office; (2) Deputy Commander for Operations (USAFE); (3) Dial Central Office; (4) Deputy Commanding Officer
DCOS	Deputy Chief of Staff
DCOSIPR	Deputy Chief of Staff, Intelligence Plans and Requirements
DCP	(1) Disaster Control Plan; (2) Decision Coordinating Paper; (3) Defense Cryptologic Program
DCR	Data Change Request
DCRSI	Digital Cassette Recording System (Improved)
DCS	(1) Defense Communications System; (2) Deputy Chief of Staff; (3) Defense Courier Service
DCS/I	Deputy Chief of Staff Intelligence
DCS/IN	Deputy Chief of Staff for Intelligence
DCSCA	Defense Communications System Central Area
DCSEC	Deputy Chief of Staff, Security
DCSI	Deputy Chief of Staff, Intelligence
DCSIM	Deputy Chief of Staff, Information Management
DCSI/DCSINT	Deputy Chief of Staff Intelligence (USAREUR)
DCSINT	Deputy Chief of Staff for Intelligence (U.S. Army)

DCSLOG	Deputy Chief of Staff for Logistics
DCSO	Deputy Commander for Space Operations
DCSOPS	Deputy Chief of Staff for Operations & Plans
DCSP	Design Controlled Spare Part(s)
DCSPER	Deputy Chief of Staff for Personnel
DCS/SSI	Deputy Chief of Staff for Safety, Security, and Intelligence
DCSTOP	Damage Criteria Study Target Data Base
DCTN	Defense Commercial Telecommunications/Teleconferencing Network
DD	(1) Destroyer; (2) Deputy Director; (3) Department of Defense; (4) Differential Doppler
D&D	Denial and Deception
DDAC	Foreign Denial and Deception Analysis Committee
D/DARO	Director, DARO
D-Day	Day in which a particular operation begins
DDC	(1) Defense Documentation Center; (2) Data Distribution Center
DDCI	Deputy Director of Central Intelligence
DDCMP	Digital Data Communications Message Protocol
DDDDD	Demand-Driven Direct Digital Dissemination System
DDG	Guided Missile Destroyer
DDGN	Nuclear-Powered Guided-Missile Destroyer
DDH	Aviation Destroyer (ASW)
DDHG	Guided-Missile Aviation Destroyer
DDHGN	Nuclear-Powered Guided-Missile Aviation Destroyer
DDHN	Nuclear-Powered Aviation Destroyer
DDI	Deputy Director of Intelligence
DDL	Direct Data Link
DDN	(1) Defense Data Network; (2) Defense Dissemination Network
DDO	(1) Deputy Director of Operations; (2) Deputy Duty Officer
DDP	Defense Dissemination Program
DDPO	Defense Dissemination Program Office
DDR&E	Director, Defense Research and Engineering
DDRS	Defense Data Repository System
DDS	(1) Defense Dissemination System; (2) Dry Deck Shelter; (3) Dual Driver Service (courier)
DDS/RL	Defense Dissemination System/Receive Location
DDSP	Defense Development Sharing Project
DDSS	Document Dissemination and Storage Segment
DDT	(1) Training Destroyer; (2) Distributed Decision-Aid Terminal
DDU	Distant Device Unit
DE	(1) Damage Expectancy; (2) Directed Energy; (3) Directorate for Estimates (DIA)
DE-U	Dissemination Element-Upgrade
DE/EW	Directed Energy/Electronic Warfare
DEA	Drug Enforcement Administration
DEACON	Defense Estimates Analytical Computer On-Line Network

DEB	(1) Digital European Backbone; (2) Defense Estimative Brief; (3) Debris (Orbital)
DEC	Digital Equipment Corporation
DEC (VAX)	Digital Equipment Corporation (Virtual Address Extension)
DECCO	Defense Commercial Contracting Office (now DITCO)
DECM	(1) Defense Electronic Countermeasures; (2) Deceptive Electronic Countermeasures
DECON	Decontaminate(ion)
DEDAC	Deception and Denial Analysis Committee
DEDDF	Digital Elevation Data Dubbing Facility
DEF	Defense
DEFCON	(1) Defense Condition; (2) Defense Readiness Condition
DEFCOS	Defense Courier System
DEFPLAN	Defense Plan
DEFSMAC	Defense Special Missile and Astronautics Center
Deg	Degree
DEGRAD	Degradation
DELORME	a Digital Mapping Computer Program
DEMEX	Demonstration Exercise
DEMOD	Demodulator
DEMONS	Demonstration System
DEMPC	Data Exploitation, Mission Planning, Communications/Center
DENAS	Daily European Naval Activity Summary
DEP	(1) Deflection Error Probable; (2) Defense Estimate for Production; (3) Deployed
DEPCOMNAVCENT	Deputy COMNAVCENT
DEPCOMUSNAVCENT	Deputy Commander, U.S. Naval Forces Central Command
DEPREP	Deployment Report
DEPSECDEF	Deputy Secretary of Defense
DEPT	Department
DES	(1) Digital Exploitation System; (2) Data Encryption Standard
DESA	Defense Evaluation Support Activity
DESC	Defense Electronics Supply Center
DESIGN	Designator (U.S. Navy)
DESIST	Decision Support and Information System for Terrorism
DESS	Defense Exploitation Support System
DESRON	Destroyer Squadron
DET/Det	Detachment
DEW	(1) Distant Early Warning; (2) Directed Energy Weapon
DEWLINE	Distant Early Warning Line
DF	(1) Direction Finding; (2) Disposition Form; (3) Deuterium Floride
DFAD	Digitized Feature Analysis Data
DFDS	Data Facility Dataset Services
DFED	Digitized Features Data
DFH	Deployed Forward Headquarters

DFLP	(1) Defense Foreign Language Program; (2) Democratic Front for the Liberation of Palestine
DFM	Deterrent Force Modules
DFOV	Dual Field of View
DFRIF	Defense Freight Railway Interchange Fleet
DFS	Direction Finding Subsystem
DFT	(1) Deployed for Training Team; (2) Deployment for Training
DG	Defense Guidance
DGCL	Ground Mobile Forces Control Link
DGCS	Downsized Ground Control Station
DGCT	Downsized Ground Control Terminal
DGIAP	Defense General Intelligence Applications Program
DGIF	Deployable Ground Intercept Facility
DGIS	Director General Intelligence and Security
DGITS	Digital Graphics Information Tailoring System
DGS	Deployable Ground Station
DGU	Downgrade to Unclassified
DGZ	(1) Desired Ground Zero; (2) Designated Ground Zero
DH-7	deHavilland Dash 7 (Drug Interdiction Aircraft)
DHCA	Data Handling Capability Analysis
DHFN	Direct Hire Foreign National
DHS	Defense HUMINT Service
DI	(1) Director of Intelligence (USEUCOM); (2) Directorate for Foreign Intelligence (DIA)
DIA	(1) Defense Intelligence Agency; (2) Defense Intelligence Assessment
DIA/CS	Defense Intelligence Agency/Command Support
DIAAPR	Defense Intelligence Agency Appraisal
DIAC	Defense Intelligence Analysis Center
DIAI	DIA Instruction
DIAIAPPR	DIA Intelligence Appraisal
DIAL	Defense Intelligence Agency Liaison
DIAL-J	DIA Liaison Office for Japan
DIALO	DIA Liaison Office
DIALOG	DIA Information Retrieval System
DIAM	Defense Intelligence Agency Manual
DIAMCP	DIA Master Contingency Plan
DIANM	DIA Analytical Memorandum
DIAOB	Defense Intelligence Air Order of Battle
DIAOLS	DIA On-Line System
DIAPF	DIA Part File
DIAR	DIA Regulation
DIATP	DIA Tactical Program
DIATS	DIA Terrorism Summary
DIB	(1) Defense Intelligence Board; (2) Defense Intelligence Brief; (3) Directory Information Base

DIC	(1) Defense Intelligence Community; (2) Difference in Condition; (3) Defense Intelligence College (Now JMIC); (4) Defense Intelligence Commentary
DICBM	Depressed Intercontinental Ballistic Missile
DICP	Defense Intelligence Counterdrug Program
DID	(1) Data Line Description; (2) Defense Intelligence Digest (Now Military Intelligence Digest); (3) Data Item Description
DIDHS	Deployable Intelligence Data Handling System
DIDOP	Digital Image Data Output Product
DIDS	Defense Intelligence Dissemination System
DIDSRS	Defense Intelligence Dissemination, Storage and Retrieval System
DIE	Defense Intelligence Estimate
DIEB	Defense Intelligence Executive Board
DIEC	Deployable Imagery Exploitation Capability
DIEPS	Digital Imagery Exploitation and Production System
DIEM	Defense Intelligence Estimates Memorandum
DIEOB	Defense Intelligence Electronic Order of Battle
DIFAR	(1) Directional Frequency Analysis and Recording System; (2) Directional Frequency and Ranging
DIFAX	(1) Defense Intelligence Facsimile; (2) Defense Intelligence Security Facsimile Network
DIFM	Defense Intelligence Functional Manager
DIFR	Defense Intelligence Facility Report
DIGITS	Digital Geographic Information Tailoring System
DIGOB	Defense Intelligence Ground Order of Battle
DIH	Daily Intelligence Highlights
DIHEST	Direct Induced High-Explosives Simulation Technique
DII	Defense Information Infrastructure
DIIN	Defense Imagery Intelligence Notice
DIIP	Defense Intelligence Interoperability Panel
DIIPS	Digital Imagery Interactive Processing System
DIIS	DIA Integrated Intelligence System
DILC	Dedicated Intelligence Loop Circuit
DIM	Defense Intelligence Memorandum
DIMES	Digital Image Manipulation & Enhancement System
DIMMD	Diver Integral Magnetic Mine Detector
DIMOB	Defense Intelligence Missile Order of Battle
DIMSS	DSN Integrated Management Support System
DIN	(1) Defense Intelligence Notice; (2) Defense Intelligence Network; (3) AUTODIN
DINAH	Desktop Interface to AUTODIN Host
DINOB	Defense Intelligence Naval Order of Battle
DINSUM	Defense Intelligence Summary

DIO	(1) Defense Intelligence Officer (DIA); (2) District Intelligence Officer (U.S. Navy); (3) Defence Intelligence Organisation (Australian)
DIOB	Defense Intelligence Order of Battle
DIOBS	Defense Intelligence Order of Battle System
DIOP	Defense Intelligence Objectives and Priorities
DIP	(1) Defense Intelligence Plan; (2) Defense Imagery Program
DIPC	Defense Intelligence Production Council/Conference
DIPFAC	(1) U.S. Diplomatic Facilities Graphic; (2) Diplomatic Facility
DIPOLES	Defense Intelligence Photoreconnaissance On-Line Exploitation System
DIPP	Defense Intelligence Projection for Planning
DIPS	(1) Defense Intelligence Production Schedule; (2) Digital Imagery Processing System; (3) Def Intelligence Production Study
DIR	(1) Defense Intelligence Report; (2) Directive; (3) Defense Imagery Report; (4) Director; (5) Direction
DIRCM	Direct Infrared Countermeasures
DIRES	Defense Imagery Requirements and Exploitation System
DIRINT	Director of Intelligence
DIRLAUTH	Direct Liaison Authorized
DIRNSA	Director, National Security Agency
DIRNSA/CHCSS	Director, National Security Agency/Chief, Central Security Service
DIROI	Directorate Operating Instruction
DIRS	(1) Defense Intelligence Reference Series; (2) Defense Imagery Reference Series
DIS	(1) Defence Intelligence Staff (U.K.); (2) Defense Investigative Service; (3) Defense Intelligence Summary; (4) Daily Intelligence Summary; (5) Distributive Interactive Simulation; (6) Data Integration System; (7) Defense Information System
DISA	Defense Information Systems Agency
DISA-EUR	Defense Information Systems Agency-Europe
DISA-PAC	DISA-Pacific
DISA WESTHEM	DISA Western Hemisphere
DISAM	Defense Institute of Security Assistance Management
DISC	Daily Intelligence Summary Cable
DISC4	Director of Information Systems Command, Control, Communications and Computers
DISCAS	Defense Intelligence Special Career Automated System
DISE	Deployable Intelligence Support Element
DISECS	Defense Intelligence Space Exploitation and Correlation System
DISES	Defense Intelligence Senior Executive Service
DISIDS	Display and Information Distribution System/Subsystem
DISMOB	Defense Intelligence Strategic Missile Order of Battle
DISN	Defense Information Systems Network
DISNET	Defense Integrated Secure Network
DISO	Defense Intelligence Support Office

DISOB	Defense Intelligence Space Order of Battle
DISP	Defense Industrial Security Program
DISPEWT	Defense Intelligence Space Electronic Warfare Threat Data Base
DISR	(1) Daily Indicator Status Report; (2) Defense Indications Status Report
DISS	(1) Digest of Intelligence and Security Services; (2) Dissemination
DISSEM	Dissemination
DISSO	Deputy Information Systems Security Officer
DIST	Digital Imagery Support Terminal
DISTAFF	Directing Staff (NATO Commands, JECG)
DISTS	Defense Intelligence Secure Telephone System
DISTP	Defense Intelligence Special Technologies Program
DISUM	(1) Daily Intelligence Summary; (2) Defense Intelligence Summary
DIT	Defense Intelligence Thesaurus
DITB	Digital Imagery Test Bed
DITCO	Defense Information Technology Contracting Office (formerly DECCO)
DITDS	Defense Intelligence Threat Data System
DITEQ	Defense Intelligence Thesaurus Equivalency List
DITFOR	Defense Intelligence Technical Forum
DITS	Digital Imagery Transmission System
DITSUM	Defense Intelligence Terrorism Summary
DIV	(1) Division; (2) Defense Intelligence Videocassette
DIVARTY	Division Artillery
DIVISION	Enciphered Television
DIW	Dead in Water
DIWO	Duty Intelligence Watch Officer
DIWS	(1) Digital Imagery Workstation Suite; (2) Defense Indications and Warning System; (3) DOD Intelligence Warning System
DJ2	Deputy Director of Intelligence
DJS	Director, Joint Staff
DJSM	DJS Memorandum
DJTF	Deployable Joint Task Force
DJTFAC	DJTF Augmentation Cell
DLA	Defense Logistics Agency
DLAB	Defense Language Aptitude Battery
DLEA	Drug Law Enforcement Agency
DLED	Dedicated Loop Encryption Device
DLI	Defense Language Institute
DLIFLC	Defense Language Institute, Foreign Language Center
DLO	Defense Liaison Office
DLPT	Defense Language Proficiency Test
DLTV	Daylight Television
D&M	Detection and Monitoring

DM	(1) Dissemination Manager; (2) Decompression Monitor
DMA	(1) Defense Mapping Agency; (2) Direct Memory Access
DMAAC	Defense Mapping Agency Aerospace Center
DMACSC	Defense Mapping Agency Combat Support Center
DMAHTC	DMA Hydrographic and Topographic Center
DMAI	Defense Mapping Agency Instruction
DMAL	Defense Mapping Agency Liaison
DMAR	Deferred Maintenance and Repair
DMB	DODIIS Management Board
DMC&GP	Defense MC&G Program
DMD	Digital Message Device
DMDG	Digital Message Device Group
DME	Distance Measuring Equipment
DMED	Digital Message Entry Device
DMFE	DAWS Message Front End
DMI	Directorate of Military Intelligence
DMOB	Defensive Missile Order of Battle
DMOS	Daily Maritime OPINTEL Summary
DMPC	Deployment Media Production Center Project
DMPI	Desired Mean Point of Impact
DMS	(1) Data Management System; (2) Defense Message System
DMSP	Defense Meteorological Satellite (or Support) Program
DMZ	Demilitarized Zone
DN	(1) Data Net; (2) Duplicate Negative; (3) Department of the Navy
DNA	(1) Defense Nuclear Agency; (2) Deoxyribonucleic Acid
DNAS	(1) DODIIS Network Access System; (2) Data Network Access System
DNC	(1) Director, Naval Communications; (2) Digital Nautical Chart
DNCC	Data Network Control Center
DND	Department of National Defence (Canada)
DNI	Director of Naval Intelligence
DNSIX	DODIIS Network Security for Information Exchange
DNVT	Digital Non-Secure Voice Terminal
DO	Director of Operations
DOA	(1) Department of the Army; (2) Date of Arrival; (3) Director of Administration; (4) Dead on Arrival
DOAT	JAC Counterterrorism/Counterintelligence Analysis Branch
DOB	(1) Depth of Burst; (2) Date of Birth; (3) Defense Order of Battle
DOC	Department of Commerce
DOCC	(1) Defense Communications Agency Operations Center Complex; (2) Deep Operations Coordination Cell; (3) DISA Operational Control Complex
DOCEX	(1) Document Exploitation; (2) Document Exploitation Center
DOCKLAMP	Defense Attache System Message Channel
DOCS	DSCS Operations Control System

DoD, DOD	(1) Department of Defense; (2) Date of Death; (3) Date of Departure
DODCI	DoD Computer Institute
DODCSC	Department of Defense Computer Security Center
DODD	DoD Directive
DODEX	DoDIIS Extended
DODFCIP	DoD Foreign Counterintelligence Program
DODFDCO	Department of Defense Foreign Disclosure Coordinating Office
DODFIP	DoD Futures Intelligence Program
DODIIS	DoD Intelligence Information System
DODIIS SCINET	DoDIIS Sensitive Compartmented Information Network
DODIMS	DoD Intelligence Management System
DODIPP	DoD Intelligence Production Program
DODNACC	Department of Defense National Agency Check Center
DODSATCOM	DoD Satellite Communications Program
DOD SAT COM	DOD Satellite Communications
DODSI	Department of Defense Security Institute
DODSPECREP	DoD Special Representative
DOD TCSEC	DOD Trusted Computer System Evaluation Criteria
DOE	Department of Energy
DOF	Disposition of Forces
DOI	(1) Date of Information; (2) Duration of Illumination; (3) Director of Intelligence; (4) Imagery Division (JAC); (5) Director of Operations and Intelligence; (6) DSSCS Operating Instruction; (7) Date of Intercept
DOJ	Department of Justice
DOMS	Directorate of Military Support
DOMSAT	Domestic Satellite
DON	Department of the Navy
DOO	Daily Operations Order (NATO)
DOPS	DIA Outline Plotting System
DOS	(1) Department of State; (2) Date of Separation; (3) Disk Operating System; (4) Direct Operating System
DOSCOM	Division Support Command
DoSIP	Department of State Intelligence Program
DOSTN	Department of State Telecommunications Network
DOT	Department of Transportation
DP	(1) Duplicate Positive; (2) Development Program; (3) Displaced Person; (4) Delegated Production; (5) Directorate of Production; (6) Data Processing; (7) Decision Point; (8) Director of Personnel
DPAC	Defense Program Analysis Center
DPAE	Director, Program Analysis and Evaluation
DPAS	(1) Digital Patch and Access System; (2) Defense Priorities and Allocations System
DPC	Defense Planning Committee (NATO)
DPF	Digital Processing Facility

DPG	Defense Planning Guidance
DPI	Desired Point of Impact
DPIC	(1) Decentralized Pacific Imagery Processing and Interpretation Center; (2) Defense Photographic Interpretation Center
DPICM	Dual-Purpose Improved Conventional Munitions
DPKO	Department of Peacekeeping Operations
DPL	Degausser Products List
DPM	Dissemination Program Manager
DPOB	Date, Place of Birth
DPOM	Directorate of Plans, Operations, and Mobilization
DPOMIS	Directorate of Plans, Operations, Mobilization, Intelligence, and Security
DPP	(1) Delegated Production Program; (2) Deliberate Planning Process; (3) Distributed Production Program
DPPC	Deployable Print Production Center
DPPDB	Digital Point Positioning Database
DPPG	Defense Policy and Planning Guidance
DPQ	Defense Planning Questionnaire (NATO)
DPRB	Defense Planning and Resources Board
DPRK	Democratic People's Republic of Korea
DPS	(1) Delegated Production System; (2) Data Processing Set; (3) Department of Public Safety
DPSK	Digital Pulse Shift Key
DR	(1) Director; (2) Dissemination Requirement; (3) Directorate of Resources; (4) Detection Radar
DRA	Defense Research Assessment
DRAM	Dynamic Random Access Memory
DRASH	Deployable Rapid Assembly Shelters
DRB	Defense Resources Board
DRC	(1) Defense Review Committee (NATO); (2) Defense Research Comment; (3) Data Reduction Center
DR&E	Defense Research and Engineering
DRIC	Defense Resource Identification Code
DRM	Defense Research Memorandum
DRO	Departmental Requirements Officer
DRP	Disaster Relief Program
DRS	(1) Data Relay Satellite; (2) DoD Imagery Requirements Structure; (3) Data Retrieval Subsystem; (4) Data Reconstruction System
DRSA	Defense Reconnaissance Support Activities
DRSEM	Deployable Receive Segment Engineering Model
DRSN	Defense Red Switch Network

DRSP	(1) Defense Reconnaissance Support Program; (2) Defense Red Switched Program
DRU	Direct Reporting Unit
DRZ	Deep Reconnaissance Zone
DS	(1) Defense Suppression; (2) Direct Support
DS&T	Director of Science and Technology
DSA	(1) Defense Supply Agency; (2) Direct Service Activities (SIGINT); (3) Directed Search Area; (4) Division Support Area; (5) Defense Security Agency (ROK); (6) Digital Signature Algorithm
D&SA	Depth & Simultaneous Attack
DSAA	Defense Security Assistance Agency
D&SABL	Depth & Simultaneous Attack Battle Lab
DSARC	Defense Systems Acquisition Review Council
DSAT	(1) Developmental Submarine Analysis Terminal; (2) Defense Satellite
DSB	Defense Science Board
DSC	Defense Satellite Communications
DSCIS	Daily Space Command Intelligence Summary
DSCS	Defense Satellite Communications System
DSC-SLEP	Defense Satellite Communications System Service Life Enhancement Program
DSCSOC	Defense Satellite Communications System Operations Center
DSDIO	Director, Strategic Defense Initiative
DSE	(1) Direct Support Element; (2) Division Support Element
DSEC	Directorate of Security
DSFOB	Daily Strategic Forces Order of Battle
DSG	Defense Steering Group
DSI	Defense Simulation Internet
DSIATP	Defense Sensor Imagery Application Training Programs
DSIIB	Direct Support Imagery Interpretation Brief
DSIMS	Deployable SouthCom Intelligence Management System
DSI/TCCS	Defense Simulation Internet/Theater Command and Control System
DSM	Data Systems Modernization
DSN	(1) Defense Switched Network; (2) Deep Space Network
DSNET	Defense Integrated Secure Network
DSNET 1	Defense Integrated Secure Network 1 (SECRET level)
DSNET 2	Defense Integrated Secure Network 2 (TOP SECRET level)
DSNET 3	Defense Integrated Secure Network 3 (TS/SCI level)
DSO	Direct Support Operator/Operations
DSP	Defense Support Program
DSPO	Defense Special Projects Office
DSR	(1) Defense Source Register; (2) Data Service Request
DSRA	DODSPECREP-Alameda
DSRP	Defense Space Reconnaissance Program
DSRV	Deep Submergence Rescue Vehicle

DSS	(1) Decision Support System; (2) Devices, Simulators and Simulations
DSSCC	Defense Special Security Communications Center
DSSCS	Defense Special Secure Communications System
DSSCS/DIN	Defense Special Security Communications System/Digital Intelligence Network
DSSR	Deep Space Surveillance Radar
DSSS	Defense Special Security System
DST	(1) Daylight Savings Time; (2) Decision Support Template; (3) Decision Support Tools; (4) Direct Support Team; (5) Digital Support Team
DSTE	Digital Subscriber Terminal Equipment
DSTF	Decision Support Task Force
DSTP	Director, Strategic Target Planning
DSTS	Deep Space Tracking System
DSU	(1) Direct Support Unit; (2) Disk Storage Unit; (3) Data Service Unit (DCTN)
DSV	Deep Submergence Vehicle
DSVT	(1) Digital Subscriber Voice Terminal; (2) Digital Secure Voice Terminal
DT	(1) Developmental Test; (2) Directorate for Science and Technology
DTA	Directorate of Threat Analysis
DTC	(1) Digital Tape Cassette; (2) Desktop Computer
DTC-2	Desktop Computer-2 (Navy)
DTD	Digital Terrain Data
DT&E	Developmental Test and Evaluation
DTE	Data Terminal Equipment
DTED	Digital Terrain Elevation Data
DTG	Date-Time Group
DTI	Doppler-Time-Intensity
DTIC	Defense Technical Information Center
DTIO	Deputy Target Intelligence Officer
DTIR	Defense Technical Intelligence Report
DTLOMS	Doctrine, Training, Leadership, Organization, Material, Soldiers
DTLS	Descriptive Top-Level Specification
DTM	(1) Data Transfer Module; (2) Digital Transfer Module; (3) Digital Target Materials
DTMF	Dual-Tone Multi-Frequency
DTNSRDC	David W. Taylor Naval Ship Research & Development Center
DTOC	Division Tactical Operations Center
DTOCSE	Division Tactical Operations Center Support Element
DTOLM	Doctrine, Training, Organization, Leader Development and Material
DTD	Data Transfer Device
DTP	Drug Testing Program

DTS	(1) Diplomatic Telecommunications System/Service; (2) Data Transmission System; (3) Direct Transmission System; (4) Dedicated Transmission Service
DTSA	Defense Technology Security Administration
DTSG	Digital Technology Subworking Group
DTSS	Digital Topographic Support System
DTU	Data Transfer Unit
DTUC	Data Transfer Unit Cartridge
DUCA	Distributed Users Coverage Antennas
DUG	Deep Underground
DUPLEX	Simultaneous Transmit and Receive
DVO	Direct View Optics
DVM	Digital Voice Module
DVTC	Digital Voice Transmit Communications
D/TWP	Director, Tactical Warfare Programs
DTWS	Digital Topographic Work Station
DU	(1) Decision Unit; (2) Depleted Uranium
DUA	Directory User Agent
DUSD(AT)	Deputy Under Secretary of Defense (Advanced Technology)
DUSD(P)	Deputy Under Secretary of Defense (Policy)
DV	Distinguished Visitor
DVI	Digital Video Interactive
DVITS	Digital Video Imagery Transmission System
DVO	Defense Visit Offices
DWIO	Duty Watch Intelligence Officer (Canadian)
DWIP	Defense-Wide Intelligence Plan
DWS	Disaster Warning System
DWT	(1) Deadweight Ton; (2) Division Wing Team
DZ/LZ	Drop Zone/Landing Zone
DZ/LZ/RZ	Drop/Landing/Recovery Zone
DZS	Drop Zone Study

E

e	Elipticity
E	Evaporites (soil type)
EA	(1) Emergency Action(s); (2) Electronic Attack; (3) Executive Agent
E&A	(1) Exploitation and Analysis; (2) Engineering and Administration
E3	(1) End-to-End Encryption; (2) Emergency and Extraordinary Expenses
EAC	(1) Emergency Action Console; (2) Echelons Above Corps
EACTPC	Echelon-Above-Corps Theater Production Center
EACIC	Echelon-Above-Corps Intelligence Center
EAD	(1) Echelon Above Division; (2) Earliest Arrival Date; (3) Extended Air Defense
EADSIM	Extended Air Defense Simulation
EAM	(1) Emergency Action Message; (2) Event Analysis Matrix
EAMA	African States Associated with the EEC
EAMAS	Emergency Action Message Authentication System
EAP	(1) Emergency Action Procedure; (2) Emergency Action Plan
EAS	Emergency Action System
EASTLANT	Eastern Atlantic Command (NATO)
EASTPAC	Eastern Pacific
EATTG	Enhanced Automated Tactical Target Graphics
EBS	Emergency Broadcast System
EC	(1) European Community; (2) Expenditure Center; (3) Electronic Combat
ECA	(1) Enemy Capability Assessment; (2) Earth Central Angle; (3) Enemy Courses of Action
ECAC	Electromagnetic Compatibility Analysis Center
ECB	Echelons Corps and Below
ECC	(1) Eurasian Communist Countries; (2) European Communist Countries; (3) European Community Commission
ECCM	Electronic Counter-Countermeasures
ECDB	EISS Consolidated Database
ECG	Emergency Coordination Group
ECI	External Communications Interface
ECM	(1) Electronic Countermeasures; (2) European Common Market
ECMA	European Computer Manufacturer's Association
ECMC	Enhanced Crisis Management Capability
ECMO	European Collection Management Office
ECO	Electronic Collection Outstations
ECOA	Enemy Courses of Action
ECOWAS	Economic Community of West African States
ECP	(1) Emergency Communications Plan; (2) Entry Control Point
ECPL	Endorsed Data Encryption Standard Products List

ECS	(1) Electronic Combat Support; (2) European Communications Satellite
ECSC	European Coal and Steel Community
ECSM	(1) Special Assistant for Security Matters; (2) Enhanced Capability Stand-Off Munition
ECSO	European Command Special Operations
ECU	Environmental Control Unit (GSM)
ED	(1) European Capability Datum; (2) EUCOM Directive
EDA	Emergency Dissemination Authority(ies)
E-DAY	Start Day of an Exercise
EDI	European Defense Initiative
EDL	Electric Discharge Laser
EDM	Engineering Development Model
EDMS	Electronic Dissemination Management System
EDN	Emergency Data Network
EDP	(1) Electronic Data Processing; (2) ELINT Data Processor
EDPSELINT	Data Processing System
E-DRB	Expanded Defense (Planning &) Resources Board
EDRE	Emergency Deployment Readiness Exercises
E&E	Escape and Evasion
EEA	Essential Elements of Analysis
EEC	(1) European Economic Community; (2) East European Countries; (3) Enhanced Explosives Charge
EECT	End of Evening Civil Twilight
EEFI	Essential Elements of Friendly Information
EEI	Essential Elements of Information
EELS	Early Entry Lethality and Survivability
EELV	Evolved Expendable Launch Vehicle
EENT	End Evening Nautical Twilight
EEO	Equal Employment Opportunity
EEOB	Enemy Electronic Order of Battle
EEOC	Equal Employment Opportunity Commission
EES	Emergency Evacuation Study
EFCS	Electronic Filmless Camera System
EFD	Electronic Fill Device
EFS	(1) Electronic Filing System; (2) Proper Name of System
EFTA	European Free Trade Association
EFTO	Encrypted for Transmission Only
EFVS	Electronic Fighting Vehicle System
EGA	Enhanced Graphics Adapter
EGADS	Electronic Generation, Accounting, and Distribution System
EGIS	East German Intelligence Service
EHF	Extremely High Frequency
EI	Effectiveness Index
EIA	Electronics Industry Association

EIB	(1) European Investment Bank; (2) External Intelligence Bureau
EIC	Economic Intelligence Committee
EIDB	EISS Integrated Database
EIDS	Electronic Information Delivery System
EIF	(1) ECMC Interface Facility; (2) Enhanced Interface Facility
EIG	Explosive Incendiary Grenade
EIP	ELINT Improvement Program
EIRP	Effective Isotropic Radiated Power
EIS	Enhanced Imagery System
EISI	(1) Electrical Interface-SWPS/IDHS 2000; (2) Electrical IDHS-90/SWPS Interface
EISS	EUCOM Intelligence Support System
EITO	EUCOM Intelligence Training Office EKIP Enhanced Korean Information Package
EKMS	Electronic Key Management System
ELDO	(1) European Space Vehicle Launcher Development Organization; (2) European Launcher Development Organization
ELECTRO-OPINT	Electro-Optical Intelligence Element
ELECTRO-OPTINT	Electro-Optical Intelligence
ELEV	Elevation
ELF	Extremely Low Frequency
ELI	Emitter Location & Identification
Elm	Element
ELMT	Element
ELINT	Electronic Intelligence
ELISA	Electronic Intelligence Search & Analysis
ELNET	European Liaison Network
ELNOT	ELINT Notation
ELOS	Extended Line of Sight
ELS	Emitter Location System
ELSEC	Electronic Security
ELSET	(1) Element Set; (2) Proper Name of System
ELT	(1) Emergency Locator Transmitter; (2) Electronic Light Table
ELT 3000	Electronic Light Table for UNIX-based system
ELV	Expendable Launch Vehicle
EM	(1) Electromagnetic; (2) Enlisted Member; (3) Environmental Monitoring
E-Mail	Electronic Mail
EMA	European Monetary Agreement
EMAP	Electromagnetic Analysis Program
EMATS	Emergency Message Automatic Transmission System
EMC	Electromagnetic Compatibility
EMCS	ELINT Mission Control System
EMCON	Emission Control
EMCP	Electromagnetic Compatibility Program

EMD	Engineering and Manufacturing Development
E&MD	Engineering and Manufacturing Development
EMGTN	Equivalent Megatonnage
EMHS	EUCOM Message Handling System
EMI	Electromagnetic Interference
EMIDS	Experiment for Management Information Data Systems
EMINT	Emissions Intelligence
E-MIPE	Enhanced MIPE
EMIS	Early Mission Identification System
EMIT	Emergency Message Initiation Terminal
EMP	Electromagnetic Pulse
EMR	Electromagnetic Reconnaissance
EMSEC	Emanations/Emissions Security
EMT	(1) Emergency Management Team; (2) Equivalent Megatonnage
EMTR	Eastern Missile Test Range
EMUT	Enhanced Manpack UHF Terminal
En	Enemy
ENDEX	End Date of an Exercise
E-NET	Ethernet
Engr	Engineer
ENL	Enlisted
ENMCC	Expanded National Military Command Center
ENSCD	Enemy Situation and Correlation Division
ENSCE	Enemy Situation Correlation Element
ENSIT	Enemy Situation
ENTNAC	Entrance National Agency Check
EO	(1) Electro-Optical; (2) Executive Order; (3) Escape Orbit; (4) End Office
EOA	Early Operational Assessment
EOB	(1) Electronic Order of Battle; (2) Executive Office Building; (3) Enemy Order of Battle
EOBS	Electronic Order of Battle Server
EOC	Emergency Operations Center
EOD	(1) Explosive Ordnance Disposal; (2) Erasable Optical Disks
EOINT	Electro-Optical Intelligence
EOP	Emergency Operating Procedures
E-OPTINT	Electro-Optical Intelligence
EORSAT	ELINT Ocean Reconnaissance Satellite
EOS	Earth Observation Satellite
EOSAT	Earth Observation Satellite
EOSS	Electro-Optic Sensor System
EOTDA	Electro-Optical Tactical Decision Aids
EOW	Electro-Optic Warfare
EP	(1) ELINT Processor; (2) Electronic Protection
EP-3	U.S. Navy Reconnaissance Aircraft

EPA	(1) Environmental Protection Agency; (2) Evasion Plan of Action
EPAC	Eastern Pacific
EPAMS	Exercise Planning and Message System
EPAT	Earliest Possible Arrival Time
EPDS	(1) Electronic Processing and Dissemination System; (2) ELINT Processing and Dissemination System
EPF	Exploitation Products File
EPIC	El Paso Intelligence Center
EPIRB	Emergency Position-Indicating Radio Beacon
EPL	(1) ELINT Parameters List; (2) Evaluated Products List
EPLRS	Enhanced Position Location and Reporting System
EPMO	European Production Management Office
EPR	(1) Extended Planning Annex; (2) Enlisted Performance Report
EPROM	Erasable Programmable Read-Only Memory
EPS	(1) ELINT Processing System; (2) Electronic Publication System; (3) Exploitation Problem Set; (4) Encapsulated Postscript
EPW	(1) Earth Penetrator Weapon; (2) Enemy Prisoner of War
EPWG	Exploitation Plans Working Group
EPUU	Enhanced PLRS User Units
EQV	Equivalent
ER	(1) Enhanced Radiation; (2) Electronic Reconnaissance; (3) Eastern Region; (4) EAGLE REACH
ERA	(1) Extended Range Ammunition; (2) Equal Rights Amendment
ERADCOM	Electronic Research and Development Command
ERAST	Environmental Research Aircraft and Sensor Technology
ERBM	Extended Range Ballistic Missile
ERCS	Emergency Rocket Communications System
ERADCOM	Electronic Research and Development Command
ERDAS	Earth Resources Data Analysis System
ERF	Early Reinforcing Force
ERIN	Electronic Radio Intercept Network (USCS)
ERINT	Extended Range Intercept Missile
ERIR	Electronic Reconnaissance Intercept Report
ERIS	Exo-atmospheric Reentry Vehicle Interception System
EROS	Earth Resources Observational System
ERP	Effective Radiated Power
ERPHO	Earth Resources Photographic Satellite
ERRS	Emergency Regional Reporting System
ERS	(1) Emergency Relocation Site; (2) Earth Resources Satellite
ERSSO	Emergency Reaction Special Security Officer
ERT	Executive Reference Time
ERTM	Electronic Intelligence Request Tasking Message
ERTS	Earth Resources Technology Satellite
ERTZ	Equipment Radiation TEMPEST Zone
ERW	Enhanced Radiation Weapon

ES	(1) Emplacement Site; (2) Exploitation Support; (3) Electronic Warfare Support; (4) Expert System; (5) Electronic Support
ESA	(1) European Space Agency; (2) Electronically Steered Antenna
ESAA	European Special Activities Area (U.S. Air Force)
ESAC	El Salvador Analysis Cell
ESAF	European Special Activities Facility
ESAMS	Enhanced Surface-to-Air Missile Simulation
ESAR	Enhanced Synthetic Aperture Radar
ESC	Electronic Security Command (U.S. Air Force)
ESD	(1) Electronic Systems Division; (2) Ephemeris Support Data; (3) Exploitation Support Section (JSIPS)
ESF	(1) Environmental Scale Factor; (2) Extended Superframe Formatted
ESG	(1) Electronic Security Group; (2) Exploitation Steering Group
ESI	Extremely Sensitive Information
ESIAC	Electronic Satellite Image Analysis Center
ESJ	Escort Jamming
ESM	(1) Electronic Warfare Support Measures: (2) Electronic Support Measures; (3) Electronic Security Measures
ESMC	Eastern Space and Missile Center
ESMT	External Supply Management Tools
ESP	Emergency Special Measures
ESR	ELINT Summary Report
ESRO	European Space Research Organization
ESS	(1) Electronic Security Squadron; (2) ELINT Support System; (3) Exploitation Support Segment; (4) Exercise Support Subsystem; (5) Electronic Switching System; (6) Exploitation Support Section (JSIPS)
ESSA	(1) Expert System for Situation Assessment; (2) Environmental Satellite Service Administration
ESSM	Electronic Shop, Shelter-Mounted
Est	Estimated
ESV	Earth Satellite Vehicle
ESW	Electronic Security Wing
ET	(1) Enhanced Terminal; (2) Earth Terminal; (3) Embedded Training
ETA	(1) Estimated Time of Arrival; (2) Equivalent Target Area
ETAC	Enlisted Terminal Attack Controllers
ETAP	Education Training Awareness Program
ETAWG	ELINT Technical Analysis Working Group
ETC	(1) Estimated Time of Completion; (2) Et Cetera
ETD	(1) Estimated Time of Departure; (2) Effective Transfer Date
ETDS	Elapsed Time Distribution System
ETF	Enhanced Tactical Fighter
ETHICS	European Theater High Capacity Intelligence Communications System
ETI	Estimated Time of Impact

ETIBS	Enhanced Tactical Information Broadcast Service
ETII	External-to-Internal Interface
ETIWCS	European Theater Intelligence Warning and Communications System
ETL	(1) Endorsed Tools List; (2) Engineer Topographic Laboratories
ETO	(1) European Theater of Operations; (2) Earth-To-Orbit
ETP	(1) Extended Tether Program; (2) Enhanced Thermal Protection
ETPL	Endorsed TEMPEST Products List
ETR	(1) Estimated Time of Return; (2) Eastern Test Range
ETRAC	Enhanced Tactical Radar Correlator
ETRO	Estimated Time Return to Operation
ETS	(1) European Telephone System; (2) Estimated Time of Separation; (3) Expiration of Term of Service; (4) Earth Technology Satellite; (5) Engineer Test Satellite
ETSC	Electronic and Telecommunications Subcommittee
ETSS	Electronic Telecommunications Switching System
ETTP	EUCOM Tactics, Techniques and Procedures
ETUT	Enhanced Tactical User Terminal
EU	Expenditure Unit
EUCI	Endorsed for Unclassified Cryptographic Information
EUCOM	U.S. European Command
EUCOM/JIC	(1) U.S. European Command/Joint Intelligence Command; (2) EUCOM Joint Intelligence Center
EUDAC	European Defense Analysis Center
EUF	ECME User Facility
EUL	Economically Useful Life
EUMETSAT	European Meteorological Satellite (Organization)
EURATOM	European Atomic Energy Community
EUSA	Eighth U.S. Army (Korea)
EUSC	Effective United States Controlled
EUTE	Early User Test & Evaluation
EUTELSAT	European Telecommunications Satellite (Organization)
EUV	Extreme Ultraviolet
EUVE	Extreme Ultraviolet Explorer
EV	Enforcement Vector
EVA	Extra-Vehicular Activity
EVC	DoD Evasion Chart
EVO	Event Verification Officer
EVR	Enemy Vulnerability Report
EVS	Electronic Visual Communications
EW	(1) Electronic Warfare; (2) Early Warning
EW/GCI	Early Warning/Ground Control Intercept
EWAC	Electronic Warfare Anechoic Chamber
EWAS	Electronic Workorder Accounting System

EWC	(1) Electronic Warfare Center; (2) Electronic Warfare Coordinator
EWCC	Electronic Warfare Coordination Center
EWCM	Electronic Warfare Coordination Module
EWCS	Electronic Warfare Control System
EWIR	Electronic Warfare Integrated Reprogramming
EWIRS	Electronic Warfare Integrated Reprogramming System
EWMIS	Electronic Warfare Management Information System
EWMS	EW Mission Summary
EWO	(1) Electronic Warfare Officer; (2) Emergency War Order
EWOPFAC	Electronic Warfare Operating Facility
EWR	(1) Early Warning Radar; (2) Electronic Warfare Reprogramming
EWRL	Electronic Warfare Reprogrammable Library
EWS	Electronic Warfare Support
EWSE	EW Support Element
EWSM	Electronic Warfare Support Measures
EWSO	EW Staff Officer
EXCRIT	Exercise Critique System
EXDEF	Exercise Deficiency Program
EXCAP	Exercise Capability (simulator)
EXCOM	Community Executive Committee
ExDir/ICA	Executive Director for Intelligence Community Affairs
EXDIS	Exclusive Distribution (Pneumatic Tube Message Precedence)
EXEC	Executive
EXERTAS	Exercise Timeline Analysis System
EXFIL	Exfiltration
EXO	Exoatmosheric
EXOPLAN	Exercise Operations Plan
EXPER	Experience
EXPL	Exploitation
EXPLAN	Exercise Plan
ExPReS	Expoitation Process Reengineering Study
EXRAND	Exploitation Research and Development (COMIREX)
EXSCEN	Exercise Scenario System
EXSUBCOM	Exploitation Subcommittee (COMIREX)
EXSUM	Executive Summary
EXTAC	Experimental Tactics

F

F	(1) Fahrenheit; (2) Frequency
FA	(1) Frontal Aviation (FSU); (2) Field Artillery; (3) Forward Area; (4) Functional Architecture; (5) Frequency Agile; (6) Full Accounting; (7) Feasibility Assessment
FAA	(1) Federal Aviation Agency; (2) Federal Aviation Administration; (3) Foreign Assistance Act
FAAD C3I	Forward Area Air Defense Command, Control, Communications and Intelligence
FAADS	Forward Area Air Defense System
FAAR	Forward Area Alerting Radar
FAARP	Forward Area Armament and Refuel Point
FAAS	Foreign Affairs Administrative Support
FAC	(1) Forward Air Control (Controller); (2) Facilities
FACP	(1) Forward Air Control Post; (2) Forward Air Control Party
FACSFAC	Fleet Air Control and Surveillance Facility
FAD	(1) Fleet Air Defense; (2) Force Activity Designator; (3) Field Arbitrary Designators
FADOC	Future Air Defense Operation Concept
FADS	Foreign Area Data System
FAE	Fuel Air Explosive
FAF	Fast Access Format
FAFIC	Federal Armed Forces Intelligence Center (FRG)
FAI	Fuel Air Incendiary Concussion Bomb
FAIO	Field Artillery Intelligence Officer
FAISA	FORSCOM Automated Intelligence Support Activity
FAISS	FORSCOM Automated Intelligence Support System
FALD	Field Administration and Logistics Division
FAM	Functional Area Model
FAME	FORSCOM Automated Modernization Effort
FAMP	Foreign Army Materiel Production
FAMS	Fleet Ocean Surveillance Information Center Analytical Maritime Summary
FAMSIM	Family of Simulation
FANS	Friendly Allied Nation Support Network
FANT	French Atmospheric Nuclear Test
FAO	(1) Foreign Area Officer; (2) Forward Area of Operations; (3) Food and Agricultural Organization (UN)
FAPC	Food and Agriculture Planning Committee (NATO)
FARP	Forward Area Refuel Point
FARRFAA	Air Replacement Radar
FARRP	Forward Area Rearming and Refueling Point
FAS	(1) (U.S.) Foreign Agriculture Service; (2) Frequency Assignment Subcommittee
FAST	(1) Fleet Antiterrorist Support Teams; (2) Forward Area Support Team; (3) Forward Area Support Terminal
FAST-I	Forward Area SID and TRAP-Improved

FAST/I2	Improved FAST/I
FASTC	Foreign Aerospace Science and Technology Center (archaic, now NAIC)
FASTFAX	Tactical Digital Facsimile
FASTL	Future Analytic Strategic Target List
FAV	(1) Field Assistance Visit; (2) Fast Attack Vehicle
FAX	Facsimile
FB	Fighter Bomber
FBA	Fighter Bomber Attack
FBH	Force Beachhead
FBI	Federal Bureau of Investigation
FBIS	Foreign Broadcast Information Service
FBM	Fleet Ballistic Missile
FBR	Fast Breeder Reactor
FBS	(1) Forward-Based Systems; (2) Federal Border Service
FC	(1) Fire Control; (2) Fractional Coverage
FCA	Foreign Counterintelligence Activity
FCB	Functional Control Board
FCC	(1) Fleet Command Center; (2) Federal Communications Commission; (3) Fighter Control Center; (4) Fire Coordination Center
FCE	Forward Control Element
FCFS	First Come, First Served
FCG	Foreign Clearance Guide (military)
FCG2	FORSCOM G2
FCI	Foreign Counterintelligence
FCIAD	FORSCOM Component Intelligence Architecture Document
FCIP	Foreign Counterintelligence Program
FCISD	FORSCOM Component Intelligence Strategy Document
FCITP	Foreign Counterintelligence and International Terrorism Program (FBI)
FCITTP	FORSCOM Component Intelligence Tactics, Techniques and Procedures
FCLP	FORSCOM Command Language Program
FCO	Facility Control Office
FCRC	Federal Contract Research Center
FCS	(1) Fire Control System; (2) Flight Control System; (3) (U.S.) Foreign Commercial Service
FCSE	Forward Control Support Element
FCT	Foreign Comparative Test
FCZ	Forward Combat Zone
FD	Functional Design
F/d	Ratio of focal-length to diameter (of reflector type antennas)
FDB	Fleet Database
FDBM	Functional Data Base Manager
FDBPS	Fleet Data Base Production System

FDC	Fire Direction Center
FDDAC	Foreign Denial and Deception Analysis Committee
FDDI	Fiber Distributed Data Interface
FDDS	Flag Data Display System
FDIU	Fill Device Interface Unit
FDM	Frequency Division Multiplexing
FDMA	Frequency Division Multiple Access
FDO	Foreign Disclosure Officer
FDOA	Frequency Difference of Arrival
FDR	Foreign Disclosure Representative
FDT&E	Force Development Test & Experimentation
FDU	Force Design Update
FDW	Forward Deployed Workstation
FDX	Full Duplex
FEA	Front End Analysis
FEAF	Far Eastern Air Forces
FEBA	Forward Edge of the Battle Area
Fed	Federal Reserve System
FEDS	Front End Distribution System
FEDSIM	Federal Computer Performance Evaluation and Simulation Center
FEL	Free Electron Laser
FEMA	Federal Emergency Management Agency
FEMD	Far East Military District
FEMP	Front End Message Processors
FEP	(1) Front End Processor; (2) FLTSATCOM EHF Package
FERS	Federal Employees Retirement System
FET	Field Effect Transistor
FETVD	Far East Theater of Military Operations
FEWS	Future Early Warning System
FEWSG	Fleet Electronic Warfare Support Group
FF	Frigate
FFA	Free-Fire Area
FFAR	Folding-Fin Aerial Rocket
FFED	FIREFINDER Elevation Data
FFG	Guided-Missile Frigate
FFGH	Guided-Missile Aviation Frigate
FFGN	Nuclear-Powered Guided-Missile Frigate
FFH	Aviation Frigate
FFHGN	Nuclear-Powered Guided-Missile Aviation Frigate
FFHN	Nuclear-Powered Aviation Frigate
FFL	Corvette
FFLG	Guided-Missile Corvette
FFM	Full Face Mask
FFN	Fleet Flash Net

FFR	Radar Picket Frigate
FFS	(1) Fixed Field Site; (2) Formatted File System
FFT	Training Frigate
FGHQ	Fighter Group Headquarters (Canada)
FGN	Foreign
FH	Frequency Hopping
FH/DS	Frequency Hopping/Direct Sequence
FI	(1) Finished Intelligence; (2) Foreign Intelligence
FI&SS	Foreign Intelligence and Security Service(s)
FIA	Foreign Intelligence Agency
FIC	(1) Fleet Intelligence Center; (2) FORSCOM Intelligence Center
FICEURLANT	Fleet Intelligence Center, Europe and Atlantic
FICM	Fleet Intelligence Collection Manual
FICPAC	Fleet Intelligence Center, Pacific
FID	(1) Foreign Internal Defense; (2) Force Integration Division
FIDB	Fundamental Intelligence Database
FIE	Foreign Intelligence Element
FIG	Figure
FIIC	Force Imagery Interpretation Center
FIIU	Force Imagery Interpretation Unit
FIM	Force Integration Master Planner
FIN	(1) Fixed-Site Intelligence Network; (2) Financial
FINPLAN	Financial Plan
FIO	Foreign Intelligence Officer
FIP	(1) Force Improvement Plan; (2) Federal Information Processing
FIPC	Foreign Intelligence Priorities Committee
FIPS	(1) Federal Information Processing Standard; (2) Fleet Intelligence Production System
FIR	Field Investigative Region
FIRCAP	Foreign Intelligence Requirement Capabilities and Priorities
FIRE	Fused Intelligence Report in Europe
FIRF	Future Information Requirements Forecast
FIRMS	Foreign Intelligence Relations Management System
FIROPS	Freedom of Air Operations
FIRST	Fleet Intelligence Reserve Support Team
FIRSTEURLANT	Fleet Intelligence Reserve Support Team, Atlantic
FIRSTPAC	Fleet Intelligence Reserve Support Team, Pacific
FIS	(1) Foreign Instrumentation Signals; (2) Foreign Intelligence Service
FISA	Foreign Intelligence Surveillance Act
FISAP	FMFPac Intelligence Sub-Architecture Plan
FISINT	(1) Foreign Instrumentation and Signature Intelligence; (2) Foreign Instrumentation Signals Intelligence
FISS	Foreign Intelligence and Security Services
FIST	(1) Fleet Imagery Support Terminal; (2) Fire Support Team

FIST-T	Transportable FIST
FITCPAC	Fleet Intelligence Training Center, Pacific
FITD	FORSCOM Intelligence Training Detachment
FITWING	Fighter Wing
FLA	Foreign Launch Assessment
FLAGE	Flexible Lightweight Agile Guided Experiment
FLC	Foreign Language Committee
FLEETSATCOM	Fleet Satellite Communications
FLENUMOCEANCEN	Fleet Numerical Oceanography Center (U.S. Navy)
FLEX	Force-Level Execution System
FLI	Force-Level Information
FLIR	Forward-Looking Infrared (Radar)
FLO	Foreign Liaison Office
FLOT	Forward Line of Troops
FLR	Forward-Looking Radar
FLRA	Federal Labor Relations Authority
FLSG	Force Logistics Support Group
FLT	Fleet; Flight
FLTBCST	Fleet Broadcast
FLTCINC	Fleet Commander in Chief
FLTSAT	Fleet Satellite
FLTSATCOM	Fleet Satellite Communications System
FLTSEVOCOM	Fleet Secure Voice
FM	(1) Frequency Modulation; (2) Foreign Materiel; (3) File Maintenance; (4) Factory Marking(s); (5) Functional Manager; (6) Field Manual; (7) From; (8) Comptroller
FMA	(1) Foreign Materiel Acquisition; (2) Foreign Media Analysis
FMAO	Foreign Materiel Acquisition Operation
FMAR	Foreign Materiel Acquisition Requirement
FMAS	Foreign Media Analysis Subsystem
FMC	(1) Field Maintenance Center; (2) Force Mobile Command
FME	Foreign Materiel Exploitation
FMEC	Foreign Materiel Exploitation Catalogue
FMEP	Foreign Materiel Exploitation Program
FMF	Fleet Marine Force(s)
FMFLANT	Fleet Marine Force, Atlantic
FMFM	Fleet Marine Field Manual
FMFPAC	Fleet Marine Force, Pacific
FMIB	Foreign Materiel Intelligence Board
FMIG	Foreign Materiel Intelligence Group
FMIS	Force Management Information System
FMLM	French Military Liaison Mission
FMOCC	Fleet Mobile Operations Command Center
FMP	Foreign Materiel Program
FMPCP	Foreign Military Personnel Contact Program

FMPRB	Foreign Military Program Review Board
FMRL	Foreign Materiel Requirements List
FMs	Defense Intelligence Functional Managers
FMS	Foreign Military Sales
FMSF	Foreign Military Sales Financing
FMTV	Family of Medium Tactical Vehicles
FN	Foreign National
FNOC	Fleet Numerical Oceanographic Center
FNU	First Name Unknown
FO	Forward Observer
F/O	Fiber-Optics
FOA	(1) Field Operating Agency; (2) Forward Operating Area
FOAMP	Foreign Aerospace Materiel Production
FOAP	Foreign Aircraft Production
FOB	(1) Forward Operating Base; (2) Foreign Order of Battle
FOBS	Fractional Orbital Bombardment System
FOC	(1) Final Operational Capabilities; (2) Full Operational Capability; (3) FORSCOM Operations Center; (4) Full Operating Capacity
FOCI	Foreign Owned, Controlled or Influenced
FOCUS	(1) Interagency Review of Defense Attache Offices; (2) FORSCOM Objective Communications System
FOD	Foreign Object Damage
FOFA	Follow-on Forces Attack
FofF	Field of Fire
FOG	Fiber-Optics Guided
FOGM	Fiber-Optic Guided Missile
FOI	Freedom of Information
FOIA	Freedom of Information Act
FOL	(1) Forward Operating Location; (2) Family of Loudspeakers
FOLAN	Fiber-Optic Local Area Network
FOLPEN	Foliage-Penetrating
FOM	Figure of Merit
FOMA	Foreign Military Assistance
FOMCAT	Foreign Materiel Catalogue
FOMP	Foreign Missile Production
FONS	Fleet Operational Needs Statement for Intelligence
FOP	Forward Observation Post
FORDTIS	Foreign Disclosure Technical Information System
FORECON	Force Reconnaissance
FORGE	Force Generation
FORMAT	Foreign Materiel
FORMDEPS	FORSCOM Mobilization and Deployment Planning System
FORMICA	Foreign Military Intelligence Collection Activity
FORMMS	Foreign Materiel Management System

FORSCOM	U.S. Forces Command
FORSTAT	Force Status and Identity Report
FORT	Force Trends Data Base
FORTRAN	Formula Translator
FOSCAS	Foreign Ship Construction and Shipyards
FOSD	Family of Sabotage Devices
FOSIC	Fleet Ocean Surveillance Information Center
FOSIC-E	Fleet Ocean Surveillance Information Center, Europe
FOSICLANT	Fleet Ocean Surveillance Intelligence Center, Atlantic
FOSICPAC	Fleet Ocean Surveillance Information Center, Pacific
FOSIF	Fleet Ocean Surveillance Information Facility
FOSIF Rota	Fleet Ocean Surveillance Information Facility, Rota
FOSIF/WESTPAC	Fleet Ocean Surveillance Information Facility, Western Pacific
FOTARS	Follow-On Tactical Reconnaissance System
FOT&E	Follow-On Test and Evaluation
FOTELSYS	Foreign Telecommunications Systems
FOTRS	Follow-On Tactical Reconnaissance System
FOUO	For Official Use Only
FOV	Field of View
FP	(1) Fire Position; (2) Field Post; (3) Force Package
FPA	(1) Federal Preparedness Agency; (2) Focal Plane Array; (3) Force Projection Army
FPB	Fast Patrol Boat
FPE	Force Planning Estimate
FPF	Final Protection Fire
FPI	(1) Foreign Positive Intelligence; (2) Federal Process Improvement
FPIR	Force Protection Information Report
FPL	Fire Protective Line
FPN	Field Post Number
FPO	Fleet Post Office
fps	Feet Per Second
FPTOC	Force Projection Tactical Operations Center
FPU	Floating Point Unit
FQ&P	Flying Qualities and Performance
FRAG	Fragmentary Order
FRAGO	Fragmentary Order
FRD	(1) Federal Research Division (Library of Congress); (2) Formerly Restricted Data; (3) Functional Requirements Document
FREQ	Frequency
FRG	Federal Republic of Germany
FRIES	Fast Rope Insertion Extraction System
FRIF	Finished Recurring Intelligence File
FROG	Free Rocket Over Ground
FROKA	First Republic of Korea Army

FROSS	Foreign Reliance on Space Systems
FRPG	Facility Reference Point Graphic
FRR	Frequency Resource Records
FRS	(1) Fleet Readiness Squadron; (2) Federal Research Service; (3) Forward Recording Site
FRY	Former Republic of Yugoslavia
FRYM	Former Republic of Yugoslavia-Macedonia
FS	(1) File Server; (2) Fire Support
F3S	Field Station Support System
FSAIS	FICEURLANT SCI Analyst Information System
FSB	(1) Fleet Satellite Broadcast (of FLTSATCOM); (2) Forward Staging Base; (3) Fire Support Base
FSBS	Fleet Submarine Broadcast System
FSCC	Fire Support Coordination Center
FSCL	Fire Support Coordination Line
FSCOORD	Fire Support Coordinator
FSD	(1) Field Support Division; (2) Forward Support Detachment
FSE	Fire Support Element
FSHB	Fallout Safe Height of Burst
FSI	Foreign Service Institute
FSIC	Forward Sensor Interface and Control
FSK	(1) Field Station, Korea; (2) Frequency Shift Keying
FSM	Federated States of Micronesia
FSO	(1) Foreign Service Officer; (2) Fire Support Officer
FSOC	Fairchild Satellite Operations Center
FSOF	Forward Special Operations Facility
FSP	Fire Support Plan
FSRS	Functional Security Requirements Specification
FSS	(1) Fast Sealift Ship; (2) FAISS SID System; (3) Fixed Satellite Services
FSSG	Force Service Support Group (USMC)
FSST	Forward Space Support in Theater
FST	(1) Future Strategic Targets; (2) Future Soviet Tank
FSTC	Foreign Science and Technology Center (archaic; now NGIC)
FSTS	Federal Security Telephone Service
FSU	Former Soviet Union
FSV	Fire Support Vehicle
FSVS	Future Secure Voice System
FSWDS	Fixed-Site Warning & Detection System
FT	(1) Fort; (2) Foot
FT-1	Fractional T-1
FTA	(1) Field Training Area; (2) Functions, Tasks, and Activities
FTAM	File Transfer Access Management
FTC	(1) Fast Time Constant (ECCM); (2) Federal Trade Commission
FTD	Foreign Technology Division (USAF)

FTDB	Foreign Technology Data Base
FTI	Fixed Target Indicator
FTL	Future Target List
FTLS	(1) Future Target List-Strategic; (2) Formal Top-Level Specification
FTM	Full-Time Manning
FTP	File Transfer Protocol
FTPS	FORSCOM Topographic Production System (Facility)
FTR	Fighter
FTS	(1) Fleet Telecommunications System; (2) Federal Telecommunications System; (3) Federal Telephone System; (4) Flight Training Squadron
FTS 2000	Federal Telephone System 2000
FTSC	Fleet Technical Support Center
FTU	Forecast Tactical Unit
FTX	Field Training Exercise
FU	Forecast Unit
FUD	Full Unit Designator
FUE	First Unit Equipped
FUNT	French Underground Nuclear Test
FUSS	Fleet Undersea Surveillance System
FUWOB	Forward Unconventional Warfare Operations Base
FV	Fighting Vehicle
FVS	Foreign Visits System
FW	(1) Fighter Wing; (2) Fixed-Wing
FWAIS	Free-World Air Intelligence Study
FWAOB	Free-World Air Order of Battle
Fwd	Forward
FWE	Foreign Weapons Evaluation
FWIC	Fighter Weapon School Intelligence Course
FWVP	Fallout Wind Vector Plot
FY	Fiscal Year
FYDP	(1) Fiscal Year Defense Program/Plan; (2) Five-Year Defense Program; (3) Future Years Defense Program
FYI	For Your Information
FYIP	Five-Year Intelligence Plan
FYMOP	Five-Year Master Objectives Plan
FYP	Five-Year Plan (FSU)
FYROM	Federal Yugoslav Republic of Macedonia

G

G	Gain
G1	Assistant Chief of Staff, G1 (Personnel)
G2 or G-2	(1) Assistant Chief of Staff, G2 (Intelligence); (2) Army or Ground Directorate of Intelligence; (3) General Corps Staff Intelligence Officer
G3	Assistant Chief of Staff, G3 (Operations and Plans)
G4	Assistant Chief of Staff, G4 (Logistics)
G5	Assistant Chief of Staff, G5 (Civil Affairs)
G6	Director(ate) of C4
G8	Director(ate) of Resource Management
GA	Ground Attack
GaAs	Gallium Arsenide
GACC	Ground Attack Coordination Center
GAD	Guards Artillery Division
GADT	Ground/Air Defense Threat
GAF	Ground Alert Facility (of PAC ABNCP)
GAFIA	German Armed Forces Intelligence Agency
GALE	Generic Area Limitation Environment
GALS	FSU Satellite (“Horizon”)
GAMO	Ground and Amphibious Military Operations
GAO	General Accounting Office
GAS	(1) Gray Area Systems; (2) Getaway Special
GAT	(1) Government Acceptance Test; (2) Guidance, Apportionment, and Targeting
GATT	General Agreement on Tariffs and Trade (UN)
GB	(1) Gigabyte; (2) Guardband
GBCS(-L or -H)	Ground-Based Common Sensor (-Light or -Heavy)
GBI	Ground-Based Interceptor
GBL	Ground-Based Laser
GBMD	Global Ballistic Missile Defense
GBR	Ground-Based Radar
GBS	Global Broadcast System
GBU	Guided Bomb Unit
GC	Gun Camera
GCA	Ground Controlled Approach
GCC	(1) Government Control Center; (2) Ground Component Commander; (3) Gulf Cooperation Council; (4) Global Control Center
GCCS	(1) Ground Command and Control System; (2) Global Command and Control System
GCDCAL	Great Circle Distance Calculator
GCE	Ground Combat Element
GCI	Ground-Controlled Intercept
GCN	Ground Communications Network
GCNTTY	Ground Communications Network Teletype

GCP	Ground-Controlled Processor
GCP-E	Ground-Controlled Processor-ELINT
GCS	(1) Graphics Compatibility System; (2) Ground Control Station; (3) Global Connectivity Services; (4) Global Communications System
GCSS	Global Combat Support System
GDA	Gimbaled Dish Antenna
GDBI	Generic Data Base Interface
GDBMS	Generic Data Base Management Server
GDIC	General Defense Intelligence Community
GDIP	General Defense Intelligence Program
GDIPP	General Defense Intelligence Proposed Program
GDL	Gas Dynamic Laser
GDOP	Geometric Dilution of Precision
GDP	(1) General Defense Plan; (2) Gross Defense Product; (3) Ground Defense Position; (4) Gross Domestic Product
GDPS	Ground Data Processing System
GDRS	Ground Data Reduction System
GDS	(1) General Declassification Schedule; (2) FSU Guards; (3) Group Decision Support
GDSS	Global Decision Support System
GDT	Ground Data Terminal
Gen	General
GEM	Ground Effects Machine
GEN	(1) Generation; (2) General
GENIC	German National Intelligence Cell (NATO)
GENREP	General Reports
GENSER	General Service (Communications)
GEO	Geosynchronous Earth Orbit
GEODIS	Geographic Display
GEODSS	Ground-Based Electro-Optical Deep-Space Surveillance System
GEOFILE	(1) Geographic Locations Code File System; (2) Geolocation File (JOPES)
GEOREF	Global Reference System, a worldwide position reference system that may be applied to any map or chart graduated in latitude and longitude regardless of projection.
GEOSAT	Geological Satellite
GEP	Ground Entry Point
GEPS	Generic Electronic Publishing System
GES	Ground Entry Station
GFAC	Ground Forward Air Controller
GFCP	Generic Front-End Communications Package
GFE	Government Furnished Equipment
GFTD	Global Force Trends Data Base
GFR	Gap Filler Radar
GGI&S	Global Geospatial and Information Services
GHz	Gigahertz

GIGSTER	NSA Video Teleconferencing System
GIIPS	Geographic Installation Intelligence Production Specifications
GIITS	General Intelligence Imagery Training System
GIN	Greenland-Iceland-Norway
GIPD	(1) General Intelligence Production Detachment; (2) General Intelligence Production Division
GIPMIS	General Intelligence Production Management Information System
GIPS	Geographic Installation Intelligence Production Specifications
GIPSY	Graphics Information or Presentation System
GIS	Geographical Information System
GIST	Graphical Intelligence Support Terminal
GITAC	General Intelligence Training Advisory Committee
GITC	General Intelligence Training Center
GITS	General Intelligence Training System
GIUK	Greenland-Iceland-United Kingdom
GKNT	State Committee for Science and Technology (FSU)
GKS	Graphics Kernel System
GL	Grenade Launcher
GLCM	Ground-Launched Cruise Missile
GLLD	U.S. Ground Laser Locator Designator (for COPPERHEAD)
GLMX	Geological Multi-Source Exploitation (System)
GLOBIXS	Global Information Exchange System
GLOMR	Global Low-Orbiting Message Relay
GLONASS	Global Navigation Satellite System
GM	Guided Missile
GMD	Global Missile Defense
GMF	Ground Mobile Forces
GMFP	Global Military Force Policy
GMFSC	Ground Mobile Force Satellite Communications
GMI	(1) General Medical Intelligence; (2) General Military Intelligence
GMIPP	General Military Intelligence Production Plan
GMIT	Ground Military Intelligence Team (ROK)
GMRD	Guards Motorized Rifle Division (FSU)
GMS	(1) Ground Mobile System; (2) Geostationary Meteorological Satellite; (3) Ground Mission Supervisor
GMT	Greenwich Mean Time (Zulu)
GMTI	Ground Moving Target Indicator GNAS Gateway Network Access System
GNC	Global Navigation Chart
GND	Ground
GNP	Gross National Product
GNS	Global Network Segment
GNST	Glossary of Naval Ship Types
GO()	Government of (Name of Country)

G-O	Office of Law Enforcement and Defense Operations (USCG)
G-OINS	Intelligence Division (USCG/G-O)
G-OIS	Investigations and Security Division (USCG/G-O)
GOB	Ground Order of Battle
GOC	(1) General Officer Commanding (UK); (2) Government of Canada; (3) Global Operations Center
GOCO	Government Owned Contractor Operated
GOES	Geostationary Operational Environmental Satellites
GOLDS	General On-Line Display System
GOLDWING	Army HF Radio; HF communications system for meteorological and other operations
GOMS	Geostationary Operational Meteorological Satellite
GOP	Generated Option Plan
GOR	General Operational Requirement
GORB	General Officer Review Board
GOS	Grade of Service
GOSC	General Officer Steering Committee
GOSIA	Government Open System Interconnect Architecture
GOSIP	Government Open Systems Interconnected Profile
GOSPLAN	State Planning Committee (FSU)
GOSSNAB	State Committee for Material-Technical Supply (FSU)
GOTS	Government Off-the-Shelf
GP	(1) Group; (2) General Purpose
GPALS	Global Protection Against Limited Strikes
GPEE	General Purpose Encryption Equipment
GPF	(1) General Purpose Forces; (2) Ground Processing Facility
gph	Gallons Per Hour
GP NAF	General Purpose Numbered Air Force
GPNDS	Global Positioning & Nuclear Detection System
GPO	Government Printing Office
GPS	(1) Global Positioning System; (2) Grid Producing Source; (3) Geographical Positioning System; (4) Ground Processing Stations
GPSCS	General Purpose Satellite Communications System
GR	(1) Graphical Reporting; (2) Gateway Router
GRAD	Graduate
GRANITE SENTRY	Proper Name of System
GRID	Brand of Portable PC
GRIPF	GUARDRAIL Integrated Processing Facility
GRD	Ground Resolved Distance
GREEN FLAG	ACC live-fly electronic combat exercise
GRG	Gridded Reference Graphic
GRO	Gamma Ray Observatory
GROFIS	Ground Forces Intelligence Study
GRP	Glass Reinforced Plastic
GRT	Gross Registered Tonnage

GRU	FSU General Staff Intelligence Organization
GS	(1) General Staff, (2) General Support; (3) Geological Survey; (4) General Schedule; (5) General Service; (6) Government Service (Federal Civil Service); (7) Ground Station; (8) Government Civilian
GSA	General Services Administration
GSD	(1) Ground Sample Distance; (2) Graphical Situation Display
GSE	Ground Support Equipment
GSF	(1) Ground Support Fighter (FSU); (2) Group of Soviet Forces; (3) Ground Station Facility
GSFC	Goddard Space Flight Center
GSFG	Group of Soviet Forces Germany
GSFM	Group of Soviet Forces Mongolia
GSICS	General Support Interim Contractor Support
GSM	(1) Ground Support Module (JSTARS); (2) Ground Station Module
GSOAF	GGI&S Special Operations Applications Facility
GSP	General Strike Plan
GSR	(1) General Support Reinforcing; (2) Ground Surveillance Radar
GSRS	U.S. General Support Rocket System
GSS	(1) Global Support System; (2) General System Specification
GST	(1) Ground Sensor Terminal; (2) Ground Station Terminal; (3) Ground Support Terminal
GSTS	Ground-Based Surveillance and Tracking System
GSTN	General Switched Telephone Network
GSU	Geographically Separated Unit
G/T	Ratio of Antenna Gain to Noise Temperature
GTA	Government Training Aid
GTAB	Global Transportation Analysis Bulletin
GTD	Guards Tank Division (FSU)
GTN	Global Transportation Network
GTS	Global Telecommunications Service
GTC	Gas Turbine Compressor
GTTC	Goodfellow Technical Training Center
GUI	Graphics User Interface
GW	(1) Guided Weapon; (2) Gateway; (3) Guerrilla Warfare
G/W	Gateway
GWC	Global Weather Control
GWEN	Ground Wave Emergency Network
GWIC	Great Wall Industries Corporation (China)
GWIP	Global Weather Intercept Program
GWP	General Work Plan
GW/R	Gateway/Router
GWS	Gaps, Weaknesses, and Shortfalls (also GW&S)
GYRO	Gyroscope or Gyroscopic
GZ	Ground Zero

H

H	Symbol for the magnetic field of the propagated radio wave
H_2O	Critical life-essential liquid, commonly known as water
HA	Humanitarian Assistance
HAA	Helicopter Alighting Area
HAB	(1) High Altitude Burst; (2) High Altitude Bombing; (3) High Air Burst; (4) Hardened Aircraft Bunker
HAC	(1) House Appropriations Committee; (2) Historical Area Coverage
HACC	Humanitarian Assistance Coordination Center
HAE	High-Altitude Endurance
HAHO	High-Altitude High-Opening
HAIS	Hawaiian Air Intelligence System
HAL	Helicopter Light Attack
HALE	High-Altitude Long-Endurance
HALO	High-Altitude Low-Opening
HANE	High-Altitude Nuclear Effects
HANG	Hawaii Air National Guard
HARDLOOK	Special Data Analysis Product of NAVSPACECOM/N24
HARDS	High-Altitude Radiation Detection System
HARM	High-Speed Anti-Radiation Missile (AGM-88A)
HARV	Harassment Vehicle (Drone)
HAS	Hardened Aircraft Shelter
HASC	House Armed Services Committee
HATS	Heuristic Automated Transportation System
HATMD	High-Altitude Theater Missile Defense
HAV	(1) High Acceleration Vehicle; (2) Heavy Armored Vehicle (non-tactical)
HAWS	Hawaii Area Wideband System
HAZCON	Hazardous Condition
HAZMAT	Hazardous Materials
HB	High Burst
HBWP	Host-Based Word Processing
HC	HUMINT Committee
HCA	Humanitarian and Civic Assistance
HCC	HUMINT Contingency Cell
HCF	High Command of Forces
HCI/DV/AEX	Human-Computer Interface/Data Visualization/Automated Expansion
HCR	HUMINT Collection Requirement
HCS	Helicopter Combat/Search and Rescue
HCU	High Capacity Computer Unit
HD	Horizontal Ground Distance
HDL	Harry Diamond Laboratories
HDM	Hierarchical Development Methodology

HDO	Humanitarian Demining Operations
HDX	Half Duplex
HX	Half Duplex
HE	High Explosive
HEAT	High-Explosive AntiTank
HEC	Helicopter Element Coordinator
HEDI	High Endoatmospheric Defense Interceptor
HEF	Hostile Establishment File
HEI	High-Explosive Incendiary
HEL	High-Energy Laser
HELIP	HAWK European Limited Improvement Program
HELRATS	High Energy Laser Radar Acquisition & Tracking System
HELSTF	High-Energy Laser Systems Test Facility
HELW	High-Energy Laser Weapons
HELWING	Helicopter Wing
HEMP	High-Altitude Electromagnetic Pulse
HEMT	High-Electron-Mobility Transistor
HEO	(1) High-Earth-Orbit; (2) Highly Elliptical Orbit
HEP	High-Explosive Plastic
HERO	(1) Hazards of Electromagnetic Radiation To Ordnance; (2) Historical Evaluation and Research Organization
HERT	Headquarters Emergency Relocation Team
HES	Hardcopy Exploitation Systems
HESS	Hangul English Support System
HEST	High-Explosive Simulation Technique
HET	Heavy Equipment Transporter
HF	(1) High Frequency; (2) Height Finder; (3) Hydrogen Fluoride
HFE	Human Factors Engineering
HFA	High-Frequency Antenna
HF/DF	High-Frequency Direction-Finding
HFE	Heavy-Fuel Engine
HFEA	Human Factors Engineering Assessment
HFP	Host Front-End Protocol
HH	Hand-Held
HHC	Headquarters and Headquarters Company
HHD	Headquarters and Headquarters Detachment
HHS	(1) Headquarters and Headquarter Services; (2) Hasty Hide Shelter
HHW	Higher High Water
HIL	High Interest List
HI-PAR	High-Performance Precision-Approach Radar
HI-RES	High-Resolution
HIC	High-Intensity Conflict
HICOM	High Command (CINCPACFLT Voice Network)
HIDSS	Helmet-Integrated Display & Sight System

HIFAR	High-Frequency Fixed-Array Radar
HIMAD	(1) High- to Medium-Altitude Defense; (2) High to Medium Altitude Adjustment
HIMS	HUMINT Information Management System
HIP	Howitzer Improvement Program
HIRMS	Human Intelligence Requirements Management System
HIROCC	Hawaiian Islands Regional Operational Control Center
HIS	(1) Honeywell Information System; (2) Hostile Intelligence Services
HISP	Hostile Intelligence Service Profiler System
HIT	High-Interest Track
HITS	(1) Human Intelligence Tasking System; (2) Hawaii Information Transfer System
HJ	HONEST JOHN (U.S. Surface-to-Surface Rocket)
HL	Hand-Launched
HLA	Helicopter Landing Areas
HLA/DZ	Helicopter Landing Area/Drop Zone
HLA/DZS	Helicopter Landing Area/Drop Zone Study
HLLV	Heavy-Lift Launch Vehicle
HL-UAV	Hand-Launched Unmanned Aerial Vehicle
HLW	Higher Low Water
HLZ	Helicopter Landing Zone
HM	Helicopter Mine Warfare
HMC	HUMINT Management Center
HMCII	Higher Military Command, Interior and Islands (Greece)
HMF	Handbook of Military Forces
HMI	(1) Host-Message Interface; (2) Human-Machine Interface
HMMWV	High-Mobility Multipurpose Wheeled Vehicle
HMS	(1) Her Majesty's Ship; (2) HUMINT Management System
HMTV	Head-Mounted Thermal Vision
HN	Host Nation
HNAF	Host Nation Armed Forces
HNIS	Host Nation Intelligence Support
HNS	Host Nation Support
HNSC	House National Security Committee
HOB	Height of Burst
HOBO	Homing Optical Bomb
HOC	(1) History of Coverage; (2) HUMINT Operations Cell
HOCNET	HUMINT Operational Communications Network
HOE	Homing Overlay Experiment
HOIS	Hostile Intelligence Service(s)
HOJ	Home on Jam
HOL	High-Order Language
HOM	(1) Head of Media; (2) Head of Mission
HOTA	HUMINT Operational Tasking Authority

HOTOL	Horizontal Takeoff & Landing
HOTPHOTOREP	Hot Photographic Interpretation Report
HOTSIT	Hot Situation Message
how	Howitzer
HP	(1) Headquarters Pamphlet; (2) Horsepower
HPA	High-Power Amplifier
HPG	Hardcopy Products Group
HPM	High-Power Microwave
HPT	(1) High-Payoff Target; (2) High-Priority Target
HPSC	High-Performance Computing Research System
HPSCI	House Permanent Select Committee on Intelligence
HQ/HQS	Headquarters
HQDA	Headquarters, Department of the Army
HQJTF	Headquarters, Joint Task Force
HQMC	Headquarters, U.S. Marine Corps
HQMRHITS	Quarterly Management Report
HQ USAF	Headquarters, Department of the Air Force
HR	(1) High Resolution; (2) Humanitarian Relief Service
hr	Hour
HR/MR	Human Readable/Machine Readable (Data)
HRC	Human Resources Committee
HRCS	High-Resolution Camera System
HRMS	Human Intelligence Requirements Management System
HRPT	High-Resolution Picture Transmissions
HRR	High-Resolution Radar
HRS	(1) Hours; (2) Humanitarian Relief Service
HRTV	High-Resolution Television
HRU	Hardcopy Reconstruction Unit
HRV	High-Resolution Visible Range Instruments
HS	(1) Helicopter Squadron; (2) Home Station
HSD	HUMINT Support Detachment
HSE	HUMINT Support Element
HSE-E	HSE-Europe
HSE-SOCOM	HSE-USSOCOM
HSI	(1) Human Systems Integration; (2) Hyperspectral Imagery
H-SIP	H-Camera Spectral Improvement Program
HSLLADS	High Speed Low Level Aerial Delivery System
HSMS	Human Sources Management System
HSS	Health Service Support
HTACC	Hardened Tactical Air Control Center
HTKP	Hard-Target Kill Potential
HTLD	High-Technology Light Division
HTOHL	Horizontal Take-off and Horizontal Landing
HTML	Hypertext Markup Language
HUD	Heads-Up Display

HULTEC	Hull-to-Emitter Correlation
HUMINT	Human Resources Intelligence
HUMMV	High Utility Mobile Mechanized Vehicle
HUMRO	Humanitarian Relief Operations
HUS	Hardened Unique Storage
HUSK	Hardened Unique Storage Key
hv	Heavy
HVA	High Value Asset
HVAC	High-Voltage Air Conditioning
HVAP	High-Velocity Armor-Piercing
HVAPFSDS	High Velocity Armor-Piercing Fin-Stabilized Discarding-Sabot
HVAT	High-Velocity Antitank
HVF	Highly Volatile Fuel
HVIT	High Volume Information Transfer
HVT	High-Value Target
HW	(1) High Water; (2) Hardware
HWAS	High Wycombe Air Station
HWC	Hobart Walk-in Cooler
HW/SW	Hardware/Software
HWY	Highway
Hz	Hertz

I

i	Inclination
I2	Intelligence Information
IA	(1) Imagery Analyst; (2) Intelligence Assistant; (3) Initial Assessment; (4) Intelligence Analyst; (5) Intelligence Agent
IAA	Interagency Agreement
I&A	(1) Imagery and Analysis; (2) Identifcation and Authentication
IAB	Imagery Analysis Branch
IAC	(1) Intelligence Analysis Center; (2) Intelligence Advisory Committee; (3) Intelligence Analyst Course (DIA); (4) Information Analysis Centers
IAD	(1) Intelligence Analysis Division; (2) Integrated Air Defense
IADB	Inter-American Defense Board
IADS	Integrated Air Defense System
IAEA	International Atomic Energy Agency
IAG	(1) Intelligence Analysis Group (formerly ITAD); (2) Imagery Analysis Group
IAGC	Instantaneous Automatic Gain Control
IAGS	Inter-American Geodetic Survey
IAIPS	Integrated Automated Intelligence Processing System
IAM	Imagery Analysis Memorandum
IAMP	Imagery Acquisition and Management Plan
IAMS	Individual Aerial Mobility System
IAN	Imagery Analysis Notice
IAP	International Airport
IAPF	Inter-American Peace Force
IAR	Imagery Analysis Report
IAS	(1) Intelligence Access System; (2) Interactive Applications System; (3) Intelligence Analysis System
IAS WS	IAS Work Station
IASSA	INSCOM Automated Systems Support Activity
IAT	Intelligence Augmentation Team
IATA	International Air Transport Association
IAW	In Accordance With
IAWG	Interagency Working Group
IAWS	Improved Analyst Workstation
IBAC	Identity-Based Access Control
IBs	Issue Books
IBBS	Interim Brigade/Battalion Simulation
IBD	Intelligence Baseline Document
IBDTF	IBD Transaction Format
IBE	Field-Initiated BE Number
IBERLANT	Iberian Atlantic Area
IBIS	Imaging Background Limited Infrared System
IBM	International Business Machines

IBO	Intelligence Baseline Overview
IBOS	Intelligence Battlefield Operating System
IBS	(1) Interactive Beacon System; (2) Integrable Base Station; (3) Integrated Broadcast Service; (4) Intelsat Business Service; (5) Integrated Bridge System
IBSSIR	Background Signature Survey
IBTA	Integrated Battlefield Targeting Architecture
IBUR	Intelligence Bottom-Up Review
IC	(1) Intelligence Community; (2) Intelligence Collection; (3) Integrated Circuit; (4) Intelligence Center; (5) Irish Concern
IC/EC	Intelligence Community/Executive Committee
ICA	Intelligence Center Atlantic
ICAF	Industrial College of the Armed Forces
ICAO	International Civil Aviation Organization
ICAP	Improved Capabilities Program
ICARIS	Intelligence Communications Architecture and Requirements Information System
ICBM	Intercontinental Ballistic Missile
ICC	(1) Integrated Communications Center; (2) Intelligence Continuity Cell; (3) IMlNT Coordination Cell; (4) Intelligence Coordination Center (Coast Guard); (5) Initial Connectivity Capability
ICCC	International Council for Computer Communication
ICD	(1) Interface Control Document; (2) Intelligence Collection Division; (3) Initiative Communications Deception
ICDP	Intelligence Career Development Program
ICE	(1) Independent Cost Estimate; (2) Interface Control Element
ICEDEFOR	Iceland Defense Forces
ICES	International Cooperation in Ocean Exploration
ICF	(1) Intelligence Collection Flight; (2) Intelligence Contingency Funds; (3) Interconnect Facility
ICFTU	International Confederation of Free Trade Unions
ICIG	IDHSS CSSR Interface Guard
ICITAP	International Criminal Investigative Training and Assistance Program
ICL	Intelligence Coordination Cell
ICM	(1) Improved Conventional Munitions; (2) Intelligence Correlation Module; (3) Integrated Common Modules
ICMC	Intelligence Collection Management Course
ICOD	Intelligence/Information Cut-Off Date
ICOM	Integrated COMSEC (SINCGARS)
ICON	Image Communications and Operations Node
ICP	(1) Intelligence Collection Platform; (2) Interface Change Proposals; (3) Incremental Change Packages
ICPS	Intelligence Communications Processing Shelter
ICR	Intelligence Collection Requirement
ICRC	(1) Intelligence Contingency Readiness Center; (2) International Committee of the Red Cross
ICRS	Imagery Collection Requirements Subcommittee (COMIREX)

ICS	(1) Intercommunications System; (2) Intelligence Community Staff
ICTF	Interagency Crisis Task Force
ICTT	(1) Improved Commander's Tactical Terminal; (2) Interim Commander's Tactical Terminal
ICU	Interface Control Unit
ICV	Infantry Combat Vehicle
ICW	In Coordination With
ICWG	(1) Interface Control Working Group; (2) Imagery Coordination Working Group
ID	(1) Identification; (2) Infantry Division; (3) Intelligence Division
IDA	Institute for Defense Analysis
IDAD	Internal Defense and Development
IDB	(1) Integrated Data Base; (2) Inter-American Development Bank
IDB-II	PC-Based Integrated Data Base
IDBM	Integrated Data Base Maintenance
IDBR	Integrated Data Base Retrieval
IDBTF	Intelligence Data Base Transaction Format
IDC	Interagency Defector Committee
IDCSP	Initial Defense Communications Satellite Program
IDEAS	Intelligence Data Element Authorization Standards
IDES	Installation Damage Expectancy Summary
IDEX	Imagery Data Exploitation System
IDEX II	Imagery Data Exploitation System II
IDF	(1) Israeli Defense Force; (2) Installation Data File
IDHS	Intelligence Data Handling System
IDHS	IDHS for the mid-1990s
IDHS-2000	Intelligence Data Handling System for the Year 2000
IDHS-II	Intelligence Data Handling System, Second Iteration
IDHSC	Intelligence Data Handling System Communications
IDHSC-II	Intelligence Data Handling System Communications, Version II
IDIMS	Interactive Digital Image Manipulation System
IDIQ	Indefinite Delivery, Indefinite Quantity
IDIRA	Introduction to Defense Intelligence Research and Analysis (DIA)
IDL	Interoperable Data Link
IDM	Improved Data Modem
IDMS	IPAC Document Management System
IDN	Integrated Data Network
IDNX	Integrated Digital Network Exchange
IDP	Intelligence Data Processor
IDPS	(1) Imagery Data Processing System; (2) Integrated Deployable Processing System; (3) Interim Deployable Processing System
IDS	(1) Intrusion Detection System; (2) Infrared Detection Set
IDSCS	Initial Defense Satellite Communications System
IDSCP	Initial Defense Satellite Communication Program

IDSF	Intelligence Defector Source File
IDTT	Inactive Duty Training Travel
IDZ	Inner Defense Zone
IEA	International Energy Agreement
IEBL	Inter-Entity Boundary Line
IEC	(1) Imagery Exploitation Center; (2) Intelligence Exchange Conference
IED	(1) Improvised Explosive Device; (2) Imitative Electronic Deception
IEG	Imagery Exploitation Group
IEMATS	Improved Emergency Message Automated Transmission System
IEP	Independent Evaluation Plan
IEPG	Independent European Program Group
IEPR	Information Exchange and Processing Requirements Report
IER	Independent Evaluation Report
IES	Imagery Exploitation System
IESS	Imagery Exploitation Support Segment
IEW	Intelligence and Electronic Warfare
IEWCS	IEW Common Sensor
IEWD	Intelligence and Electronic Warfare Directorate
IEWFAM	IEW Functional Area Model
IEWSE	IEW Support Element
IEWTAC	IEW Technology Assessment Center
IEWTPT	IEW Tactical Proficiency Trainer
IF	(1) Interrogation Facility; (2) Identification Frequency; (3) Intermediate Frequency
IFAC	International Federation of Automatic Control
IFF	Identification, Friend or Foe
IFFN	Identification, Friend, Foe or Neutral
IFOR	Implementation Force (Operation JOINT ENDEAVOR)
IFOV	Instantaneous Field-of-View
IFPS	Interformation Position System
IFR	Instrument Flight Rules
IFRB	International Frequency Registration Board
IFS	Imagery File Server
IFTE	Integrated Family Test Equipment
IFV	Infantry Fighting Vehicle
IG	(1) Interagency Group; (2) Inspector General; (3) Intelligence Group (Air Force)
IGCP	Intelligence Guidance for COMINT Programming
IGD	Intelligence Guidance Document
IGR	Improved GUARDRAIL
IGRV	Improved GUARDRAIL V
IGS	Image Generation System
IGSM	Interim Ground Station Module
IGT	Interdepartmental Group on Terrorism

IGY	International Geophysical Year
IHC	Intelligence Information Handling Committee
IHE	Insensitive High Explosive
IHFR	Improved High Frequency Radio
IHO	(1) International Hydrographic Organization; (2) In Honor of
IHR	In-Extremis Hostage Rescue
II	(1) Imagery Interpretation; (2) Imagery Interpreter
IIC	Imagery Interpretation Center
IICT	Interagency Intelligence Committee on Terrorism
IID	Integrated Information Display
IIDP	Integrated Intelligence Development Plan (USCINCEUR)
IIE	Installation Identification Element
IIF	Imagery Interpretation Facility
IIG	(1) Imagery Intelligence Group (formerly USAIIC); (2) Intelligence Inspector General
IIM	Interagency Intelligence Memorandum
IIN	Imagery Interpretation Note
IINCOMNET	Intratheater Intelligence Community Network
IINS	Imagery Information Need Statement
IIPL	Integrated Intelligence Priority List
IIR	(1) Imaging Infrared; (2) Intelligence Information Report; (3) Imagery Interpretation Report
IIRES	Imagery Interpretation, Reporting, and Exploitation System
IIRK	Interarea Interswitch Rekeying Key
IIRS	Imagery Interpretability Rating Scale
IIS	(1) Indirect Identification System; (2) IPAC Intelligence Summary; (3) Imagery Interpretation Segment
IISE	Intelligence Information System Enhancement
IISS	Intelligence Information Subsystem
IITLPC	Inter/Intra Team Low Power Communications
IITS	(1) Intra-Theater Imagery Transmission System; (2) Installation Information Transfer Systems
IIU	(1) Imagery Interpretation Unit; (2) Imagery Interface Unit
IJMS	Interim JTIDS Message Standard
ILAM	Improved Limpet Assembly Modular
ILC	International Lines of Communication
ILD	Injection Laser Diode
ILE	Intelligence Liaison Element
ILEA	International Law Enforcement Academy
ILO	Intelligence Liaison Officer
ILP	Intelligence Liaison Party
ILS	(1) Instrument Landing System; (2) Integrated Logistic Support
ILSA	Improved Lightweight Satellite Antenna
IM	(1) Information Management; (2) Intermodulation
IM/GD	Intelligence Management/Guidance Document

IMA	(1) Institute for Military Assistance; (2) Intelligence Mobilization Augmentee; (3) Information Mission Area
I-MAE	Interim Medium Altitude Endurance UAV (formerly Tier I)
IMAF	1st Marine Amphibious Force
IMAP	Interim Mission Assessment Program
IMB	(USCENTCOM) Intelligence Management Board
IMC	The International Medical Corps
IMCO	Intergovernmental Maritime Consultative Organization
IMD	Intelligence Management Document
IMEF	First Marine Expeditionary Force
IMET	(1) International Military Education and Training; (2) Integrated Management Evaluation Team
IMETS	Integrated Meteorological System
IMF	International Monetary Fund
IMINT	Imagery Intelligence
IMIS	(1) Intelligence Management Information System; (2) Integrated Management Information System
IMLETT	International Maritime Law Enforcement Training Team
IMMP	Information Management Master Plan
IMNET	Imagery Network
IMOM	Intelligence Many-on-Many
IMOC	International Maritime Officer Course
IMP	(1) Interface Message Processor; (2) Input Message Processor; (3) Image Product; (4) Information Management Program
IMPs	Imagery Products
IMS	International Military Staff (NATO)
IMSAT	Imagery Satellite
IMSE	Imagery Management Support Element
IMSO	International Maritime Satellite Organization
IMTT	Intelligence Mobile Training Team
IN	(1) International Negotiations; (2) Intelligence; (3) Infantry; (4) Director of Intelligence (Air Force Component) (also A2)
INA	Information Not Available
INCA	(1) Intelligence Communications Architecture; (2) Integrated Nuclear Communications Assessment
INCOLLNOM	Intelligence Collection Requirement Nomination
INCOMNET	Intratheater Intelligence Communications Network
INCSEA	Incidents at Sea
INDICOM	(1) Indications Communication Network; (2) Indications and Warning Communications
INDICOMM	Indications Intelligence Communications
INEWS	Integrated Electronic Warfare System
inf	Infantry
INF	Intermediate-Range Nuclear Forces
INFIL	Infiltration
INFLIGHTREP	Inflight Reports
INFLTRPT	Inflight Reports

INFO	Information
INFOSEC	(1) Information Security; (2) Information Systems Security
INGO	International Nongovernmental Organizations
INI	Initiation
INL	International Narcotics and Law
INMARSAT	International Maritime Satellite
INMS	Integrated Network Management System
INR	Bureau of Intelligence and Research (State Department)
INS	(1) Inertial Navigation System; (2) Immigration and Naturalization Service
INSAT	Indian Satellite
INSICOM	Integrated Special Intelligence Communications
INSCOM	U.S. Army Intelligence and Security Command
INST	Instruction
INSTA	Automated Installations File (DIAOLS)
INSTAL	Installation
instl	Installation
INSUM	Intelligence Summary
INT/INTEL	Intelligence
INTACS	(1) Integrated Tactical Communications System; (2) Integrated Tactical Communications Study
INTCP	Intercept
INTEL	Intelligence
INTELCAST	Intelligence Broadcast
INTELCOM	Worldwide Intelligence Communication
INTELDATA	Intelligence Data
INTELINK	Proper Name of System
INTELSAT	International Telecommunications Satellite Organization
Intelink	Command server/client system that allows secure SCI connectivity to all commands on the network, and access to available files without additional log-on.
INTELNET	Intelligence Network
Internet	International Network
INTI	CI database
intg	Interrogation
INTRA	International Travel by Selected Foreign Officials
Intranet	Internet with local scope
INTREP	Intelligence Report
INREQ	Intelligence Request
INTSUM	Intelligence Summary
INUT	Indian Nuclear Underground Test
IO	(1) Indian Ocean; (2) Intelligence Officer; (3) Information Objectives; (4) Intelligence Objective; (5) Intelligence Operations (Division); (6) Information Operations; (7) Information Objectives
I/O	Input/Output
IOA	Indian Ocean Area

IOB	Intelligence Oversight Board
IOC	(1) Initial Operational Capability; (2) Intelligence Operations Center
IOCTL	Indian Ocean Conventional Target List
IOD	Intelligence Operations Division (USEUCOM)
IOF	Intelligence Operations Facility
IOIC	Integrated Operational Intelligence Center
IOM	Input/Output Module
IOMDWG	Interagency Offensive Missile Deployment Working Group
IONDS	Integrated Operational Nuclear Detection System
IOR	Individualized Operational Ration
IONDS	Integrated Operational Nuclear Detection System
IOS	(1) Intelligence Operations Specialist; (2) International Organization for Standards
IOSS	(1) Integrated Operational Support Study; (2) Intelligence Organization Stationing Study
IOT&E	Initial Operational Test and Evaluation
IP	(1) Initial Point; (2) Imagery Processing; (3) Intelligence Problem; (4) Instrumentation Point; (5) Immediate Permanent Incapacitation Dose; (6) Internet Protocol
IP/MP	Inphase/Midphase
IPA	(1) Intelligence Production Activity; (2) Imagery Product Archive
IPAT	Intelligence Planning/Programming Analysis Tool
IPB	Intelligence Preparation of the Battlefield/Battlespace
IPC	(1) Industrial Planning Committee; (2) Intelligence Producers' Council; (3) Intelligence Production Center
IPCP	Intelligence Production Campaign Plan
IPCS	Intelligence Producers Council Staff
IPD	(1) Intelligence Planning Document; (2) Intelligence Plans Division (USEUCOM); (3) Intelligence Production Division
IPDB	Intelligence Production Data Base
IPDS	Imagery Processing and Dissemination System
IPE	Intelligence Production Element
IPF	(1) Integrated Processing Facility; (2) Intelligence Processing Facility (Guardrail)
IPG	Implementation Planning Group
IPIR	(1) Immediate Photo Interpretation Report; (2) Initial Photographic Interpretation Report; (3) Initial Programmed Interpretation Report; (4) Initial Phase Interpretation Report
IPR	Integrated Personal Armor
IPIX	Interface Processor for Imagery Exchange

IPM	(1) Interface Processor for Imagery Exchange; (2) Intelligence Programs Management
IPMA	Intelligence Production Management Activity
IPMO	Intelligence Program Management Office
IPL	Integrated Priority List
IPM	Interpersonal Messaging
IPOIC	Interagency Prisoner of War Ad Hoc Committee
IPOM	Intelligence Program Objective Memorandum
IPP	(1) Intelligence Producer Profile; (2) Impact Point Prediction
IPR	(1) Intelligence Production Requirement; (2) In Process Review; (3) Impulse Response; (4) Internet Protocol Route
IPRG	(1) Intelligence Priorities Review Group; (2) Intelligence Program Review Board
IPS	(1) Integrated Program Summary; (2) Intelligence Production System; (3) Imagery Processing Segment (CARS); (4) Intelligence Production Section; (5) Instructions Per Second; (6) Imagery Processing System
IPSC	Information Processing Standards for Computers
IPSG	Intelligence Program Support Group (now CISA)
IPSO	Internet Protocol Security Option
IPSP	Intelligence Priorities for Strategic Planning
IPT	Integrated Product Team
IPU	Inter-Parliamentary Union
IPW	Interrogation of Prisoners of War
IPWG	Intelligence Priorities Working Group
IPX	Internet Packet Exchange
IR	(1) Infrared; (2) Intelligence Information Report; (3) Illumination Rate; (4) Impulse Response; (5) Information Requirement; (6) Intelligence Requirement; (7) Initial Radiation; (8) Induced Radiation; (9) Information Ratio
I2R	Imaging Infrared
IRA	Intelligence-Related Activities
IRAC	Interdepartmental Radio Advisory Committee
IRBM	Intermediate-Range Ballistic Missile
IRC	(1) International Red Cross; (2) International Rescue Committee
IRCM	Infrared Countermeasures
IRCS	Improved Radar Calibration System
IR&D	Independent Research & Development

IRD	(1) Independent Research & Development; (2) Intelligence Resources Division; (3) Intelligence Reserve Detachment
IRDB	Integrated Requirements Data Base
IRDC	Intelligence Research and Development Council
IRDHS	Imagery-Related Data Handling System (see AIRES)
IREMBASS	Improved Remotely Monitored Battlefield Surveillance System
IRDS	Infrared Detection System
IREMBASS	Improved-Remotely Monitored Battlefield Sensor System
IREPS	Integrated Refractive Effects Prediction System
IRF	(1) Imagery Readiness Facility; (2) Intelligence Readiness Facility
IRG	Interdepartmental Regional Group
IRGM	Infrared Guidance Module
IRINT	Infrared Intelligence
IRIS	Infrared Imaging System
IRISA	Imagery Report Index Summary
IRISF	Intelligence Report Index Summary File
IRK	Interswitch Rekeying Key
IRLS	Infrared Line Scanner
IRM	(1) Intelligence Requirements Management; (2) Information Resource Management
IRMS	Imagery Requirements Management System
IROF	Imagery Reconnaissance Objectives File
IROL	Imagery Reconnaissance Objectives List
IROP	(1) Imagery Reconnaissance Objectives Plan; (2) Infrared Optical Intelligence; (3) Imagery Requirements Objectives Program
IRPG	Installation Reference Points Graphics
IRPIA	Intelligence Information Report Photo Index
IRR	(1) Individual Ready Reserve; (2) Intelligence Requirement Request; (3) Intelligence Readiness Report
IRS	(1) Intelligence Research Specialist; (2) Internal Revenue Service; (3) Interface Requirements Specification; (4) Intelligence Requirements Subcommittee
IRSCOM	Imagery Requirements Subcommittee
IS	(1) Information Systems; (2) Intelligence Specialists; (3) Intelligence Squadron
I&S	(1) Intelligence and Security; (2) Intelligence and Surveillance

ISA	(1) International Security Affairs; (2) Interservice Support Agreement; (3) Intelligence Support Activity; (4) Integration Support Activity; (5) International Support Agreement
ISAF	Israeli Air Force
ISAR	Inverse Synthetic Aperture Radar
ISARC	Intelligence, Surveillance, and Reconnaissance Cell
ISB	(1) Initial Staging Base; (2) Intermediate Staging Base; (3) Intelligence Systems Board; (4) Intelligence Support Base
ISC	(1) Information Systems Command; (2) Information Science Center; (3) Intelligence Support Cell
ISCO	Intelligence Support to Combined Operations
ISC/SC	Intelligence Specialist Chief/Senior Chief
ISD	(1) Intelligence Support Detachment; (2) Intelligence Security Division; (3) Intelligence Support Division
ISDB	Integrated Satellite Data Base
ISDN	(1) Integrated Services Data Network; (2) Intelligence Services Digital Network ISEIntelligence Support Element
ISEMS	Improved Spectrum Efficiency Modeling and Simulation
ISEW	Intelligence, Security, and Electronic Warfare
ISF	Intelligence Support Facility (U.S. Navy)
ISG	Intelligence Support Group (U.S. Navy)
ISHMRS	Improved SOF High Frequency Manpack Radio System
ISIC	Intelligence Support and Indications Center
ISID	Interim Secondary Imagery Dissemination System
ISIDS	Improved SIDS
ISINT	Instrumentation Signals Intelligence
ISIP	Intelligence Support Interface Program
ISIS	(1) Integrated Signals Intelligence System; (2) Interim SOCOM Intelligence Threat Data System
ISLES	Information Systems for Law Enforcement Support
ISM	Industrial Security Manual
ISMB	Intelligence Systems Management Board
ISO	(1) Information Systems Office; (2) International Standards Organization
ISOFAC	Isolation Facility
ISOPREP	Isolated Personnel Report
ISOS	Intelligence System of Systems
ISP	(1) Intelligence Support Plan; (2) Industrial Security Program; (3) Intelligence Support Processor; (4) Integrated Survey Program; (5) Intelligence Survey Program
ISP DCS	Integrated Survey Program Data Collection System
ISP CPE	Integrated Survey Program Central Production Element
ISPER	IPAC Special Reports
ISPO	Intelligence Support Program Office
ISPR	Information Systems Processing Request
ISPS	(1) ISP Server; (2) Improved SOF Power Sources
ISPT	Intelligence Support Processor Tool

ISR	(1) Imagery Support Requirement; (2) Inter-Agency Source Registry; (3) Intelligence, Surveillance and Reconnaissance
ISRD	Information Systems Requirement Document
ISS	(1) Intelligence Support System; (2) Intelligence Support Subsystem; (3) Intelligence Support Staff; (4) Information Security System; (5) Information Systems Security
I&SS	Intelligence and Security Service
ISSA	(1) Information Systems Support Activity; (2) Inter-service Support Agreement
ISSM	Information Systems Security Manager
ISSO	(1) Information Systems Security Officer; (2) Intelligence Systems Support Office
ISST	ICBM SHF Satellite Terminal
IST	(1) Imagery Support Terminal; (2) Intelligence Support Team; (3) Intelligence System Team
ISTA	Intelligence, Surveillance, Target Acquisition
ISWG	Intelligence Support Working Group
ISYSCON	Integrated System Control
IT	Immediate Transient Incapacitation Dose
ITA	(1) Intelligence Terrain Analyzer; (2) International Telegraph Alphabet
ITAAS	Intelligence Training Army Area Schools
ITAC	(1) Intelligence and Threat Analysis Center (U.S. Army); (2) Intelligence Tracking Analysis and Correlation
ITACIES	Interim Tactical Imagery Exploitation System (U.S. Army)
ITACS	Integrated Tactical Air Control System
ITAR	International Traffic in Arms Regulations
ITAS	Improved Target Acquisition System
ITC	Interagency Training Center
ITCT	Improved Tactical Commander's Terminal
ITD	(1) Interim Terrain Data; (2) Individual Training Directorate; (3) International Training Division
ITDB	Intercept Tasking Data Base
ITDN	Integrated Tactical Data Network
ITEP	(1) Interim Tactical ELINT Processor (U.S. Army); (2) Integrated Threat Evaluation Program
ITF	Intelligence Task Force
ITFN	Intra-Task Force Network
ITG	Interdiction Target Graphic
ITIBS	Improved TIBS
ITIC-PAC	INSCOM Theater Intelligence Center-Pacific
ITII	Internal-to-Internal Interface
ITL	Interagency Telephone Laboratory
ITO	(1) International Trade Organization; (2) Integrated Tasking Order
ITOC	Interrogation Translation Operations Center
ITP	(1) Intelligence Town Plan; (2) Interrogation/Translation Platoon
ITS	Imagery Transmission System

ITSS	Integrated Tactical Surveillance System
ITT	Interrogator Translator Team
ITU	(1) Interrogator-Translator Unit; (2) International Telecommunications Union
ITUT	Interim Tactical Users Terminal
ITW	(1) International Targeting Workstation; (2) Integrated Threat Warning
ITW&AA	Integrated Tactical Warning and Attack Assessment
IU	(1) Interface Unit; (2) Image Understanding
lUG	Intelligence Users' Guide
IUS	Inertial Upper Stage
IUSS	Integrated Undersea Surveillance System
IVAN	Intelligence Van
IVCS	Integrated Vehicle Communications System
IVD	Interactive Video Disk
IVIS	Inter-Vehicle Information System
IVSN	Initial Voice Switched Network
IW	(1) Information Warfare; (2) Intelligence Wing
I&W	(1) Indications and Warning; (2) Intelligence & Warning
IWC	Information Warfare Center
IWD	Intermediate Water Depth
IWG	Intelligence Working Group
IWO	Intelligence Watch Officer
IWS	(1) Intelligence Work Station; (2) Information Warfare Squadron
IWSDB	Integrated Weapon System Data Base
IWST	Information Warfare Support Team
IWT	Intelligence Watch Team
IWTS	Indications and Warning Training System
IWW	Inland Waterway
IX	Unclassified Miscellaneous Ship

J

J3	Director(ate) of Operations
J4	Logistics Directorate
J5	Director(ate) of Plans, Policy, and Programs
J6	(1) Director(ate) of Command, Control, Communications; (2) Director(ate) of Command, Control, Communications, and Computer Systems
J7	Joint Operational Plans Staff
J8	Director(ate) of Resource Management
JA	Judge Advocate (General)
JAADS	Joint Allied Air Defense System
JAAT	Joint Air Attack Team
JAC	Joint Analysis Center
JACC/CP	Joint Airborne Communications Center/Command Post
JAD	Joint Assessment Data
JAEIC	Joint Atomic Energy Intelligence Committee
JAG	Judge Advocate General
JAI	Joint Administrative Instruction
JAIEG	Joint Atomic Information Exchange Group
JAIS	Japan Air Intelligence System
JAIS-PAC	Joint Area Information system-USPACOM
JAMIP	Joint Analytic Model Improvement Program
JAN	Joint Army-Navy
JANAF	Joint Army, Navy, Air Force Publication
JANAP	Joint Army/Navy Publication
JAO	Joint Area of Operations
JAOC	Joint Air Operations Center
JAOP	Joint Air Operations Plan
JAPC	Joint Attrition and Penetration Committee
JAR	JIC Analysis Report
JARCC	Joint Air Reconnaissance Control Center
JARIC	(1) Joint Aerial Reconnaissance Intelligence Center; (2) Joint Air Reconnaissance Interpretation Center (UK)
JAROC	(B) Joint Allied Refugee Operations Center (Berlin)
JARP	Joint Aerospace Reserve Program
JASDF	Japanese Air Self-Defense Forces
JASORS	Joint Advanced Special Operations Radio System
JASPO	Joint Airborne SIGINT Program Office
JASS	Joint Airborne SIGINT System
JAST	Joint Advanced Strike Technology Program
JATCCCS	Joint Advanced Tactical C3 System
JAWS	(1) Joint Analytical Workstation; (2) Joint Advanced Weapons System; (3) JDISS-Army Workstation
JBS	(1) Joint Base Station; (2) Joint Broadcast Service
J2C	CIA Liaison

JC2WC	Joint C2 Warfare Center
JCAT	(1) Joint Crisis Action Team; (2) Joint Crisis Analysis Tool
JCC	Joint Coordination Center
JCCC	Joint Communications Control Center
JCCOC	Joint Communications & Control Operational Concept
JCCWC	Joint Command and Control Warfare Center
JCET	Joint/Combined Exercises for Training
JCEOI	Joint CEOI
JCF	Joint Communications Facility
JCISB	Joint Counterintelligence Support Branch
JCISOC	Joint CI Staff Officer's Course
JCMC	(1) Joint Crisis Management Capability; (2) Joint Crisis Management Center
JCMEC	Joint Captured Materiel Exploitation Center
JCMO	Joint Collection Management Office
JCMOTF	Joint Civil Military Operations Task Force
JCMPO	Joint Cruise Missile Project Office
JCMST	Joint Collection Management Support Tool (renamed JCMT)
JCMT	Joint Collection Management Tool
JCNJSIC	Center Cheyenne Mountain Air Force Base (CMAFB) Node
JCNICC	Joint Counternarcotics Intelligence Coordination Center
JCP	Joint Congressional Committee on Printing
JCPES	Joint Chiefs Planning and Execution System
JCPX	Joint Command Post Exercise
JCRC	Joint Casualty Resolution Center
JCS	Joint Chiefs of Staff
JCSAN	JCS Alert Network
JCSAR	Joint Combat Search and Rescue
JCSE	(1) Joint Communications Support Element; (2) Joint Contingency Support Element
JCSM	Joint Chiefs of Staff Memorandum
JCSS	(1) Japan Combat Support System; (2) Joint Communications Support Squadron
JCTG-ME	Joint Technical Coordinating Group for Munitions Effectiveness
J2D	DIA Liaison
JDA	(1) Joint Deployment Agency; (2) Japan Defense Agency; (3) Joint Duty Assignment
JDAC	Joint District Area Command
JDAL	Joint Duty Assignment List
JDAM	Joint Direct Attack Munition
JDC	Joint Debriefing Center
J-DEC	JICPAC-Detachment Japan
JDEC	Joint Document Exploitation Center
JDF	Joint Development Facility
JDGW	Joint Digital Geopositioning Workstation
JDIA	Joint Digital Intelligence Assessment

JDIPC	Joint Deployable Imagery Production Center
JDISS	(1) Joint Deployable Intelligence Support System; (2) Joint Defense Intelligence Support Services
JDISS-C	Joint Deployable Intelligence Support System-CENTCOM
JDISS-E	JDISS-EUCOM
JDISS-S	Joint Deployable Intelligence Support System-SOCOM or SOCRATES
JDIVS	Joint Deployable Intelligence Video/Data System
JDMAG	Joint Deployable Maintenance Analysis Group
JDS	Joint Deployment System
JDSS	Joint Decision Support System
JDSIR	Joint Deployment System Incident Reporting System
JDSSC	Joint Data System Support Center
JEAP	(1) Joint Electronic Analysis Program; (2) Joint Electronic Analysis Position
JEC	Joint Economic Committee
JECC(G)	Joint Exercise Control Center (Group)
JECG	Joint Exercise Control Group
JECM	Joint Electronic Countermeasures
JEEP	Joint Emergency Evacuation Plan
JEIO	Joint Engineering and Interoperability Organization
JEFPROS	JAC EUCOM Force Protection Summary
JEIR	JAC EUCOM Intelligence Review
JEL	Joint Electronic Library
JEM	Joint Exercise Manual
JES	JDISS Embedded Support
JESS	Joint Exercise Support System
JET	JWICS Earth Terminal
JETDS	Joint Electronics Designation System
JEWC	Joint Electronic Warfare Center
JFACC	Joint Force Air Component Commander
JFC	(1) Joint Fusion Center; (2) Joint Force Commander
JFFC	Joint Force Fires Coordinator
JFFSC	Joint Force Fire Support Coordinator
JFI	Joint Force Integrator
JFIC	Joint Force Interdiction Coordinator
JFITL	Joint Force Integrator Task List
JFK CTRMA	John F. Kennedy Center for Military Assistance
JFLCC	Joint Force Land Component Commander
JLOTS	Joint Logistics Over the Shore
JFM	Joint Force Memorandum
JFMCC	Joint Force Maritime Component Commander
JFMO	Joint Frequency Management Office
JFSOCC	Joint Force Special Operations Component Commander
JGITSS	Joint General Intelligence Training System Subarchitecture

JGSDF	Japanese Ground Self-Defense Forces
JIATF	Joint InterAgency Task Force
JIATF-E	Joint InterAgency Task Force - East
JIATF-W	Joint InterAgency Task Force - West
JIB	Joint Intelligence Bureau (Commonwealth Countries)

JTR	Joint Travel Regulation
JTRU	Joint Transportation Reserve Unit
JTSC	Joint Technology Steering Committee
JTSG	Joint Targets Steering Group
JTT	Joint Tactics Terminal
JTTP	Joint Tactics, Techniques and Procedures
JTWS	Joint Threat Warning System
JTX	Joint Training Exercise
JUAVTC	Joint UAV Training Center
JUDI	Joint Universal Data Interpreter
JULL	Joint Universal Lessons Learned
JULLS	Joint Universal Lessons Learned System
JUMPS	Joint Uniform Military Pay System
JUSMAG	Joint United States Military Advisory Group
JUWC	Joint Unconventional Warfare Command
JUWTF	Joint Unconventional Warfare Task Force
JVIDS	Joint Visual Integrated Display System
JWAC	Joint Warfare Analysis Center
JWARS	Joint Warfare Simulation
JWBCA	Joint Whole Blood Control Agency

JWC	(1) Joint Warfare Center; (2) Joint Working Group
JWCA	Joint Warfighting Capability Assessment
JWFC	Joint Warfighting Center
JWG	Joint Working Group
JWICS	(1) Joint Warning Indications Communications System; (2) Joint Worldwide Intelligence Communications System
JWID	Joint Worldwide Interoperability Demonstration
J2X	JTF J2 Support Element

K

K	Kelvin (absolute temperature scale)
KAC	Korea Analysis Center
KADIZ	Korean Air Defense Identification Zone
KAIS	Korean Air Intelligence System
KAK	Key-Auto-Key
KAL	Key Asset List
KALCC	Korean Airlift Control Center
KAPP	Key Asset Protection Program
KAWS	Korean Analyst Workstation
KB	(1) Kilobyte; (2) Knowledgeability Brief
Kbps	Kilobits Per Second (also KPS)
KBS	Knowledge-Based System
KBYTES	Kilobytes
KCG	Korean Consultative Group
KCIA	Korean Central Intelligence Agency
KCOIC	Korean Combat/Combined Operations Intelligence Center
KCSS	Korean Combat Support System
KDC	Key Distribution Center
KDEI	Key Defense Estimates Issues
KDIA	Korean Defense Intelligence Agency
KDII	Key Defense Intelligence Issues
KE	Kinetic Energy
KEK	Key Encryption Key
KELP	Kaleidoscope Elint Processor
KEW	Kinetic Energy Weapon
KG	(1) Kilogram; (2) Key Generator
KGB	Committee for State Security (FSU)
KH	Keyhole
KHA	Killed by Hostile Action
KHz	Kilohertz
KIA	Killed in Action
KIA-BNR	Killed in Action, Body Not Recovered
KIAS	Knots Indicated Air Speed
KIES	Kodak Imagery Exploitation System
KIEWS	Kodak Imagery Edit Workstation
KILLREP	Kill Report
KILLSUM	Kill Summary
KILOD	Killed in the Line of Duty
KIP	(1) Key Intelligence Position; (2) Key Indigenous Personnel
KIPPL	Key Intelligence Program Priorities List
KISS	Korean Intelligence Support System
KIWS	KISS Intelligence Workstation
KJ	(1) Kilojoules; (2) Key Judgments

KM	Kilometer
KMASE	Key Management Application Service Element
KMC	Key Management Center
KM/HR	Kilometers Per Hour
KMODC	Key Management Ordering and Distribution Center
KMID	Key Management Identification Number
KMP	Key Management Protocol
KMPDU	Key Management Protocol Data Unit
KMR	Kwajalein Missile Range
KMS	Key Management System
KMSA	Key Management System Agent
KMUA	Key Management User Agent
KN	Knot
knots	Nautical Miles per hour
KP	Key Processor
KPH	Kilometers Per Hour
KPK	Key Production Key
KS	South Korea (ROK)
KSA	Knowledge, Skills, and Abilities
KSC	Kennedy Space Center
KSOS	Kernelized Secure Operating System
KT	(1) Kiloton; (2) Knot
KTAS	Knots True Airspeed
KTO	Kuwait Theater of Operations
KTTP	Korean Tactics, Techniques, and Procedures
Ku	A Satellite Frequency Band
KUSLO	U.S. Liaison Office-Kenya
KW	Kilowatt
KWH	Kilowatt Hours
KVG	Key Variable Generator

L

LAAIB	Latin American Air Intelligence Brief
LAAM	Light Anti-Aircraft Missile
LAB	Laboratory
LABS	Laboratories
LAD	Launch Assist Device
LADD	Low Angle Drogue Delivery
LAEO	Low-Altitude Electro-Optical
LAEWWING	Light-Airborne Early Warning Wing
LAF	Launch Alert Folder
LAFTA	Latin America Free Trade Association
LAGEOS	Laser Geodynamic Satellite
LAI	(1) Light Armored Infantry; (2) Look-Down Air Intercept
LAL	Library Accessions List
LALO	Low-Altitude Low-Opening
LAM	Louisiana Maneuvers
LAMM	Land Armament and Manpower Model
LAMP	Lockwood Analytical Method for Prediction LAMPS (1) Light Airborne Multipurpose System; (2) LANTCOM Message Processing System
LAN	Local Area Network
LANDCENT	Land Forces Central Region
LANDSAT	Land Satellite (Commercial Multi-Spectral)
LANDSOUTH	Land Forces Southern Region
LANFORSIXTHFLT	Landing Force Sixth Fleet
LANL	Los Alamos National Laboratory
LANT	Atlantic
LANTAF	Atlantic Command Air Forces
LANTAREA	Atlantic Area
LANTCOM	Atlantic Command (now ACOM)
LANTCOMDIS	Atlantic Command Deployable Intelligence System
LANTCOM JIC	Atlantic Command Joint Intelligence Center (AIC)
LANTDAC	Atlantic Command Defense Analysis Center
LANTDIS	USACOM Deployable Intelligence System
LANTFLT	U.S. Atlantic Fleet
LANTIRN	Low-Altitude Navigation and Targeting Infrared System for Night
LANTIS	Atlantic Intelligence Supplement
LANUP	Local Area Network Upgrades
LANWAN	Local Area Network/Wide Area Network
LAR	Laser-Aided Rocket

LARB	Light Amphibious Reconnaissance Battalion
LARS	Light Artillery Rocket System
LAS	Land Analysis System
LASA	Light Armed Surveillance Attack
LASER	Light Amplification by Stimulated Emission of Radiation
LASERFAX	Secure System for Transmitting Photos
LASH	Lighter Aboard Ship
LASINT	Laser Intelligence
LASTE	Low-Altitude Safety Targeting Enhancement
LAT	Latitude
LATAM	Latin America
LATIN	Atlantic Command Theater Intelligence Network
LATS	Large Aperture Tracking System
LATWING	Light Attack Wing
LAV	Light Armored Vehicle (non-tactical)
LAW	Light Antitank Weapon
LAWS	Long-Range Cruise Missile Analysis and Warning System
LB	Live Broadcast
Lb	Pound
L-BAND	1 to 2 GHz
LBR	Laser Beam Recorder
lbs (LB)	Pounds
LBSR	Lightweight Battlefield Surveillance Radar
LC	(1) Library of Congress; (2) Line of Contact
LCAC	Landing Craft, Air Cushion
LCC	(1) Amphibious Command Ship; (2) Logistics Coordination Center; (3) Launch Control Center; (4) Land Component Commander
LCC-IC	Amphibious Command Ship-Intelligence Center
LCD	Liquid Crystal Display
LCE	Liaison Coordination Element (Special Operations Liaison Team in Coalition Operations)
LCF	Launch Control Facility
LCM	(1) Medium Landing Craft; (2) Life Cycle Management
LCP	(1) Personnel Landing Craft; (2) Launching Control Post
LCPR	Ramped Personnel Landing Craft
LCS	Low-Cost Satellite
LCSMM	Life Cycle Support Management Model
LCSR	Swimmer Reconnaissance Landing Craft
LCU	(1) Utility Landing Craft; (2) Launch Correlation Unit
LCW	Special Warfare Support Craft
LCWS	Low-Cost Workstation
LD	(1) Line of Departure; (2) Laser Defense
LDC	(1) Less-Developed Country; (2) Local Data Concentrator; (3) Light-Weight Deployable Communication; (4) Land Defense of CONUS

LDEF	Long Duration Exposure Facility
LDF	Lightweight Digital Facsimile
LDIS	Library Document Inventory System
LDM	Limited Distance Modems
LDMX	Local Digital Message Exchange
LDR	Low Data Rate
LDS	Laser Detection System
LDSD	Lookdown/Shootdown
LDT	Large Diameter Target
LDX	Long-Distance XEROX
LEA	Law Enforcement Agency
LEAD	(1) Low-Cost Encryption/Authentication Device; (2) List of Emerging Activations and Dispositions
LEAF	Law Enforcement Access Field
LEASAT	(1) Leased Satellite; (2) Leased System
LED	Light Emitting Diode
LEDS	Link 11 Display System
LEM	Land Engagement Model
LEN	Large Extension Node
LENSCE	Limited Enemy Situation Correlation Element
LEP	Linear Error Probable
LEPCU	Lightweight Environmental Protection Combat Uniform
LEO	Low Earth Orbit
LEO COM	Low Earth Orbit Data Communications
LERTCON	Alert Condition
LES	(1) Leading Edge Services; (2) Land Earth Station; (3) Limited Effects Submunition
LEW	Limited Effects Weapons
LEXIS	Meade Data Central Legal Service
LF	(1) Low Frequency; (2) Launch Facility; (3) Landing Force
LF6F	Landing Force 6th Feet
LFC	Large Format Camera
LFICS	Landing Force Integrated Communications System
LFM	Landing Force Manual
LFOC	Landing Force Operations Center
LFOV	Limited Field of View
LFR	Inshore Fire Support Ship
LFRSV	Launch-Fly-Recover Space Vehicle
LFS	Amphibious Warfare Fire Support Ship
LG	ACC Director of Logistics
LGB	Laser-Guided Bomb
LHA	Amphibious Assault Ship (General Purpose)
LHA-IC	Amphibious Assault Ship (General Purpose)-Intelligence Center
LHD	Multi-Purpose Amphibious Assault Ship
L-HOUR	Hour on C-Day when deployment begins

LHR	Low Hop Rate
LHW	Lower High Water
LHX	Lightweight Helicopter
LIC	Low-Intensity Conflict
LIDAR	Light Detection and Ranging
LIGHTSAT	Lightweight Satellite
LIMDIS	(1) Limited Dissemination; (2) Limited Distribution
LIME	Laser-Induced Magnetic Emissions
LIMMER	Limited Control of Merchant Shipping
LIN	LANTCOM Intelligence Network
LINCS	Long-Range Intelligence Networked Communications Service
LIR	Launch and Impact Report
LISS	LANTCOM Intelligence Support System
LITE	Laptop Imagery Transmission Equipment
LITES	Laser Intercept and Technical Exploitation System
LITINT	Literature Intelligence
LIVID	Language Identification and Voice Identification
LIWA	Land Information Warfare Activity
LJ	Laser Jet
LKA	Amphibious Cargo Ship
LKG	Loop Key Generator
LL	(1) Landline; (2) Latent Lethal Dose
LLLTV/IR	Low-Light-Level TV/Infrared
LLSO	Low-Level Source Operations (CI/HUMINT)
LLTV	Low-Light-Level Television
LLNL	Lawrence Livermore National Laboratory
LLO	Land Liaison Office
LLW	Lower Low Water
LLVI	Low-Level Voice Intercept
LMBB	GENSER Intelligence Broadcast
LMCC	LOCE Mobile Correlation Center
LMD	Local Management Device
LMD-KP	Local Management Device/Key Processor
LME	Layer Management Entry
LMI	Layer Management Interface
LMR	Land Mobile Radio
LMRDFS	Lightweight Man-Transportable Radio Direction Finding System
LMS	(1) Local Monitor Station; (2) Least Means Squared
LMSR	Large Medium Speed RO/RO
LNA	Low Noise Amplifier
LNE	Liaison Element
LNG	Liquefied Natural Gas
LNIS	Atlantic Command Naval Intelligence Summary
LNO	(1) Limited Nuclear Option; (2) Liaison Officer

LNU	Last Name Unknown
LO	(1) Liaison Officer; (2) Low Observables
LO/LO	Lift-On/Lift-Off
LOA	(1) Letter of Agreement; (2) Lead Operational Authority; (3) Letter of Assist
LOAC	Law of Armed Conflict
LOB	Line of Bearing
LOC(S)	(1) Line(s) of Communication; (2) Library of Congress; (3) Launch Operations Center; (4) Liaison Officer Coordinator; (5) Location; (6) ILS Localizer
LOCD	Lines of Communication Designators
LOCE	(1) Limited Operational Capability, Europe; (2) Linked Operations-Intelligence Centers Europe
LOCK	Logical Co-Processing Kernel
LOD	Low-Observable Demonstrations
LOFAR	Low-Frequency Analysis and Recording
LOG	Logistics
LOGCAP	Logistics Civil Augmentation Program
LOGEX	Logistics Exercise
LOGS	Logistics
LOI	(1) Letter of Instruction; (2) Location of Interest
LON	Longitude
LONG	Longitude
LORAD	Long-Range Air Defense
LORAN	Long-Range Navigation
LOROP	Long-Range Oblique Photography
LOROPS	(1) Long-Range Optical System; (2) Long-Range Oblique Photographic Sensor
LOS	(1) Line of Sight; (2) Law of the Sea
LOTS	(1) Lighter Over the Shore; (2) Logistics Over the Shore
LOW	(1) Laws of War; (2) Launch on Warning
LOX	Liquid Oxygen
LP	Listening Post
LPA	Amphibious Personnel Transport
LPAR	Large Phased-Array Radar
LPC	Linear Predictive Coding
LPD	(1) Amphibious Assault Transport Dock; (2) Low Probability of Detection
LPD/I	Low Probability of Detection/Intercept
LPF	Low Pass Filter
LPG	Liquefied Natural Gas
LPH	Amphibious Assault Ship (Helicopter)
LPI	(1) Low Probability Intercept; (2) Lines per Inch
LPO	Leading Petty Officer
LPR	Amphibious Transport (Small)
LPS	(1) Logistics Planning Study; (2) Large Processing Station

LPSS	Amphibious Transport Submarine
LPT	Logistics Preparation of the Theater
LRA	Long-Range Aviation (FSU)
LRAA	Long-Range Air Army (FSU)
LRAACA	Long-Range Air-ASW Capable Aircraft
LRAAM	Long-Range Air-to-Air Missile
LRC	(1) Logistics Readiness Center; (2) Logistics Resupply Center; (3) Lesser Regional Contingency; (4) Limited Regional Conflict; (5) Limited Regional Contingency
LRCM	Long-Range Cruise Missile
LRCS	Light-Reaction Communications System
LRE	Launch and Recovery Element
LREO	Long Range Electro-Optical
LRINF	Longer Range Intermediate-Range Nuclear Forces
LRIP	Limited/Low-Rate Initial Production
LRL	Low-Cost Receive Location
LRM	Low-Rate Multiplexer
LRP	(1) Low-Rate Production; (2) Long-Range Plan; (3) Limited Response Package
LRR	Long-Range Reconnaissance
LRRP	Long-Range Reconnaissance Patrol
LRSC	Long-Range Surveillance Company
LRSO	Long-Range Surveillance Out-Post
LRSP	(1) Long-Range Surveillance Plan; (2) Long-Range Systems Plan
LRSPRAC	Long-Range Special Reporting and Coordination
LRSTIA	Long-Range Scientific and Technical Intelligence Assessment
LRSU	Long-Range Surveillance Unit
LRTNF	Long-Range Theater Nuclear Forces
LRU	Line-Replaceable Unit
LSA	(1) Logistics Support Analysis; (2) LAN Systems Administrator
LSB	Lower Sideband
LSC	Linear Shaped Charge
LSCS	Logistics Support Command, Somalia
LSD	(1) Landing Ship, Dock; (2) Lease Separation Distance
LSDV	Swimmer Delivery Vehicle
LSE	Logistic Support Element
LSG	Large-Scale Graphics
LSI	Large-Scale Integration
LSM	Medium Amphibious Assault Landing Ship
LSP	Launch Sequence Plan
LSS	Library Support System
LSSA	Logistic System Support Activity
LSSC	Light Seal Support Craft
LST	(1) Amphibious Vehicle Landing Ship; (2) Local Standard Time
LST-5C	Deployable Satellite Terminal

LSV	Light Strike Vehicle
LT	(1) Light Table (2) Light
LTAC	Land Terminal Access Control
LTAS	Lightweight Tactical Army Satellite Communications System
LTBT	Limited Test Ban Treaty
Ltd	Limited
LTDP	NATO Long-Term Defense Program
LTDS	Laser Target Designator System
LTI	Lightweight Thermal Imager
LTID	Laser Target Interface Device
LTIOV	Latest Time Information of Value
LTMS	Light Table Mensuration System
LTOE	Living Table of Organization and Equipment
LUA	Launch Under Attack
LUT	Limited User Test
LVDS	Low-Volume Dissemination System
LW	Low Water
LWA	Light Weight Aircraft
LWIR	Long-Wavelength Infrared
LWM	Lightweight Motor
LWOP	Leave Without Pay
LWR	Lutheran World Relief, Inc
LWT	Amphibious Warping Tug
LZ	Landing Zone
LZCT	Landing Zone Control Team

M

3M	Material, Maintenance, Management
M	(1) Meter; (2) Mach; (3) Mega (Million)
M1A1	M1A1 ABRAMS Tank
MA	Mission Assessment
MAA	Mission Area Analysis
MAAG	Military Assistance Advisory Group
MAAP	Master Air Attack Plan
MAB	Marine Amphibious Brigade
MAC	(1) Military Airlift Command (now AMC); (2) Mobile Inshore Undersea Warfare Attack Craft; (3) Multi-Array Correlator; (4) Missile Analysis Center; (5) Mandatory Access Control; (6) Message Authentication Code; (7) Military Areas of Coordination
MAC-IN	Military Airlift Command-Director of Intelligence
MACA	Military Assistance to Civil Authorities
MACCOM	MAC Communications (Network)
MACCS	Marine Aviation Command and Control System
MACDIS	Military Assistance to Civil Disturbances
MACLO	MAC Liaison Officer
MACOM	(1) Major Army Command; (2) Major Command
MACSAT	Multiple Access Communications Satellite
MAD	(1) Magnetic Anomaly Detector; (2) Mutual Assured Destruction
MADP	Military Attache for Defense Programs
MAE	(1) Mean Area of Effectiveness; (2) Medium Altitude Endurance UAV (formerly Tier II)
MAEO	Medium-Altitude Electro-Optical
MAE-UAV	Medium-Altitude Endurance Unmanned Aerial Vehicle
MAF	Marine Amphibious Force
MAFC	MAGTF All-Source Fusion Center
MAG	(1) Marine Aircraft Group; (2) Military Assistance Group; (3) Military Advisory Group; (4) Magnetic
MAGIC	Maritime Air-Ground Intelligence Cell
MAGIIC	Mobile Army Ground Imagery Interpretation Center
MAGIS	Marine Air-Ground Intelligence System
MAGR	Miniature Airborne GPS Receiver
MAG Tape	Magnetic Tape
MAGTF	(1) Marine Air-Ground Task Force; (2) Marine Amphibious Ground Task Force
MAINT	Maintenance
MAIS	Military Airlift Intelligence System
MAISRC	Major Automated Information System Review Council
MAJCOM	(1) Major Air Force Command; (2) Major Command
MAMS	MASINT Automated Management System
MAN	(1) Mandatory Modification; (2) Metropolitan Area Network

MANPADS	Manportable Air Defense System
MANPRINT	Manpower and Personnel Integration
MAO	Major Attack Option
MAOC	Modular Air Operations Center
MAP	(1) Military Assistance Program; (2) Ministry of Aviation Industry (USSR); (3) Multiple Aim Point; (4) Master Attack Plan; (5) Materiel Acquisition Process
MAPREQ	Map Requisition System
MARAD	Maritime Administration
MARC	MAC ALCE Reaction Communications System
MARCENT	Marine Forces Central Command
MARCORSYSCOM	Marine Corps Systems Command
MARE	Mission Analysis Report-Electrical
MARECS	Maritime European Communications Satellite
MARDEZ	Maritime Defense Zone
MARDEZLANT	Maritime Defense Zone, Altantic
MARDIV	Marine Division
MARFOR	Marine Forces
MARFOREUR	Marine Forces Europe
MARFOR-K	Marine Forces Korea
MARFORCENT	Marine Forces, Central Command
MARFORLANT	Marine Forces Atlantic
MARFORPAC	Marine Forces Pacific
MARFORSOUTH	Marine Forces, Southern Command
MARG	(1) Marine Amphibious Readiness Group; (2) Marginal
MARINETERP	Westlant Maritime Intelligence Report
MARINTSUM	Maritime Intelligence Summary
MARISAT	Maritime Satellite (COMSAT)
Mark-Up	Detailed Budget Recommendation from a Congressional Committee
MARPAC	Marine Forces Pacific
MARREP	Maritime Report
MARS	(1) Man-hour Accounting and Reporting System; (2) Military Affiliate Radio System; (3) Monthly Aerial Reconnaissance Summary
MART	Mobile Autodin Record/Remote Terminal
MARV	Maneuverable Reentry Vehicle
MAS	(1) Military Airlift Squadron; (2) Measurement and Signature; (3) Message Analysis Server; (4) Military Agency for Standardization
MASDR	Measurement and Signature Data Requirements
MASH	Mobile Army Surgical Hospital
MASINT	Measurement and Signature Intelligence
MASS	(1) Matrix Analysis Subsystem; (2) Missile and Space Summary
MASST	Major Ship Satellite Terminal
MAST	(1) Mobile Ashore Support Terminal; (2) Manual Acquisition Satellite Track; (4) MILSTAR Advanced Satellite Terminals

MAT	Medium Assault Transport
MATB	Multi-Spectral Analyst Test Bed
MATC	Armored Troop Carrier, Mini
MATDEV	Materiel Developer
MATRIX	Multi-source Automatic Target Recognition with Interactive Exploitation
MATS	Mobile Automatic Telephone System
MATSYM	Material Symbol
MATT	Multi-Mission Advanced Tactical Terminal
MATWING	Medium Attack Wing
MAU	Marine Amphibious Unit
MAVUS	Maritime Vertical Takeoff and Landing Unmanned Aerial Vehicle System
MAW	(1) Military Airlift Wing; (2) Marine Aircraft Wing
MAWTS	Marine Aviation Weapons and Tactics Squadron
MAXI	Modular Architecture for the Exchange of Intelligence
MB	(1) Megabit; (2) Meteor Burst; (3) Megabits
Mb	Megabyte
MBA	(1) Main Battle Area; (2) Multiple Beam Antennae
MBB	Modular Building Block (of EIF/ECMC)
MBC	Meteor Burst Communications
MBFR	Mutual and Balanced Force Reduction
MBITR	Multiband Inter Team Radio
MBO	Management by Objective
MBMR	Multiband Multimode Radio
MBPS	Megabytes per Second
MBRADIO	Multiband Radio
MBT	Main Battle Tank
MBYTES/Mbyte	Megabytes
MC	(1) Military Committee; (2) Mobility Corridor; (3) Joint Military Intelligence College; (4) Multi-Channel MC&G Mapping, Charting and Geodesy
MCA	(1) Maritime Collection Assets; (2) Military Capabilities Assessment; (3) Military Civil Action; (4) Mission Concept Approval
MCAR	Multi-Channel Acoustic Relay
MCAS	Marine Corps Air Station
MC ASI	Marine Corps Assistant Chief of Staff Intelligence
MCB	(1) Markings Center Brief; (2) Marine Corps Base
MCC	(1) Mobile Command Center; (2) Movement Control Center; (3) Mission Control Complex; (4) Military Coordination Center; (5) Mission Control Cell; (6) Mission Control Center
MCCB	Modification/Configuration Control Board
MCCC	Mobile Consolidated Command Center (USSPACECOM)
MCCP	Marine Corps Campaign Plan
MCCS	Mobile Command and Control System
MCCT	Mobile Command Communications Team
MCDN	Marine Corps Data Network

MCDS	Multilateral Counterterrorism Data System
MCE	(1) Mission Control Element; (2) Modular Control Equipment
MCEB	Military Communications Electronics Board
MCG	(1) Magneto Cumulative Generator; (2) Minimum Character Grid; (3) Monitor Control Group; (3) Mapping, Charting, and Geodesy
MCG&I	Mapping, Charting, Geodesy, and Imagery
MCIA	Marine Corps Intelligence Activity
MCM	(1) Mine Countermeasures; (2) Military Committee Memorandum; (3) Multi-Command Manual; (4) Chairman of the Joint Chiefs of Staff Memorandum (Designator)
MCMIP	Marine Corps Master Intelligence Plan
MCO	MASINT Control Officer
MCOO	Modified Combined Obstacles Overlay
MCP	Mobile Command Post
MCR	Military Command Region
MCRB	Military Costing Review Board
MCRC	Master Control and Reporting Center
MCRD	Marine Corps Recruit Depot
MCRP	Mobilization Command Readiness Program
MCS	(1) Mine Countermeasures Support Ship; (2) Military Capabilities Study; (3) Maneuver Control System; (4) Master Control Station; (5) Mission Control Segment
MCSF	Mobile Cryptologic Support Facility
MCSFBN	Marine Corps Security Force Battalion
MCSP	Mobile Communications Support Package
MCST	Magnetic Card Selectric Typewriter (IBM)
MCT	Mobile Communications Terminal
MCTL	(1) Mediterranean Contingency Target List; (2) Military Critical Technologies List
MCU	Mobile Communications/Command Unit
MCW	Modulated Continuous Wave
MD	(1) Military District; (2) Map Distance; (3) Mission Director
MDA	Missile Defense Act of 1991
MDAP	Major Defense Acquisition Program
MDC	(1) Manipulation Detection Code; (2) Message Distribution Center
M-Day	Day on which mobilization begins
MDI	Multidiscipline Interaction
MDCI	Multidisciplinary Counterintelligence
MDCISUM	Multidisciplinary Counterintelligence Summary
MDDS	Modular Digital Dissemination System
MDID	MSE Data Interface Device
M-DITDS	Migration Defense Intel Threat Data System
MDJCS	Memorandum by the Director, Joint Staff for the Joint Chiefs of Staff
MDLX	Military Demarcation Line Extended

MDPS	Mission Data Preparation System
MDO JAPAN	Military Defense Office, Japan
MDR	(1) MASINT Data Request; (2) Medium Data Rate
MDS	(1) Mission Dependent Segment; (2) Modular Dissemination System
MDT	Message Distribution Terminal
MDU	(1) Mine Disposal Unit; (2) Mission Data Update
MDW	Military District of Washington
MDZ	Maritime Defense Zone
ME	(1) Middle East; (2) Munitions Effectiveness
MEA	Munitions Effectiveness Assessment
MEAP	Military Economic Advisory Panel
MEB	Marine Expeditionary Brigade
MEBE	Middle East Basic Encyclopedia
MEC	Main Evaluation Center
MECD	Military Equipment Characteristics Document (NATO)
MECH	Mechanized
MECL	Mission Essential Circuits List
MECO	Main Engine Cutoff (Shuttle and Expendable Launch Vehicles)
MECS	Manual ELINT Collection System
Med	Mediterranean
MED	(1) Message Element Dictionary (JINTACCS); (2) Manipulative Electronic Deception; (3) Medical
MED-RES	Medium Resolution
MEDCAP	Medical Civic Action Project
MEDCOM	Medical Command
MEDEVAC	Medical Evacuation
MEDRETE	Medical Readiness Training Exercises
MEDINT	Medical Intelligence
MEECN	Minimum Essential Emergency Communications Network
MEF	(1) Marine Expeditionary Force; (2) Maximum Elevation Figure
MEFCG	MEF Command Group
MEFTL	Middle East Force Target List
MEIF	Master ELINT Intercept File
MECL	Mission Essential Circuits List
MELOS	Mediterranean Littoral OPINTEL Summary
MELT	Maximum Efficiency Language Training
MEM	Mission Effectiveness Model
MENA	Middle East (and) North Africa
MENS	Mission Element Needs Statement
MEO	Medium Earth Orbit
MEP	(1) Ministry of Electronics Industry (FSU); (2) Mission Enhancement Program (AWACS); (3) Management Engineering Plan
MER	(1) Maximum Effective Range; (2) Minimum Essential Requirements

MERADCOM	Mobility Equipment Research and Development Command (U.S. Army)
MERCAST	Merchant Ship Broadcast System
MERCO	Merchant Ship Reporting and Control
MERCOSUR/MERCOSUL	Common Market of the South (South American Southern Cone Customs Union)
MERIT	Military Exploitation of Reconnaissance and Intelligence Technology
MERSHIP	Merchant Ship
MESA	Mechanically Steered Antenna
MET	(1) Mobile Exploitation Team; (2) Meteorology; (3) MILSTAR Engineering Development Model Terminal
METCOM	Control of Meteorological Information
METEOSAT	Meteorological Satellite
METL	Mission Essential Task List
METOC	Meteorological and Oceanographic
METSAT	Meteorology Satellite
METT-T	Mission, Enemy, Terrain, Troops and Time Available
MEU	Marine Expeditionary Unit
MEU(SOC)	Marine Expeditionary Unit (Special Operations Capable)
MEWSS	Mobile Electronic Warfare Support System
MEWSS PIP	Marine Electronic Warfare Support System-Product
MF	Medium Frequency
MFC	Multinational Force Commander
MF IDB	Mainframe Integrated Data Base
MFLOPS	Millions of Floating Point Operations per Second
MFO	Multinational Force and Observers
MFP	Major Force Program
MFP2	Major Force Program 2
MFR	(1) Memorandum for Record; (2) Mutual Force Reduction
MFS	(1) Ministry of State Security (East German); (2) Multifunction Switch
MFT	Mission, Functions and Tasks
MG	Machinegun
MGID	Military Geographic Information and Documentation
MGMT	Management
MGPS	Mobile Ground Processing System
MGR	Manager
MGRS	Military Grid References System
MGS	(1) Mission Ground Station; (2) Mobile Ground Station
MGT	(1) Mobile Ground Terminal; (2) Management
MHC	Coastal Mine Hunter
MHD	Magnet-to-Hydrodynamic
MHE	(1) Mechanized Handling Equipment; (2) Message Handling Enhancement; (3) Materiel Handling Equipment
MHOP	Multiple-Hop
MHS	Message Handling System

MHV	Miniature Homing Vehicle
MHW	Mean High Water
MHz	Megahertz
mi	Miles
MI	(1) Military Intelligence; (2) Message Indicator
MIA	Missing in Action
MIB	(1) Military Intelligence Board; (2) Military Intelligence Battalion; (3) Management Information Base
MIBNLI	Military Intelligence Battalion, Low Intensity
MIBWG	Military Intelligence Board Working Group
MIC	(1) Mid-Intensity Conflict; (2) Multinational Intelligence Cell; (3) Monolithic Integrated Circuit; (4) Maritime Intelligence Center
MICEP	Military Intelligence Civilian Excepted Career Program
MICNS	Modular Integrated Communications and Navigation System
MICOM	Missile Command (U.S. Army)
MICON	Military ICON
micro	one millionth
MICFAC	Mobile Integrated Command Facility Ashore Center
MICS	MIIDS/IDB Interface to Client/Server
MICV	Mechanized Infantry Combat Vehicle
MID	(1) Military Intelligence Detachment (2) Military Intelligence Digest MIDB Modernized Integrated Data Base; Migratory Integrated Data Base
MID(S)	(1) Military Intelligence Detachments (Strategic); (2) Mobile Imagery Dissemination System
MIDAS	MAXI Intelligence Desktop Application Software
MIDE	Mean Installation Damage Expectancy
MIDEASTFOR	Middle East Force
MI DET	Military Intelligence Detachment
MIDL	Miniature Interoperable Data Link
MIDLANT	Mid-Atlantic
MIDPAC	Mid-Pacific
MIDMS	Machine Independent Data Management System
MIEF	Master Imagery Exchange Format
MIERS	Modernized Imagery Exploitation & Reporting System
MIES	Modernized Imagery Exploitation System
MIFASS	Marine Integrated Fire and Air Support System
MIG	(1) Mikoyan (FSU) Aircraft; (2) Military Intelligence Guide; (3) Military Intelligence Group
MIGP	Military Intelligence Group
MIIA	Medical Intelligence Information Agency (now AFMIC)
MIIDS	Military Intelligence Integrated Data System
MIIDS/IDB	Military Intelligence Integrated Data System/Integrated Database
MIIPS	Military Intelligence Information Processor Subsystem
MIJI	Meaconing, Intrusion, Jamming, and Interference

MIJIFEEDER	Meaconing, Intrusion, Jamming, and Interference Report Feeder
MIL	Military
MILAN	International Antitank Guided-Missile System
MILCOM	Military Communications
MILCOMSAT	Military Communications Satellite
MILCON	Military Construction
MILDEP	Military Department
MILGP	Military Group
MILGRPS	Military Advisory Groups
mili	one thousandths
MILNET	(1) Military Logistics Equipment; (2) Military Network
MILOBS	Military Observer(s)
MILPERS	Military Personnel
MILSAT(COM)	Military Satellite (Communications)
MILSPEC	Military Specification
MILSTAR	(1) U.S. Military Communications Satellite Program; (2) Military Strategic and Tactical Relay
MILSTD	Military Standard
MIMES	Multi-Spectral Imagery Materials Exploitation System
MIMI	Multi-Level Interactive Man/Machine Interface
MIMIC	Monolithic Microwave/Millimeter Wave Integrated Circuit
MIMS	Multiple Independent Maneuvering Submissile
min	Minutes
MIN-O	Minimum Weapon for Damage
MINI-DISE	Compact Version of Deployable Intelligence Support Element
MINTERM	Miniature Terminal
MINURSO	United Nations Mission for the Referendum in Western Sahara
MINX	Multi-Media Information Exchange
MIPE	Mobile Intelligence Processing Element
MIO	(1) Missile Intelligence Officer; (2) Counter-Terrorism Database
MIP	(1) Management Implementation Plan; (2) Message Input Processor
MIPE	Mobile Intelligence Processing Element
MIPIR	(1) Multi-Mission Imagery Photographic Interpretation Report; (2) Multi-Source Photo Interpretation Report
MIPR	Military Interdepartmental Purchase Request
MIPS	Million Instructions per Second
MIR	(1) Mission Intercept Report; (2) Morning Intelligence Report
MIRA	Medium-Wave Infrared Acquisition Array
MIRACL	Mid-Infra-Red Advanced Chemical Laser
MIRADCOM	United States Army Missile Research & Development Command
MIRE	Mission Intercept Report-Electrical
MIRF	Mission Information Recording Facility
MIRGS	Multi-Intelligence Reconnaissance Ground Station
MIRS	Miniaturized Imagery Receive System

MIRV	Multiple Independently-Targetable Reentry Vehicle
MIS	(1) Management Information System; (2) Military/Monthly Intelligence Summary; (3) Mission Integration Segment
MISE	Military Information Support Element
MISREP	Mission Report
MISSI	Multilevel Information System Security Initiative
MIST	(1) MCCS Intelligence Support Team; (2) Modular Interoperable Support Terminal; (3) Military Information Support Team
MISTE	Miniature Integrated Satellite Terminal Equipment
MIT	Mobile Interrogation Team (HUMINT)
MITASK	Mission Tasking
MITS	(1) Monthly International Terrorism Summary; (2) MAC Imagery Transmission System; (3) Multimedia-Intelligence Tracking Subsystem
MITT	Mobile Integrated Tactical Terminal
MITTS	Mobile Intelligence Tactical Transmission (System)
MIUW	Mobile Inshore Undersea Warfare
MIW	Mine Warfare
MJCS	Memorandum for the Joint Chiefs of Staff
MK-5O	Advance Lightweight Torpedo
MK V	Mark V Special Operations Craft
MLA	Multispectral Linear Array
MLBM	Modern Large Ballistic Missile
MLE	Mobile Logistics Element
MLLW	Mean Lower Low Water
MLM	Military Liaison Mission
MLNIS	Modified Atlantic Naval Intelligence Summary
MLO	Military Liaison Office
MLP	Multi-Line Phone
MLPP	Multilevel Precedence Preemption
MLRP	Marine Corps Long-Range Plan
MLRS	Multiple Launch Rocket System
MLS	(1) Microwave Landing System; (2) Multi-Level Security; (3) Multi-Level Simulcast
MLSATCOM	Military Satellite Communications
MLST	Mobile Logistics Support Team
MLW	Mean Low Water
MM	(1) Millimeter; (2) Million; (3) Manual Morse; (4) Minelayer
MMB	Miniature Multiband Beacon
MMI	Man/Machine Interface
MMIC	Monolithic Microwave Integrated Circuit
MMIS	Military Man in Space
MMP	MAGTF Master Plan
MMS	Multimission Modular Spacecraft
MMU	Manned Maneuvering Unit

MMW	Millimeter Wave
MN	Multinational
MNAS	MAXI Network Access System
MNC	Major NATO Command (NATO)
MND	Multi-National Division
MNF	Multi-National Force
MNIC	Multinational Intelligence Cell
MNMIC	Modernized NMIC
MNS	Mission Needs Statement
MNTHS	Months
MNU	Middle Name Unknown
MO	Counter-Terrorism Database
MOA	(1) Memorandum of Agreement; (2) Military Operating Area
MOAF	Mission-Oriented Assessment Framework
MOB	(1) Main Operating Base; (2) Missile Order of Battle; (3) Mobilization
MOBDES	Mobilization Designee (now IMA)
MOBEX	Mobilization Exercise
MOBS	Multiple-Orbit Bombardment System
MOBSTA	Mobilization Station
MOBTDA	Mobilization Table of Distribution and Allowances
MOC	(1) Minister of Communications; (2) Mission Operations Center; (3) Mission Operations Chief
MOD	(1) Ministry of Defense; (2) Mobile Obstacle Detachment
MODA	Ministry of Defense and Aviation
MODCOM	Modular Communications
MODEMS	Modulation/Demodulation Equipment
MODS	Multiple Object Data System
MOE	Measure of Effectiveness
MOGAS	Motor Gasoline
MOICPAC	Maritime Operational Intelligence Center, Pacific
MOJT	Managed On-the-Job Training
MOL	Manned Orbital Laboratory
MOLINK	Moscow/Washington Emergency Communications Link
MOLNIYA	Soviet (FSU) satellite
MOM	Ministry of General Machine Building (FSU)
MOMCOMS	Man-on-the-Move Communications System
MOOTW	Military Operations Other Than War
MOP	(1) JCS Memorandum of Policy; (2) Ministry of Defense Industry (FSU)
MOPOT	Mobile PSYOP Transmitter
MOPP	Mission-Oriented Protective Posture
MOPS	Million Operations per Second
MORL	Manned Orbital Research Laboratory
mort	Mortar

MORTREP	Mortar Bombing Report
MOS	(1) Military Occupational Specialty; (2) Maritime Operational Intelligence Summary; (3) Marine Observation Satellite
MOSFET	Metal-Oxide Semiconductor Field-Effect Transistor
MOSS	Manned Orbital Space Station
MOST	Mosaic Optical Sensor Technology
MOSW	Military Operations Short of War
MOT	Military Ocean Terminal
MOTIF	Maui Optical Tracking and Identification Facility
MOU	Memorandum of Understanding
MOUT	Military Operations in Urban Terrain
MOV	Military Owned Vehicle
MP	(1) Military Police; (2) Military Personnel
MP&B	Mission Planning and Briefing
MPA	(1) Maritime Patrol Aircraft; (2) Mission and Payload Assessment; (3) Mission Planning Agent
MPARE	Mission Planning, Analysis, Rehearsal, and Execution System
MPC	(1) Mobile Processing Center; (2) Manpower and Personnel Center; (3) Message Processing Center; (4) Media Production Center
MPDS	Message Processing and Distribution System
MPDT	Message Processing Distribution Terminal
MPEG	Motion Picture Experts Group
MPF	(1) Maritime Prepositioned Force; (2) Message Processing Facility; (3) Mission Planning Folder; (4) Media Production Center
MPF-E	Maritime Prepositioning Force Enhanced
MPI	Mean Point of Impact
MPM	Mission Planning Module
MPN	MSE Packet Network
MPP	Massively Parallel Processing
MPRS	Mission Planning and Rehearsal Segment
MPS	(1) Maritime Prepositioned Ships; (2) Message Processing System; (3) Master Personnel System; (4) Modular Printing System
MPSOC	Multi-Purpose Satellite Operations Center
MPSS	Ministry of Communications Equipment Industry (FSU)
MPWS	Mobile Protected Weapon System
MQS	Military Qualification and Standards System
MR	(1) Military Region; (2) Medium Range; (3) Motorized Rifle
MRB	Motorized Rifle Battalion
MRBM	Medium-Range Ballistic Missile
MRC	(1) Movement Report Center; (2) Military Region Command; (3) Motorized Rifle Company; (4) Major Regional Contingencies; (5) Major Regional Conflict
MRCA	Multirole Combat Aircraft
MRCS	Medium-Resolution Camera System

MRD	(1) Mission Rehearsal Device; (2) Motorized Rifle Division
MRDBS	(1) MASINT Requirements Data Base System; (2) Measurement and Signature Intelligence Requirements Database
MRDFS	Man-Transportable Radio Direction-Finding System
MRDC	Missile Research and Development Command (U.S. Army)
MRF	Ministry of Radio Industry (FSU)
MRI	Military-Related Intelligence
MRK	Manual Remote (re)Keying
MRL	(1) Multiple Rocket Launcher; (2) Master Requirements List
MRLS	Multiple Rocket Launcher System
MRLOGAEUR	Minimum Required Logistics Augmentation Europe
MROC	(1) Multiple-Command Required Operational Capability; (2) Minimum Required Operational Capabilities
MRP	Mobilization Readiness Project
MRPE	Mobile Receive Processing and Exploitation
MRR	Motorized Rifle Regiment
MRS	Movement and Reinforcement Study
MRT	(1) Mobile Remote Terminal; (2) Miniature Receiver Terminal
MR-UAV	Medium-Range Unmanned Airborne Vehicle
MRV	Multiple Reentry Vehicle
MRVC	Multi-Rate Voice Card (Red Switch)
ms	Millisecond
MS	(1) Multispectral; (2) Mobilization Station
M&S	Modeling and Simulation
m/s	Meters per Second
MS-DOS	Microsoft Disk Operating System
MSA	(1) Military Strength Assessment; (2) Minimum Safe Altitude
MSAM	Medium Surface-to-Air Missile
MSB	Minesweeping Boat
MSC	(1) Military Sealift Command; (2) Coastal Minesweeper; (3) Major Subordinate Command (NATO); (4) Military Staff Committee
MSCD	Military Support to Civil Defense
MSCS	Multiple Source Correlation System
MSCT	Training Coastal Minesweeper
MSD	(1) Minesweeping Drone; (2) Mensuration Support Data
MSDF	Maritime Self-Defense Force (Japan)
MSE	Mobile/Multi Subscriber Equipment (Network) (U.S. Army)
MSEL	Master Scenario Events List
MSF	(1) Fleet Minesweeper; (2) Mobile Strike Force; (3) Medicines Sans Frontiers
MSG	(1) Marine Security Guard; (2) Military Support Group
Msg	Message
MSGGEN	Message Generator
MSH	Mine Hunter

MSI	(1) Inshore Minesweeper; (2) Multi-Spectral Imagery; (3) Multisensor Interpretation
MSIC	Missile and Space Intelligence Center
MSID	Message Identifier
MSIP	(1) Multi-Spectral Image Processor; (2) Multisensored Intelligence Processor
MSK	Minimum Shift Keying
MSL	(1) Missile; (2) Mean Sea Level
MSM	(1) Minesweeper (River); (2) Ministry of Medium Machine Building (FSU)
MSN	Mission

OUTS	Operational Unit Transportable System
OVOP	Overt Operational Proposal
OVPF	Object-Oriented Vector Product Format

P

P	Peacetime
P2E2I	Pre-Planned Essential Elements of Information
P-3H	Land-Based Anti-Submarine Warfare Patrol Aircraft (re-engined)
P3I	Pre-Planned Product Improvement
PA	(1) Pulse Amplitude; (2) Probability of Arrival; (3) Public Affairs; (4) Preliminary Assessment; (5) Proper Authority
PAA	(1) Primary Aircraft Authorized; (2) Peer Access Approval
PA ANG	Pennsylvania Air National Guard
PAATS	Precision Approach Area Tracking System
PABX	Private Access Branch Exchange
PAC	Pacific
PACAF	Pacific Air Forces
PACCAAT	USPACOM Command and Control AUTODIN Access Terminal
PACCS	Post-Attack Command and Control System
PACE	Portable Acoustic Collection Equipment
PACFAST	Pacific Forward Area Support Team
PACFLT	Pacific Fleet
PACOM	U.S. Pacific Command
PACOPS	Pacific Air Force Operations
PACTAIS	Pacific Theater Air Intelligence System
PACTIDS	PACOM Theater Intelligence Data System
PACVTCN	Pacific Video Teleconferencing Network
PAD	Program Action Directive
PADAR	Passive Airborne Detection & Ranging
PA&E	Program Analysis and Evaluation
PAE	Peer Access Enforcement
PAF	Production Analysis and Fusion
PAI	Project Assignment Instruction
PAIDS	PACOM Area Imagery Distribution System
PAIS	(1) Personnel Authentication Identification System; (2) Prototype Advanced Indicator System; (3) Pacific Air Intelligence System
PAL	Permissive Action Link
PALAPA	Indonesian Satellite
PALS	Photo Area & Location System
PAM	(1) Payload Assist Module; (2) Penetration Augmented Munition
PAMIS	Psychological Operations Automated Management Information System
PANAMSAT	PAN American Satellite (Communications System)
PANMAN	Panama Metropolitan Area Network
PAO	(1) Product Activity/Operational Code; (2) Public Affairs Officer
PAOC	PACAF Air Operations Center

PAR	(1) Precision Approach Radar; (2) Perimeter Acquisition Radar; (3) Phased-Array Radar; (4) Population at Risk; (5) Program Assessment Review
PARCS	(1) Perimeter Acquisition Radar Attack; (2) Perimeter Acquisition Characterization System
PARINT	Partial Intercept
PARIS	Pacific Army Intelligence System
PARMIS	Peacetime Airborne Reconnaissance Management Information System
PARPRO	(1) Peacetime Aerial Reconnaissance Program; (2) Preplanned Application of Reconnaissance Programs
PAS	(1) Plans and analysis Staff; (2) Pan American Satellite
PASEP	Passed Separately
PASS	(1) Photo Interpretation Analyst Support System; (2) PACOM IPAC Intelligence Computer System Analyst Support System; (3) PACOM ADP Server Site
PASS-E	USPACOM ADP Server Site-EASTPAC
PASSEX	Passing Exercise (Naval)
PASS-H	USPACOM ADP Server Site, Hawaii
PASS-J	USPACOM ADP Server Site, Japan
PASS-K	USPACOM ADP Server Site, Korea
PAT	(1) Payload Associated Transporter; (2) Planning Assistance Team; (3) Process Action Team
PATREP	Patrol Report
PATRIOT	Phased Array Tracking to Intercept of Target
PATRIOT PAC III	Phased Array Tracking to Intercept of Target Advanced Capability III
PATRON	Patrol Squadron (Navy)
PATWING	Patrol Wing
PAVE	USAF Programs Connected (Night) Avionics, Target Designators, Vision
PAWS	(1) Portable Analyst Work Station; (2) Prototype Analytical Workstation; (3) Portable ASAS Workstation
PAX	Passengers
PB	(1) Particle Beam; (2) Patrol Boat
PB(A)(H)	Patrol Boat (Air Cushion) (Hydrofoil)
PBAC	Program Budget Activity Committee
PBC	Program and Budget Committee
PBD	(1) Program Budget Decision; (2) Patrol Boat Drone
PBEIST	Planning Board for European Inland Surface Transport
PBL	Patrol Boat, Light
PBN	Public Broadcasting Network
PBOS	Planning Board for Ocean Shipping
PBR	(1) River/Roadstead Patrol Boat (Navy); (2) Precision Bombing Range
PBTN	Panama Backbone Transport Network
PBV	Post-Boost Vehicle
PBW	Particle Beam Weapon

PBX	Private Branch Exchanges
PC	(1) Patrol Craft; (2) Positive Control; (3) Production Control; (4) Personal Computer; (5) Project Coordinator; (6) Parallel Computing; (7) Provide Comfort; (8) Patrol Coastal
PCA	Point of Closest Approach
PCAC	Primary Collection and Analysis Center
PCC	(1) POADS Computer Center; (2) Program Coordinating Committee
PCD	(1) Program Change Decision; (2) Positive Control Document
PCE	Patrol Escort
PCF(A)(H)	Fast Patrol Craft (Air Cushion) (Hydrofoil)
PCFS	Fire Support Patrol Craft
PCH	Patrol Craft (Hydrofoil)
PC II	PROVIDE COMFORT II
PCL	Parallel Communications Link
PCM	Pulse Code Modulation
PCMCIA	Personal Computer Memory Card International Association
PCN	(1) Production Control Number; (2) Packet Switching Node; (3) Personal Communications Networking
PCP	(1) Project Concept Proposal; (2) Program Change Proposal
PCR	(1) Performance and Cost Report; (2) Program Change Request
PCS	(1) Publication Control Sheet; (2) Permanent Change of Station; (3) Submarine Chaser; (4) Personal Communications System; (5) Primary Control Station
PCS/UPT	Personal Communications Services/Universal Personal Telecommunications
PCSF	Fire Support Patrol Craft
PCT	Training Patrol Craft
PCTN	Pacific Consolidated Telecommunications Network
PCTCS	Pentagon Center Telecommunications System
PCZ	Protected Communications Zone
PD	(1) Probability of Damage; (2) Presidential Directive; (3) Pulse Duration; (4) Passive Detection; (5) Point Detonation (Fuse)
PDA	Personal Digital Assistant
PDB	PSYOP Dissemination Battalion
PDC	Propaganda Development Center
PDD	Presidential Decision Directive
PDI	Principal Deputy for Intelligence
PDF	Panamanian Defense Force
PDL	Program Design Language
PDM	(1) Program Decision Memorandum; (2) Pulse Duration Modulation
PDMS	Point Defense Missile Systems
PDMT	Pursuit Deterrent Munition Trainer
PDOP	Position Dilution of Precision

PDP	(1) Program Decision Paper; (2) Programmable Data Processor
PDR	Preliminary Design Review
PDS	(1) Passive Detection System; (2) Power Distribution System; (3) Production Deconfliction System; (4) Protected Distribution System PDSC PACOM Data Systems Center
PDSS	Post-Deployment Software Support
PDU	Protocol Data Unit
PDUSD(A&T)	Principal Deputy Under Secretary of Defense (Acquisition & Technology)
PE	(1) Probable Error; (2) Personnel Equipment; (3) Program Element; (4) Preliminary Exploitation; (5) Peace Enforcement
PEAD	Presidential Emergency Affairs Documents
PEAS	(1) Psychological Operations Effectiveness Analysis Subsystem; (2) PSYOP Effects Analysis System
PEC	(1) Pacific Command Electronic Intelligence Center; (2) Program Element Code
PEG	(1) Photo Exploitation Group; (2) Priority Exploitation Group; (3) Priorities for ELINT Guidance; (4) Program Element Group
PEH	Probable Error in Height
PEI	Production Enhancement Initiative
PEILS	PACOM Executive Intelligence Summary
PEM	(1) Purchased Equipment Maintenance; (2) Program Element Monitor
PEO	Peace Enforcement Operation
PEOC4I	Program Executive Officer for Command, Control, Communications, Computers, and Intelligence
PEP	Photographic Exploitation Products
PER	Personnel
PERIGEE	Perspective Image Generation and Exploitation System
PERINTREP	Periodic Intelligence Report
PERINTSUM	Periodic Intelligence Summary
PERM	Processless Electron Recording Media
PERMCERT	Permanent Certification
PERSCON	Personal Contact
PEO	Program Executive Officer
PEO-CCS	PEO Command and Control Systems
PERSEC	Personnel Security
PERT	Program Evaluation and Review Technique
PES	Positive Enable System
PESM	Passive Electronic Support Measures
PF	Protection Factor
PFADS	Psychological Operations Foreign Area Data Subsystem
PFD	Power Flux Density
PFIAB	President's Foreign Intelligence Advisory Board
PFLP	Popular Front for the Liberation of Palestine
PFM	Production Functional Manager

PFOD	Presumptive Finding of Death
PG	(1) Patrol Combatant; (2) Persian Gulf; (3) Precision Guidance
PGDR	Portable Data Reduction System
PGF	Patrol Ship
PGG	Guided-Missile Patrol Combatant
PGH	Patrol Gunboat (Hydrofoil)
PGIP	Postgraduate Intelligence Program
PGM	Precision-Guided Munitions
PGR	Reconnaissance Patrol Combatant
PGW	Precision Guided Weapon
PGSS	Publications and Graphics Subsystem
PHD	Phase History Data
PHIBGRU	Amphibious Group
PHIBRON	Amphibious Squadron
PHIGS	Programmer's Hierarchical Interactive Graphics
PHM	Patrol Combatant Missile (Hydrofoil)
PHOTOINT	Photographic Intelligence
PHOTORECON	Photographic Reconnaissance
PHS	Public Health Service
PHYSEC	Physical Security
PI	(1) Photographic Interpretation/Interpreter; (2) Principal Investigator
PIAC	PACOM Intelligence Architecture Committee
PIB	(1) PACOM Intelligence Board; (2) Photo Interpretation Brief
PIC	(1) Pacific Imagery Processing and Interpretation Center; (2) Parent Indicator Code; (3) Processing and Interpretation Center
PICON	Portable ICON
PIF	(1) Processing and Interpretation Facility; (2) Project Investment Fund
PIGS	Passive Infrared Guidance System
PIICS	PACOM - Intelligence Computer System
PILOT	Phased Integrated Laser Optics Technology
PIM	Path of Intended Movement
PIN	(1) Preliminary Imagery Nomination File; (2) Photographic Intelligence Note; (3) Personal Increment Number; (4) Plan Identification Number; (5) Personal Identification Number; (6) PACOM Intelligence Net
PINES	PACAF Interim National Exploitation Segment/System

PIP	(1) Project Implementation Plan; (2) Product Improvement Package
PIR	(1) Photo Interpretation Report; (2) Priority Intelligence Requirement
PIRATE	Portable Imagery Receive and Transmission Equipment
PIREP	Pilot Report
Pixel	Picture Element
PJ	Pararescue Jumper
PK	(1) Probability of Kill; (2) Soviet (FSU) Light Machinegun; (3) Peacekeeping
PKA	Public Key Algorithm
PKC	Public Key Cryptography
PKK	Kurdistan Worker's Party
PKO	Peace-Keeping Operation
PKSD	Programmable Key Storage Device
PL	(1) Phase Line; (2) Plans and Operations Division; (3) Public Law
PLA	(1) Plain Language Address; (2) People's Liberation Army (China)
PLARS	Position Locating and Reporting System
PLGR	Precision Lightweight GPS Receiver
PLL	Prescribed Load List
PLNG	Planning
PLRS	Position Location Reporting System
PLO	Palestinian Liberation Organization
PLP	PSYOP Leaflet Payload
PLS	Pre-Launch Survivability
PLSDU	Physical Layer Service Data Unit
PLSS	U.S. Precision Location Strike System
PLT/Plt	Platoon
PM	(1) Preventive Maintenance; (2) Post Meridian (after noon); (3) Prime Mover; (4) Preventive Medicine; (5) Program Manager; (6) Prime Minister; (7) Provost Marshall; Project Manager; (8) Production Manager; (9) Peacemaking
PMATS	Program Management Automated Tool Set
PMB	Program Management Board
PME	Professional Military Education
PMF	Project Management File
PMGM	Program Manager's Guidance Memorandum
PMIS	(1) Personnel Management Information System; (2) PSYOP Management Information Subsystem
PMO	(1) Program Management Office; (2) Project Management Office
P Model	Preproduction Model
PMP	Program Management Plan
PMPTS	Program Management Performance Tracking System
PMR	Primary Mission Readiness
PMRP	Program Manager's Recommended Program

PMS	(1) Project Management System; (2) Preventive Maintenance System; (3) Precision Mensuration Software
PMSP	Preliminary Message Security Protocol
PMTC	Pacific Missile Test Center (Navy)
PN	Packet Network
PNAF	Prime Nuclear Airlift Force
PNCC	PASS Network Control Center
PNEK	Post-Nuclear-Event Key
PNE(T)	Peaceful Nuclear Explosion (Treaty)
PNG	Persona Non Grata
PNL	Prescribed Nuclear Load
PNUTS	Possible Nuclear Underground Test Site
PNVS	Pilot Night Vision System
PO	(1) Petty Officer; (2) Peace Operations
POA&M	(1) Plan of Action and Milestones; (2) Plan of Attack and Milestones
POADS	Psychological Operations Automated Data System
POAS	Psychological Operations Automation System
POB	(1) Place of Birth; (2) Psychological Operations Battalion
POC	(1) Point of Contact; (2) Program of Cooperation; (3) Psychological Operations Company
POC/ET	Proof of Concept/Experimental Testbed
POCS	Portable Oxygen Charging System
POD	Port of Debarkation
POE	(1) Plan of Execution; (2) Point of Entry; (3) Port of Embarkation
POES	Polar Orbiting Environmental Satellite
POG	Psychological Operations Group
POI	Program of Instruction
POL	(1) Petroleum, Oils, and Lubricants; (2) Political
POL-MIL	Political-Military
POLAD	Political Advisor
POM	(1) Program Objective Memorandum; (2) Preparation for Overseas Movement
POMCUS	Prepositioned Organizational Materiel Configured in Unit Sets
POOS	Parachute Offset Oxygen System
POP	Point of Presence
POR	Preparation for Oversees Replacement
PORTS (JOPES)	(1) Portable Remote Telecommunications System; (2) Seaports Files; (3) Portable Receive and Transmit System
PORTS-1N	Portable Receive and Transmit System - 1N
PORTSREP	Ports Report File (JCS/J-3)
Pos	Position
POSIX	Preliminary Open System Interface Standard
Pos-Nav	Positioning and Navigation
POST	Prototype Ocean Surveillance Terminal

POTBI	Places, Organizations, Things, Biographics, Intangibles
POTF	Psychological Operations Task Force
POV	Privately Owned Vehicle
POW	Prisoner of War
POWERR	Prototype Workstation for Electronic Warfare and Radio
PP	Preprogramed
PPO	Pilot and Payload Operator
PPBES	Planning, Programming, and Budgeting Execution System
PPBS	Planning, Programming, and Budgeting System
PPC	Printing and Publications Center
PPDB	Point Positioning Data Base
PPF	Photographic Processing Facility
PPGM	Planning and Programming Guidance Memorandum
PPI	Pulse Position Indicator
PPIF	Photographic Processing and Interpretation Facility
PPL	Preferred Products List
PPM	(1) Parts Per Million; (2) Pulse Position Modulation
PPMS	Power Pattern Measurement System
PPS	Precision and Positioning Service
PR	(1) Production Requirement; (2) Personnel Recover
PRA	(1) Permanent Restricted Area; (2) Population Reception Area (NATO)
PRAM	Allied Mine
PRB	Program Review Board
PRBAC	Partition Rule Base Access Control
PRC	(1) Policy Review Committee; (2) People's Republic of China
PRC(I)	Policy Review Committee (Intelligence) (now SIG(I))
PRCSO	Peacetime Reconnaissance and Certain Sensitive Operations
PRD	(1) Production Responsibilities Document; (2) Presidential Review Directive
PRDA	Photo Reconnaissance Damage Assessment
PREMSS	Photo Reconnaissance and Exploitation Management Support System
PREP/RAMP	Pre-Edit Processor/Report and Message Processor
PRF	Pulse Repetition Frequency
PRG	Program Review Group
PRGB	Point Reference Guild Book
PRI	(1) Pulse Repetition Interval; (2) Primary Rate Interface
PRIMAC	Production and Inventory Management and Control System
PRM	Presidential Review Memorandum
PROC	Processing/Process
PROCOMM	Terminal Emulation Software for DOS Workstations
PROD	Production
PROG	Program
PROM	Programmable Read-Only Memory

PROPIN	Caution — Proprietary Information Involved
PRP	Portable Radio Program
PRPG	Preliminary Reference Point Graphic
PRS	PACOM Remote System
PRSCO	Peacetime Reconnaissance and Sensitive Collection Operations
PRT	Personal Rapid Transit
PRTB	Soviet (FSU) Mobile Rocket Technical Base
PRU	Photographic Reconnaissance Unit
PS	(1) Processing Station; (2) Processing Segmext; (3) Policy Support
Ps	Permanent snowfields
PSAA	Pacific Special Activities Area
PSAC	President's Scientific Advisory Committee
PSB	Harbor Patrol Boat
PSC	Principal Subordinate Command (NATO)
PSDU	Physical Layer Service Data Unit
PSI	(1) Pounds Per Square Inch; (2) Personnel Security Investigation
PSK	Phase Shift Keying
PSL	Protected Services List
PSN	(1) Packet Switching Node; (2) Public Switched Network; (3) Packet Switched Network
Psns	Positions
PSO	(1) Protective Structure Only; (2) Personnel Security Office; (3) Post Security Officer
PSP	(1) Pierced Steel Planking; (2) Planning Support Package
PSPS	PSYOP Studies Program Subsystem
PSR	(1) Post-Attack Status Report; (2) Periodic Status Report
PSRC	Presidential Selected Reserve Call-Up
PSS	Packet Switched Service
PST	Pacific Standard Time
PSTN	Public Switched Telecommunications Network
PSYOP	Psychological Operations
PSYOPGP	Psychological Operations Group
PSYWAR	Psychological Warfare
PT	(1) Torpedo Boat; (2) Part Time; (3) Physical Training
Pt	Peat
PTADB	Planning Terrain Analysis Data Base
PTG	Missile Attack Boat
PTGP	Part-Time Graduate Program
PTIAP	PACOM Theater Intelligence Architecture Program
PTL	Small Torpedo Boat
Ptl	Patrol
PTN	Pacific Tributary Network
PTP	(1) Probability to Penetrate; (2) Point-to-Point
PTR/P	Paper Tape Reader/Punch

PTS	Predicasts Terminal System
PTSR	Postmobilization Training Support Requirement
PTSS	Passive Thermal Suppression Suit
PTT	(1) Training Torpedo Boat; (2) Postal, Telephone, and Telegraph; (3) Push to talk
PTTP	USPACOM Tactics, Techniques, and Procedures
PTTDS	Projected Target Trends Data Sheet (FTL)
PTTP	USPACOM Tactics, Techniques, and Procedures
Pub	Publication
PUG	Partially Underground
PUP	(1) Performance Upgrade Program; (2) Pop-Up Point
PV	Physical Vulnerability
PVDS	Physical Vulnerability Data Sheets
PVITS	Portable Video Imagery Transmission System
PVST	Port Visit
PVO	(1) Air Defense (FSU); (2) Private Voluntary Organization
PVTM	Physical Vulnerability Technical Memorandum
PW	(1) Prisoner(s) of War; (2) Pulse Width
PWDS	Protected Wireline Distribution System
PWHQ	Primary War Headquarters
PWI	PACOM Warning Intelligence
PWIPS	Pre-Launch Warning Intelligence Processing System
PWRS	Prepositioned War Reserve Stock
PZ	Pick-Up Zone

Q

QA	Quality Assessment
Q&A	Question and Answer
QBE	Query by Example
QC	Quality Control
QEA	Quick Erect Antenna
QM	Quartermaster
Q-MESSAGE	Classified Message on Navigational Hazard
QOL	Quality of Life
QPQ	Quid Pro Quo
QPSK	Quadrature Phase Shift Keying
Q/R	Query/Response
QRA	Quick Reaction Alert
QRC	Quick Reaction Capability
QRF	Quick Response Force
QRG	Quick Response Graphic
QRLS	Quick Reaction Launch System
QRMP	Quick Response Multicolor Printer
QRP	Quick Reaction Package
QRRC	Quarterly Readiness Report to Congress
QRT	(1) Quick Reaction Task; (2) Quick Reaction Terminal
QRSA	Quick Reaction Satellite Antennae
QRSP	Quick Reaction Shuttle Payload
QSR	Quick Strike Reconnaissance
QSTAG	Quadripartite Standardization Agreement
QUICKSAT	Modified AN/FSC-78
QUIP	Quarterly Intelligence Production Listing

R

R	(1) Rock Outcrops; (2) Receiver
RA	(1) Restricted Area; (2) Responsible Agency; (3) Resident Agent
RAAF	Royal Australian Air Force
RAAP	Rapid Application of Air Power
RAC	Resident Agent in Charge
RACE	Rapid Automatic Cryptographic Equipment
RAF	Royal Air Force

RF-4	Designator for Reconnaissance Aircraft (USAF/USMC)
RFA	Restricted Fire Area
RFC	Request for Collection
RFD	Radio Frequency Distribution
RFE/RL	Radio Free Europe/Radio Liberty
RFI	(1) Radio Frequency Interference; (2) Request for Information
RFIS	Reserve Forces Intelligence School
RFL	Restrictive Fire Line
RFMETS	Radio Frequency Mobile Electronics Test Set
RFP	(1) Remaining Force Potential; (2) Radio Frequency Pulse; (3) Request for Proposal; (4) Request for Production
RFPI	Rapid Force Projection Initiative
RFPW	Radio Frequency Pulse Weapon
RFR	Request for Requirements
RFS	Request for Service
RFTB	Reserve Force Target Base
RFTL	Reserve Forces Target List
RGB	Red-Green-Blue
RGR	(1) Ranger; (2) Roger
RGS	Relay Ground Station
RGT	Regiment
RHAW	Radar Homing and Warning
RHIB	Rubber Hull Inflatable Boat
RI	Routing Indicator
RIB	Rigid Inflatable Boat
RIC	(1) Regional Intelligence Center; (2) Resource Identification Code
RIF	Reduction in Force
RII	Request for Intelligence Information
RIM	ROTHR Interface Module
RIMPAC	U.S. Naval Exercise
RIMS	Requirements Inventory Management System
RINT	Unintentional Radiation Intelligence
RIO	Radar Intercept Officer

RIP	(1) Register of Intelligence Publications; (2) Reconnaissance Information Point
RIPL	Reconnaissance and Interdiction Planning Line (NATO)
RIPSO	Revised IP Security Option
RISC	Reduced Instruction Set Computer
RISOP	Red Integrated Strategic Operations Plan
RISP	Reserve Intelligence Support Project
RIT	Remote Imagery Transceiver
RITS	Remote Imagery Transceiver System
RJITF	Regional Joint Intelligence Training Facility
RL	(1) Rocket Launcher; (2) Radio Liberty; (3) Receive Location
RLG	Ring Laser Gyro
RM	(1) Requirements Management; (2) Resource Management
RMBUX	Rocky Mountain Basic UNIX
RMEC	Regional Military Emergency Coordinator
RMG	Resource Management Group
RMO	(1) Records Management Officer; (2) Requirements Management Office
RMS	(1) Requirements Management System; (2) Remote Monitoring System
RNAV	Area Navigation
RNO	Regional Nuclear Option
RNP	(1) Radio Navigation Point; (2) Remote Network Processor
RO	(1) Reporting Officer; (2) Radar Operation; (3) Receive Only; (4) Resident Office
RO/RO	Roll-On/Roll-Off (Ship)
ROB	Radar Order of Battle
ROC	(1) Required Operational Capability; (2) Republic of China; (3) Reconnaissance Operations Center; (4) Required Operational Capability; (5) Regional Operations Center
ROCC	Regional Operations Control Center
ROD	Reconnaissance Operations Division
RODCA	(1) Reporting of DoD HUMINT Collection Activities; (2) Message Caveat
ROE	Rules of Engagement
ROF	(1) Rate of Fire; (2) Remote Operating Facility
ROFA	Remote Operating Facility Airborne
ROIPB	Rear Operations Intelligence Preparation of the Battlefield
ROK	Republic of Korea
ROKA	Republic of Korea Army
ROKAF	Republic of Korea Air Force
ROKN	Republic of Korea Navy
ROKUSCFC	Republic of Korea and U.S. Combined Forces Command
ROM	Read Only Memory
RON	Remain Overnight
ROP	Remote Operating Position
RORSAT	Soviet (FSU) Radar Ocean Reconnaissance Satellite

ROSE	Remote Optical Sensing of the Environment
ROSS	Refinement of SIGINT Support
ROT	Rotating Position
ROTC	Reserve Officer Training Corps
ROTHR	Relocatable Over-the-Horizon Radar
ROU	Radius of Uncertainty
ROW	Rest-of-World
RP	(1) Reference Point; (2) Release Point
RPA	Reserve Personnel Allotment
RPB	Regional Preparedness Board
RPC	(1) Regional Preparedness Committee; (2) Regional Reporting Center; (3) Remote Procedure Calls; (4) Rapid Positioning Capability
RPE	Reconnaissance Planning Element
RPG	(1) Soviet (FSU) Shoulder-Fired Antitank Grenade Launcher; (2) Report Program Generator
RPK	Soviet (FSU) Light Machinegun (similar in design to the AK rifle)
RPM	(1) Revolutions per Minute; (2) Rounds per Minute
RPT	Report
RPTG	Reporting
RPV	Remotely Piloted Vehicle
RQS	Rescue Squadron
RQT	(1) Reliability Qualification Tests; (2) Requirement
RQMTS	Requirements
RR	(1) Railroad; (2) Radio Relay
R&R	Rest and Recreation
RRC	Regional Reporting Center
RRDB	Rapidly Reconfigurable Data Base
RRF	(1) Ready Reserve Force; (2) Rapid Reaction Force (ACE)
RRG	Remote Receive Group
RRI	Response to Request for Information
RRICS	Rapid Response Imagery Capability System
RRII	Response to Request for Intelligence Information
RRM	Red Resource Monitoring
RRP	Rapid Reinforcement Plan
RRS	Remote Receive Station
RRT	Radio Receive/Transmitter
RRTP	Rail-to-Road Transfer Point
RS	Reconnaissance/Surveillance
R&S	Reconnaissance and Surveillance
RSB	PSYOP Regional Support Battalion
RSBN	Short-Range Navigation System (FSU)
RSDN	Long-Range Navigation System (FSU)
RSC	(1) Regional Support Commands; (2) PSYOP Regional Support Company
R&SC	Reconnaissance and Surveillance Center

RSE	Ranger Support Element
RSI, R/S/I	Rationalization, Standardization and Interoperability
RSN	Red Switched Network
RSO	(1) Reconnaissance & Survey Officer; (2) Regional Security Officer
RSOC	Regional SIGINT Operations Center
RSOD	Remote Satellite Operations Demonstration
RSOG	Reserve Special Operations Group
RSR	(1) Resource Status Report; (2) Required Supply Rate; (3) Radar Service Request
RSSC	Regional Space Support Centers
RSSP	Reconnaissance Support Survivability Program
RST	(1) Recovery Support Team; (2) Regional Survey Team
RSTA	Reconnaissance, Surveillance, & Target Acquisition
RSW	Reflected Shockwave
RT	(1) Real Time; (2) Radio Telephone; (3) Relocatable Target; (4) Radius of Target
RTA	Residual Threat Assessment
RTAPS	Relocatable Target Adaptive Planning Support
RTASS	Remote Tactical Airborne SIGINT System
RTCE	Rapid Targeting Capability Europe
RTG	Reconnaissance Technical Group (TAC, USAFE, PACAF)
RTIC	(1) Regional Threat Information Cell; (2) Real-Time Information to the Cockpit
RTIP	Real-Time Interactive Processor
RTM	Receiver/Transmitter/Modem
RTOS	Real-Time Optical System
RTP	Rail Transfer Point
RTS	(1) Reconnaissance Technical Squadron; (2) Real-Time Simulator
RTS-I	Regional Training Site(s)-Intelligence
RTSP	Real-Time Signal Processor
RU	(1) Roundup; (2) Resident Unit
RUNT	Russian Underground Nuclear Test
RURPOP	Rural Population File
RV	(1) Reentry Vehicle; (2) Radius of Vulnerability; (3) Reconnaissance Vehicle
RVT	Remote Video Terminal
RW	(1) Radiological Warfare; (2) Rotary Wing; (3) Reconnaissance Wing
RWH	Radar Warning & Homing
RWI	Radio Wireline Interface/Integration
RWO	Reconnaissance Watch Officer
RWR	Radar Warning Receiver
RWS	Remote Workstation
RX	Receive
RZ	Recovery Zone

S

S	Secret
/s/	Signature
S-1	Personnel Staff Officer
S-2	Intelligence Staff Officer; Brigade, Battalion, and Armored Cavalry
S-3	Operations Staff Officer
SA	(1) Logistics Staff Officer; (2) Special Access; (3) Situational Awareness (4) Signals Analysis; (5) Surface-to-Air; used to identify FSU Surface-to-Air Missiles, e.g., SA-7/GRAIL; (6) Situation Assessment; (7) Security Assistance; (8) Special Agent; (9) Stand Alone; (10) Secretary of the Army; (11) Systems Administrator; (12) Strategic Attack
SAA	(1) Special Area Assessments; (2) Strategic Air Army
SAAC	Strategic Analysis Applications Center
SAAM	Special Assignment Airlift Mission
SAASE	Standard Data Element-Based Automated Architecture Support Environment
SACC	Supporting Arms Coordination Center
SACCS	Strategic Air Command Automated Command & Control System
SACS	(1) Secure Access Control System; (2) STU-III Access Control System
SAE	Service Acquisition Executive
SAB	Subject as Above
SAC	(1) Strategic Air Command; (2) Scientific Advisory Committee; (3) Senate Appropriations Committee
SACDIN	SAC Digital Network
SACEUR	Supreme Allied Commander, Europe (NATO)
SACLANT	Supreme Allied Commander, Atlantic (NATO)
SACLANTREPEUR	SACLANT Representative in Europe
SACOM	Southern Area Command
SACOS	SAC Operational Staff
SACWARNS	(1) Strategic Air Command Indications and Warning; (2) SAC Warning System
SADARM	Sense and Destroy Armor
SADF	South African Defense Force
SADO	Senior Air Defense Officer
SADT	Structured Analysis Design Technique
SAEDA	Subversion and Espionage Directed Against the Army
SAF	(1) Soviet (FSU) Air Force; (2) Source Acquisitions File; (3) Secretary of the Air Force; (4) US Air Force Staff
SAFE	(1) Support for the Analysts' File Environment; (2) Selected Area for Evasion
SAFF	Safing, Arming, Fuzing, and Firing
SAF/O/T	Security Assistance Force/Organization/Team
SAG	(1) Study Advisory Group; (2) Surface Action Group; (3) Strategic Advisory Group

SAGE	Semiautomatic Ground Environment (Radar)
SAI	Strategic Command Administrative Instruction
SAIB	Safe Area Intelligence Brief
SAID	Safe Area Intelligence Description
SAIS	Strategic Aerospace Intelligence System
SAL	(1) Strategic Arms Limitation; (2) Submarine Alerting and Locating
SALT	(1) Strategic Arms Limitation Talks; (2) Supporting Arms Liaison Team
SALUTE	Size, Activity, Location, Unit, Time, Equipment (spot report format)
SAM	(1) Surface-to-Air Missile; (2) Summary Assessment Matrix
SAMOB	Surface-to-Air Missile Order of Battle
SAMSO	Space And Missile System Organization
SAMT	State of the Art Medium Terminals
SAO	(1) Special Access/Activities Office; (2) Select Attack Option; (3) Special Access Only; (4) Security Assistance Organization; (5) Security Assistance Office
SAOB	FSU Air Order of Battle
SAOC	(1) Space Actions Officers Course; (2) Sector Air Operations Center
SAOCS	Submarine/Aircraft Optical Communications System

SAPAS	Semiautomatic Population Analysis System
SAR	(1) Search and Rescue; (2) Synthetic Aperture Radar; (3) Special Access Required; (4) Sea-Air Rescue
SARC	Surveillance and Reconnaissance Center
SARDA	Secretary of the Army for Research, Development and Acquisition
SARP	Storage and Retrieval Processor
SARPF	Strategic Air Relocatable Processing Facility
SARSAT	Search and Rescue Satellite-Aided Tracking
SART	Strategic Aircraft Recovery Team
SARV	Strategic Aerospace Reconnaissance Vehicle
SAS	(1) Strategic Area Study; (2) Strategic Aerospace Summary; (3) Special Activities Squadron; (4) Support to Analyst Subsystem; (5) Survivable Adaptive Systems
SASC	Senate Armed Services Committee
SASM	Strategic Air-to-Surface Missile
SASS	(1) Small Aerostat Surveillance System; (2) Systems Acquisition Support Services
SAT	(1) Satellite; (2) Staff Augmentation Team; (3) Satisfactory
SATCOM	Satellite Communications
SATCOMA	Satellite Communications Agency (U.S. Army)
SATKA	Surveillance, Acquisition, Tracking, and Kill Assessment
SATRAN	(1) Satellite Reconnaissance Advanced Notice; (2) Satellite Transmission
SATS	Southwest Asia Telecommunications System
SATVUL	Satellite Vulnerability

SAVE	Situation Analysis and Vulnerability Estimate
SAVI	Systems Analysis of Vulnerability to Intrusion
SAWC	Special Air Warfare Center
SAWG	Simulation and Analysis Working Group
SAWIC	Strike and Amphibious Warfare Intelligence Center
SAWS	Submarine Analyst Work Station
SAWVS	Satellite Attack Warning and Verification System
SB	Sentinel Byte
S-BAND	2 to 4 GHz
SBB	Sustained Bare Base
SBI	(1) Special Background Investigation; (2) Space-Based Interceptor
SBIRS	Space-based Infrared Radar System
SBIS	Sustaining Base Information Services
SBKKV	Space-Based Kinetic Kill Vehicle
SBL	Space-Based Laser
SBM	Single-Point Mooring Buoy
SBR	(1) Special Boat Squadron; (2) Space-Based Radar
SBS	Site Backbone Segment
SBSS	Space-Based Surveillance System
SBU	(1) Special Boat Unit; (2) Sensitive but Unclassified
SBWASS	Space-Based Wide-Area Surveillance System
SC	(1) Science Committee (NATO); (2) Signal Corps; (3) Security Code; (4) Signal Company; (5) System Center; (6) Structural Category; (7) Screen Commander or Coordinator; (8) Air Force Communications-Computers Directorate; (9) Submarine Conversion
SCA	Service Cryptologic Agency
SCAD	Subsonic Cruise Armed Decoy
SCAMP	Sensor Control and Management Platoon
SCAMPI	SOF C3I Telecommunications System
SCARE	Standard Collection Asset Request Format
SCATANA	Security Control of Air Traffic and Air Navigation Aids
SCC	(1) Special Coordination Committee; (2) Standing Consultative Commission (SALT); (3) Surveillance Coordination Center; (4) System Control Center; (5) Space Control Center; (6) Service Component Commander
SC CAT	SOUTHCOM Crisis Action Team
SCC(I)	Special Coordination Committee (Intelligence)
SCCP	Single-Channel Command Post
SCCS-R	Single-Channel Collection System - Rear
SCCTV	Secure Closed-Circuit Television
SCDL	Surveillance and Control Data Link (JSTARS)
SCE	Service Cryptologic Element
SCF	Satellite Control Facility
SCF-UK	Save the Children Federation-UK
SCG	Special Consultative Group (NATO)

SCI	(1) Sensitive Compartmented Information or Information Programs; (2) Source Code Indicator
SCIBS	Sensitive Compartmented Information Billet System
SCIC	State Crime Information Center
SCIF	Sensitive Compartmented Information Facility
SCIM	Subject Codes for Intelligence Management
SCIMITAR	System for Countering Interdiction Missiles and Target Radars
SCINET	Sensitive Compartmented Information Network (DoDIIS)
SCIP	Special Communications Intelligence Package
SCIPMIS	Standard Civilian Personnel Management Information System
SCIPS	Sensitive Compartmented Information Processing System
SCIS	Survivable Communication Information System
SCISS	SOUTHCOM Intelligence Support System
SCI-VTC	Sensitive Compartmented Information-Video Teleconferencing
SC J2	USSOUTHCOM J2
SCL	Standard Conventional Load
SCLNO	SOUTHCOM Liaison Officer
SCM	Security Countermeasures
SCN	Satellite Control Network
SCO	(1) Service Cryptologic Organizations; (2) Sub-Control Office
SCOLA	Satellite Communications for Learning
SCORE	Signal Communications by Orbiting Relay Equipment
SCOTT	Single-Channel Objective Tactical Terminal
SCP	Secure Conferencing Project
SCPC	Single Channel per Carrier
SCS	(1) Signal Collection System; (2) Satellite Control Squadron
SCSC	SOUTHCOM Support Center
SCSI	Small Computer Systems Interface
SCT	(1) Single-Channel Terminal; (2) Single-Channel Transponder
SCUBA	Self-Contained Underwater Breathing Apparatus
SCUD	Nickname of a Missile System
SD	(1) Space Director; (2) Standard Displacement; (3) Senior Director; (4) Security Division; (5) Strategic Command Directive
SDA	(1) Ships Destination Authority; (2) Strike Damage Assessment
S&DA	Strike and Damage Assessment
SDB	Space Data Base
SDC	(1) Strategic Dissemination Company; (2) Strategic Defense Command
SDD	Secure Data Device
SDF	Structured Data Fields
SDHS	Satellite Data Handling System
SDI	Strategic Defense Initiative
SDIE	Special Defense Intelligence Estimate

SDIN	(1) Secure Digital Information Network; (2) Special Defense Intelligence Notice
SDIO	Strategic Defense Initiative Organization
SDIS	Switched Digital Integrated Service
SDLC	Synchronous Data Link Control
SDM	Standoff Destructive Munition
SDMA	Spaced Division Multiple Access
SDMS	SINET Data Management System
SDNRIU	Secure Digital Network Radio Interface Unit
SDNS	Secure Data Network System
SDO	System Development Office
SDOB	Scaled Depth of Burst
SDR	(1) Source-Directed Requirements; (2) System Design Review
SDS	(1) Satellite Data System; (2) SIGINT Direct Support; (3) Satellite Dissemination System; (4) Secondary Dissemination System; (5) Strategic Defense System; (6) Switched Data Services; (7) Spatial Data Server; (8) Small Digital Switch
SDV	(1) Swimmer Delivery Vehicle; (2) SEAL Delivery Vehicle
SDVT	SEAL Delivery Vehicle Team
SDYS	Studies
SE	Southeastern
SEA	(1) Southeast Asia; (2) Senior Enlisted Advisor
SEABEE	Navy Construction Battalion Personnel
SEALANCE	Anti-Submarine Warfare Standoff Weapons (ASW/SOW)
SEAD	Suppression of Enemy Air Defense
SEADS	Southeast Air Defense Sector
SEAGA	Selective Employment Air Ground Alert Forces
SEAL	Sea/Air/Land
SEASTAG	SEATO Standardization Agreement
SEATO	Southeast Asia Treaty Organization
SEAWATCH	NOSIC On-Line Computer System
SEC	(1) Second; (2) Section; (3) Submarine Element Coordinator
SECAF	Secretary of the Air Force
SECARMY	Secretary of the Army
SECC	Survivable Enduring Command Center
SECCLEAR	Security Clearance (Management System)
SECDEF	Secretary of Defense
SECNAV	Secretary of the Navy
SECOM	Security Committee
SECS	Survivable and Enduring Communications System
SECSTATE	Secretary of State
SECTY	Security
SED	Simulated Electronic Deception
SEDSCAF	Standard ELINT Data System Codes and Formats

SEE	(1) System Engineering and Evaluation; (2) Softcopy Exploitation Environment
SEEI	Special Essential Elements of Information
SEEK	Soviet Emigre Exploitation Kit

SESOCC	Southeastern Sector Operations Control Center
SESS	Space Environment Sensor Suite
SET	Sensor Employment Teams
SETAF	Southern European Task Force
SEVOCCS	Secure Voice Command and Control System
SEVOX	Secure Voice
SEWC	Space and Electronic Warfare Commander
SEWCC	SIGINT/Electronic Warfare Coordination Center
SEWS	(1) Satellite Early Warning System; (2) SIGINT Electronic Warfare Subsystem
SF	(1) Special Forces; (2) Standard Form
SFA	Security Fault Analysis
SFAT	Strategic Forces Advisory Team
SFD	Saturated Flux Density
SFEM	Space Forces Engagement Model
SFG	Special Forces Group
SFG-A	Special Forces Group-A
SFG(A)	Special Forces Group (Airborne)
SFOA	Special Forces Operations Area
SFOB	(1) Special Forces Operating Base; (2) Soviet (FSU) Forces Order of Battle
SFOD	Special Forces Operational Detachment

SFODA	Special Forces Operational Detachments-A
SFOD-D	First Special Forces Operational Detachment-Delta
SFOS	Special Forces Operating System
SFQC	Special Forces Qualification Course
SFR	Statement of Functional Requirement
SFRD	Safe Functional Requirements Document
SFT	Secure Fault Tolerant
SFTL	Strategic Future Targets List
SFUG	Security Features Users Guide
SGB	SOUTHCOM Ground Order of Battle
SGDPS	Second Generation Data Processing System
SGEMP	System Generated Electromagnetic Pulse
SGF	(1) Southern Group of Forces (Soviet Forces in Hungary); (2) Synthetic Aperture Radar Ground Facility
SGS	(1) Secretary to the General Staff; (2) Squadron Ground Station
SGT	(1) Satellite Ground Terminal; (2) Sergeant
SHA	Secure Hast Algorithm
SHAPE	Supreme Headquarters Allied Powers Europe (NATO)
SHARES	Shared HF Resources
SHC	Supreme High Command
SHF	Super High Frequency
SHED	Special Handling and Evaluation Detachment
SHELREP	Shell Report
SHF	Super High Frequency
SHOP	Special Handling for Operations Purposes
SHORAD	Short-Range Air Defense
SI	(1) Special Intelligence; (2) Special Instructions
S&IA	Security and Investigative Activities
SIAB	Senior Imagery Advisory Board
SIAD	Strategic Imagery Analysis Detachment
SIAP	Strategic Intelligence Architecture Program
SIB	Special Intelligence Brief
SIC	(1) Subject Indicator Code (NATO message code); (2) System Integration Configuration
SICAM	SIGINT Control and Analysis Module
SICR	Specific Intelligence Collection Requirement
SID	(1) Secondary Imagery Dissemination; (2) Subscriber Identification
SID(S)	Selective Imagery Dissemination (System)
SIDA	Single Integrated Data Base
SIDAC	Single Integrated Damage Assessment Code
SIDPAC	Strategic Imagery Detachment Pacific
SIDS	Secondary Imagery Dissemination System
SIE	Space Intelligence Element
SIF	Special Interrogation Facility

SIFR	Special Intelligence Functional Requirement
Sig	Signal
SIGCEN	U.S. Army Signal Center
SIG-I	Senior Interagency Group for Intelligence
SIGINT	Signals Intelligence
SIGSEC	Signals Security
SIGSUM	SIGINT Summary
SII	Statement of Intelligence Interest
SIIR	Special Imagery Interpretation Report
SIL	Systems Integration Laboratory
SIM	(1) Sensor Interface Module; (2) Systems Integration Management
SIMIR	USSTRATCOM IDHS Monthly Integration Review
SIMM	Single Inline Memory Module
SIMNET	Single Channel Ground/Airborne Radio Sub-Systems
SIMO	SIM Office
SIMP	Space Intelligence Master Plan
SIMS SOUTHCOM	Intelligence Management System
SINCGARS	(1) Single Integrated Channel Ground and Airborne Radio Subsystems; (2) Single Channel Ground-to-Air Radio System
SINET	Strategic Intelligence Network
SINTER	SIGINT/IMINT Interaction
SIO	(1) Senior Intelligence Officer; (2) Space Intelligence Officer; (3) Ship's Intelligence Officer
SIOP	Single Integrated Operational Plan
SIORI	Self-Initiated Operational Readiness Inspection
SIPE	Strategic Intelligence Processing Element
SIPRNET	Secret Internet Protocol Router Network
SIR	(1) Shuttle Imaging Radar; (2) Specific Information Requirements; (3) Spectrum Interferance Resolution
SIRADS	Shared Imagery Repository and Dissemination System
SIRCS	Shipborne Intermediate-Range Combat System
SIREP	Sensitive Information Report
SIRVES	SIGINT Requirements Validation and Evaluation Subcommittee (of SIGINT Committee)
SIS	(1) Significant Indications Summary; (2) Space Intelligence System; (3) Special Intelligence Support; (4) Selective Inquiry System; (5) Special Information System
SISOCS	Army Logistics/Maintenance Depot Data Network
SISR	SIGINT Security Regulation
SISS	(1) Survivable Intelligence Support to SlOP; (2) Subcommittee on Information Systems Security of the NSTISSC
SISUM	Sensitive Information Summary
SIT	Specialized Investigations Team
SITAS	Strategic Industrial Target Analysis Systems
SITDEV	Situation Development
SITMAP	Situation Map

SITREP	Situation Report
SITS	Secondary Imagery Transmission System
SITSUM	Situation Summary
SITTP	(US)STRATCOM Intelligence Tactics, Techniques, and Procedures for Strategic Operations
SIW	Strategic Intelligence Wing
SJA	Staff Judge Advocate
SJCS	Secretary, Joint Chiefs of Staff
SKCATL	South Korea Conventional Air Target List
SKE	Station-Keeping Equipment
SKYLINK	Communications System Provided by the Diplomatic Telecommunications System
SKYNET	United Kingdom Military Communications Satellite
SL	Sea Level
SLA	Special U.S. Liaison Advisor
SLAM	Standoff Land Attack Missile (Navy)
SLAR	Side-Looking Airborne Radar
SLAT	Surface-Launched Air-Targeted
SLBM	Submarine-Launched Ballistic Missile
SLC	Space Launch Complex
SLCM	(1) Submarine-Launched Cruise Missile; (2) Sea-Launched Cruise Missile
SLDCOM	Satellite Launch Dispenser Communications
SLED	Safe Low-Energy Detonators
SLEP	Service Life Extension Program
SLF	Super Low Frequency
SLFCS	Survivable Low Frequency Communications System
SLGR	Small Lightweight Global Positioning System Receiver
SLIP	Serial Line Interface Protocol
SLMM	U.S. Submarine-Launched Mobile Mine
SLO	Space Liaison Officer
SLOC	Sea Lines of Communication
SLOC(S)	Sea Line(s) of Communication
SLR	Side-Looking Radar
SLS	Space Launch Squadrons
SLSSM	Submerged-Launched Surface-to-Surface Missile
SLV	Space Launch Vehicle
SM	(1) Memorandum by the Secretary, JCS; (2) Statute Mile; (3) Service Member; (4) Security Monitor; (5) Smart Modules
SMAA	Submarine Movement Advisory Authority
S/MANCO	Space/Missile Analyst NCO
SMANCO	Space/Missile Analyst NCO
SMART-T	Secure Mobile Antijam Reliable Tactical Terminal
SMCC	Survivable Mobile Command Center
SMDPS	Strategic Mission Data Preparation System
SME	Subject Matter Expert

SMEB	Significant Military Exercise Brief
S/MEO	Space/Missile Event Office
SMG	Standard Mail Guard
SMIOC	Senior Military Intelligence Officers' Conference
SMLM	Soviet (FSU) Military Liaison Mission
SMM	(1) Spatial Model Matching; (2) Special Mission Mandatory Modification
SMO	(1) Support to Military Operations; (2) Senior METOC Officer; (3) Special Mission Optional Modification
SMOB	Strategic Missile Order of Battle
SMOTEC	Special Missions Operational Test and Evaluation Center
SMP	Soviet Military Power (the publication)
SMPAS	Space Mission Payload Assessment System
SMR	Sources, Methods, and Rationale
SMS	Stand-Alone Analysis Subsystems
SMTP	Single Mail Transfer Protocol
SMU	Secure Mobile Unit

Spec Nav	Special Navy Program
SPECAT	Special Category (Pneumatic Tube Message Precedence)
SPECBOATRON	Special Boat Squadron
SPECBOATUNIT	Special Boat Unit
Spectre	AC-130 H/U Gunship
SPECWAR	Special Warfare
SPETSNAZ	Soviet (FSU) Special Purpose Forces
SPF	(1) Special Purpose Forces; (2) Single Point of Failure
SPG	(1) Self-Propelled Gun; (2) Softcopy Products Group
SPIES	Special Insertion and Extraction System
SPIN	Space Intelligence Notes
SPINS	Special Instructions
SPINTCOM	Special Intelligence Communications (Network)
SPIREP	Spot Intelligence Report
SPIRES	Special Intelligence Reports
SPIRIT	Special Purpose Integrated Remote Intelligence Terminal
SPK	Single Point Key(ing)
SPO	Special Project Officer
SPOC	Space Operations Center
SPOD	Sea Ports of Debarkation

SPOE	Sea Ports of Embarkation
SPOT	Satellite Pour l'Observation de la Terre (French)
SPOTREP	Spot Report
SPP	Shared Production Program
SPR	Strategic Petroleum Reserve
SPRAA	Strategic Plans and Research Analysis Agency
SPS	Scratch Pad Store
SPS	Special PSYOP Study
SPSS	Secured Packet Switched Service
SPT	Support
SPTCONF	Support Confirmation
SPTD	Supported
SPTG	Supporting
SPTREQ	Support Request
SQ	(1) Square; (2) Squadron
SQD	Squad
SQDN	Squadron
SQL	(1) Standard Query Language; (2) Structured Query Language
SQN	Squadron
SR	(1) Special Reconnaissance; (2) Short Range; (3) Southern Region; (4) Senior
SRBM	Short-Range Ballistic Missile
SRF	SIGINT Readiness Facility
SRHIT	Small Radar-Homing Intercept Technology (BMD Missile)
SRIG	Surveillance, Reconnaissance, and Intelligence Group
SRIS	Surface Range Imaging System
SROC	Southern Region Operations Center
SRIG	Surveillance, Reconnaissance, and Intelligence Group
SRJOIC	Southern Region Joint Operations Intelligence Center
SRAM	U.S. Short-Range Attack Missile
SRAMII	U.S. Short-Range Attack Missile (XAGM-131A; formerly AASM)
SRAM-T	Short Range Attack Missile - Tactical
SRB	Senior Review Board
SRBM	Short-Range Ballistic Missile
SRC	Strategic Reconnaissance Center
SRCU	SINCGARS Remote Control Unit
SRD	(1) System Requirements Document; (2) Special Research Detachment (U.S. Army)
SRF	(1) Strategic Rocket Forces (USSR); (2) Strategic Reserve Forces; (3) Secure Reserve Force (U.S.); (4) Selected Reserve Force; (5) SIGINT Readiness Facility; (6) SPIRIT Remote Facility (TROJAN)
SRFTL	Secure Reserve Force Target List
SRI	Surveillance, Reconnaissance and Intelligence
SRIG	Surveillance/Reconnaissance Intelligence Group

SRINF	Short-Range, Intermediate-Range Nuclear Forces
SRJOIC	Southern Region Joint Operational Intelligence Center
SRMIS	Southern Region Maritime Intelligence Summary
SRO	Sensitive Reconnaissance Operations
SROE	Standing Rules of Engagement
SRP	(1) Sealift Readiness Program; (2) SIOP Reconnaissance Plan
SRR	(1) Survival, Recovery and Reconstitution; (2) Security Requirements Review
SRS	(1) Strategic Reconnaissance Squadron; (2) Software Requirements Specification
SRSG	Special Representative to the Secretary-General
SRT	(1) Strategic Relocatable Target; (2) Standard Remote Terminals
SRW	Strategic Reconnaissance Wing
SRWG	Standing Requirements Working Group
SS	Attack Submarine
SSA	(1) Security Supporting Assistance; (2) Diesel-Powered Auxiliary Submarine; (3) Special Support Activity; (4) SIGINT Support Activity; (5) Soviet (FSU) Strategic Aviation
SSAN	(1) Social Security Account Number; (2) Nuclear-Powered Auxiliary Submarine
SSB	(1) Ballistic Missile Submarine; (2) Standard Software Base; (3) Single Sideband
SSB	Ballistic Missile Submarine
SSBN	Nuclear-Powered Ballistic Missile Submarine
SSBSC	Single Sideband, Suppress Carrier
SSC	(1) Coastal Submarine; (2) Space Surveillance Center; (3) Surface Support Craft
SSCC	Special Security Communications Center
SSCI	Senate Select Committee on Intelligence
SSD	Strategic Studies Detachment
SSE	Special Security Element
SSES	Ships Signal Exploitation Space
SSF	(1) Software Support Facility; (2) Special Service Force
SSG	(1) Cruise Missile Attack Submarine; (2) Special Security Group
SSGN	Nuclear-Powered Cruise Missile Attack Submarine
SSI	(1) Specialty Skill Identifier; (2) Safety, Security and Intelligence
SSIXS	Submarine Satellite Information Exchange Subsystem
SSJ	Self-Screening Jamming
SSLP	Transport Submarine
SSLSM	Single-Source Logistics Support Manager
SSM	(1) Surface-to-Surface Missile; (2) Midget Submarine
SSM/I	Sensor System Microwave Imager
SSM/T	Sensor System Microwave/Temperature
SSMA	Spread Spectrum Multiple Access
SSME	Spread Spectrum Modulation Equipment

SSMO	SIGINT Support to Military Operations
SSMOB	Surface-to-Surface Missile Order of Battle
SSMP	Security System Management Plan
SSN	(1) Nuclear-Powered Attack Submarine; (2) Social Security Number; (3) Space Surveillance Network
SSO	(1) Special Security Office; (2) Special Security Office(r)
SSO-INT	Senior Staff Officer-Intelligence (Canadian)
SSP	(1) SIGINT Support Plan; (2) Scheduled Strike Program (NATO); (3) Single-Shot Probability of Damage; (4) Single-Source Processor; (5) SIOP Support Program
SSP-S	Single Source Processor-SIGINT
SSQ	Auxiliary Submarine, Communications
SSQN	Nuclear-Powered Auxiliary Submarine, Communications
SSR	(1) Radar Picket Submarine; (2) Secondary Surveillance Radar; (3) Special Security SSRS Representative SIGINT Surveillance and Reporting System
SSS	(1) Staff Summary Sheet; (2) Systems Science and Software; (3) System Support Segment; (4) Special Support Section
SSSP	Single-Source SIGINT Processor
SST	(1) Training Submarine; (2) System Specific Threat; (3) Supersonic Transport; (4) Single Subscriber Terminal; (5) Safe Secure Transport; (6) Strategic Support Team; (7) Space Support Team
SSTO	Single-Stage-To-Orbit
SSTS	Space Surveillance and Tracking System
SSUS	Spin-Stabilized Upper Stage
ST	(1) SEAL Team; (2) Strategic Task; (3) Short Tons
S&T	Scientific and Technical
S&TI	Scientific and Technical Intelligence
ST&E	Security Test and Evaluation
STA	Surveillance and Target Acquisition
STACCS	Standard Theater Army Command and Control System
STAMIS	Standard Army Management Information System
STAMP	SOUTHCOM Topographic Augmentation Program
STAMPS	Stand-Alone Message Processing System
STANAG	Standardization Agreement (NATO)
STANAVFORLANT	Standing Naval Force, Atlantic (NATO)
STAN-EVAL	Standardization and Evaluation
STANS	(1) Soviet Tactical Nuclear Study; (2) Space Target Analysis and Networking System
STAP	Science and Technology Advisory Panel
STAR	(1) Surface-to-Air Recovery; (2) System Threat Assessment Report
STARC	State Area Command
STARS	Surveillance, Target Acquisition & Reporting System
STAR-T	SHF Tri-Band Advanced Range Extension Tactical Terminal
START	Strategic Arms Reduction Talks/Treaty

STARTEX	Start Date of an Exercise
STASS	Submarine-Towed Array Surveillance System
STATDM	Statistical Time Division Multiplex
Static RI	Static Infrared Workstation
STATS	Strategic Target Analysis and Tracking System
STATSIONAR	USSR/Russian COMSAT System
STC	(1) Sensitivity Time Control; (2) Short Time Constant (ECCM); (3) SHAPE Technical Center
STCFE	Science and Technology Center Far East
STD	(1) SIGINT Technical Data; (2) Standard
STEL	Stanford Telecommunications
STEP	Standardized Technical Entry Point
STEPS	Scientific and Technical ELINT Processing System
STEPS II	Scientific and Technical ELINT Processing System II
STG	Special Tactical Group
STEL	Secure Telephone
S&TI	Scientific and Technical Intelligence
STIC	(1) Scientific and Technical Intelligence Committee; (2) Scientific and Technical Intelligence Center
STICS	Scalable Transportable Intelligence Communications System
STIFF	Strategic Intelligence Forecast File
STIISP	Scientific and Technical Intelligence Information Services Program
STINT	Science and Technology (S&T) Intelligence
STIR	Scientific and Technical Intelligence Register
STITEUR	Scientific and Technical Information Team, Europe
STK	(1) Satellite Took Kit; (2) Strike
STO	Science and Technology Objectives
STOL	Short Takeoff and Landing
STON	Short Ton
STOPS	Stand-Off Optical System
STOVL	Short Takeoff, Vertical Landing
STP	(1) Space Test Program; (2) Site Transition Plan
Str	Strength
STRAM	Static Random Access Memory
STRAT	Strategic
STRATCOM	Strategic Command
STRATJIC	USSTRATCOM Joint Intelligence Center
STRATLAT	Strategic Command Liaison Assistance Team
STRATMAS	Strategic Message Analysis Server
STRATPAT	Strategic Planning and Analysis Tool
STRED	Standard-Tactical Receive Equipment Display STRICOM Simulations, Training, and Instrumentation Command
STRIKFORSOUTH	Strike Force South
S-TRED	Standard Tactical Receive Equipment Display
STRUM	Standard Technical Reporting Using Modules

STS	(1) Special Training Standard; (2) Special Tactics Squadron; (3) Subcommittee on Telecommunications Security of the NSTISSC
STT	(1) Small Tactical Terminal; (2) Special Tactics Teams; (3) Shore Targeting Terminal
STU	Secure Telephone Unit (STU II & III)
STU-III	Secure Telephone Unit III
STUR	Secure Telephone Unit/Remote
STVD	Southern Theater of Military Operations (FSU)
STW	Strike Warfare
STWC	Strike Warfare Commander
STX	Situational Training Exercise
SUAWACS	Soviet (FSU) AWACS
SUBACS	Submarine Advanced Combat System
SUBLANT	Submarine Forces, Atlantic
SUBOPAUTH	Submarine Operating Authority
SUBORD	Subordinate
SUBPAC	Submarine Forces, Pacific
SUCCESS	Secure UHF Computer Controlled Equipment Subsystems
SUG	SAFE Users Group
SUM	(1) Surface-to-Underwater Missile; (2) Structural Usage Monitor
SUMS	Structural Usage Monitor System
SUPCOM	Support Command
SUPINTREP	Supplementary Intelligence Report
SUPIR	(1) Supplemental Photographic Interpretation Report; (2) Supplemental Phase Interpretation Report
SUPNAVFOR	Supporting Naval Force
SUPPLOT	Supplemental Plot
SUPREMS	Supplemental Preliminary Mission Summary
SUPT	Superintendent
SURAN	Southeastern Universities
SURFSHIP	Surface Ship
SURFWARDEVGRU	Surface Warfare Development Group
SURTASS	Surveillance Towed Array Sonar System (U.S.)
SURV	Surveillance
SUSLAK	Special U.S. Liaison Activity Korea
SUSLO	Special U.S. Liaison Officer
SV	(1) Secure Voice; (2) Special View
SVC	Service
SVCN	Secure Voice Conferencing Network
SVD	Soviet Sniper Rifle
SVGA	Super Video Graphics Adapter
SVIP	Secure Voice Improvement Program
SVOD	Soviet Aircraft Navigation and Landing System
SVS	Secure Voice System
SVTC	Secure Voice Teleconferencing

SVTS	Secure Video Teleconferencing System
SW	(1) Short Wave; (2) Surface Warfare; (3) Software; (4) Strategic Wing
S&W	Surveillance and Warning
SWA	(1) Southwest Asia; (2) Southwest Africa; (3) Standoff Weapons Assembly; (4) Senior Warning Analyst; (5) Senior Weather Analyst; (6) Secure Work Area
SWADII	Southwest Asia Defense Information Infrastructure
SWAL	Shallow-Water Attack Craft, Light
SWAM	Shallow-Water Attack Craft, Medium
SWAT	SOCRATES WS/LAN Analysis Testbed
SWB	Southwest Border
SWC	(1) Special Warfare Center (U.S. Army); (2) Special Warfare Craft; (3) Strategic Warfare Center; (4) Strategic Warning Center; (5) Space Warfare Center
S&WC	Surveillance and Warning Center/Control
SWCL	Special Warfare Craft, Light
SWCM	Special Warfare Craft, Medium
SWCS	Special Warfare Center and School
SWE	Sweden
SWHQ	Static War Headquarters
SWI	Special Weather Intelligence
SWIR	Short Wave Infrared
SWIRTERCAT	SWIR Terrain Categorization
SWIS	Survivable Wartime Intelligence System
SWO	(1) Special Weapons Officer; (2) Staff Weather Officer; (3) Senior Watch Officer
SWORD	Submarine Warfare Operations Research Department
SWP	Standing Warning Program
SWPS	Space & Weapons Systems SIGINT Working Group
SWR	Southwest Region
SWRS	Slow-Walker Reporting System
SWSC	Space Warning Systems Center
SWTMO	SW Theater of Military Operations
SYBASE	A Collection Requirements Database
SYDET	Sympathetic Detonator
SYDP	Six-Year Defense Plan
SYG	Secretary General
SYNCOM	Synchronous Communications Satellite
SYRACUSE	Systeme de Radio Communication Utilisant un Satellite
SYRUP	System Resource Utilization Package

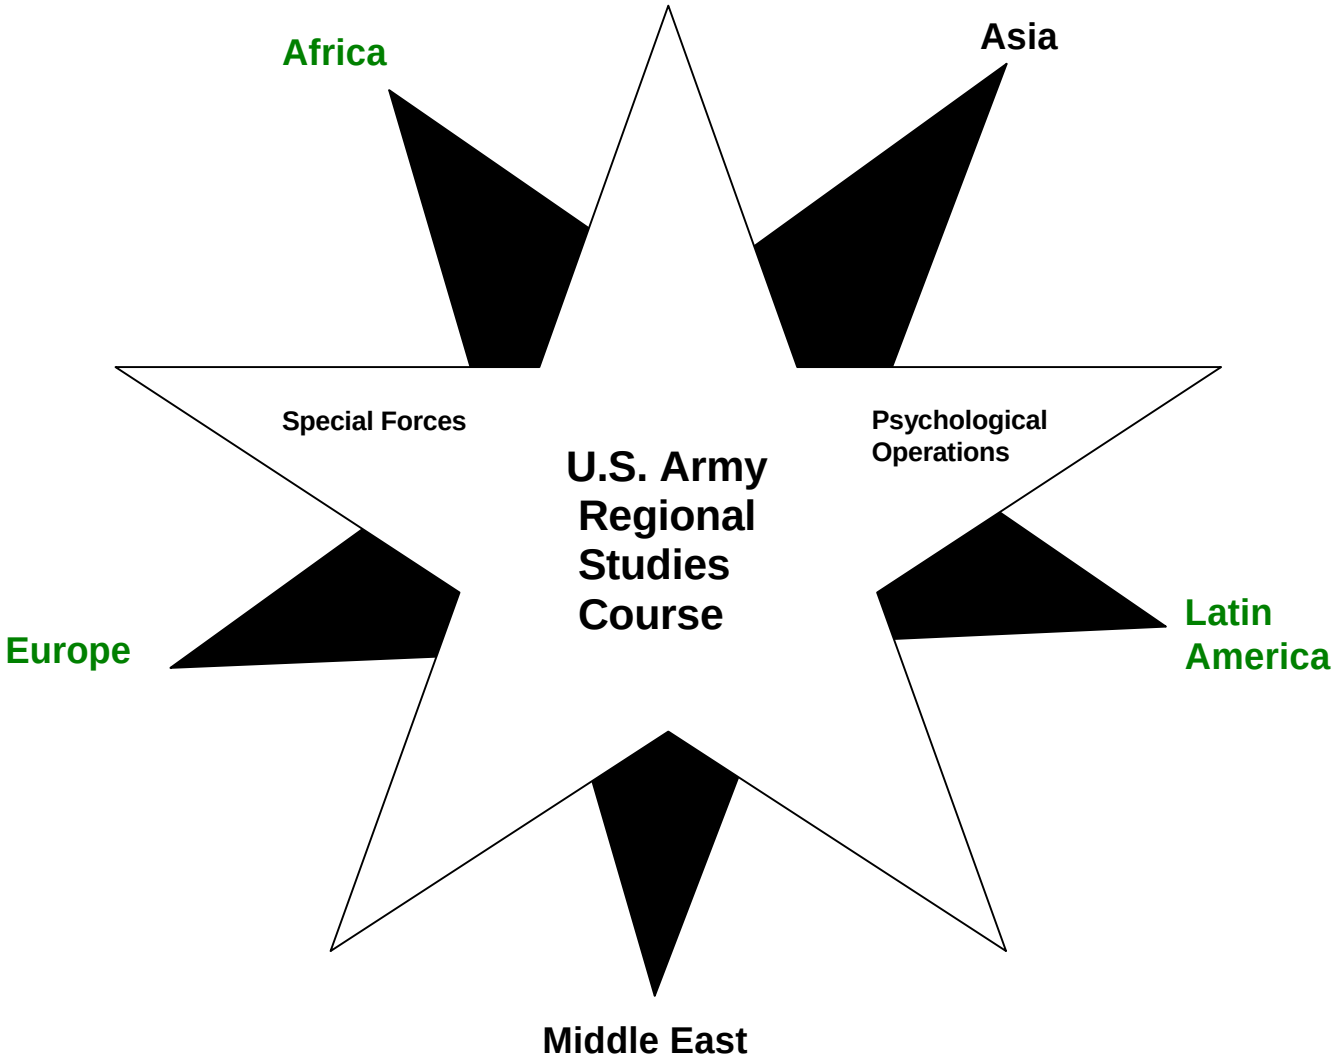
Political Military Analysis Handbook



United States Army John F. Kennedy Special Warfare Center and School

Fort Bragg, North Carolina 28310
2004

FOREWORD

This handbook has been prepared by the faculty (appendix 1) of the “Regional Studies Course” (RSC) to support a program of study that prepares Army officers for Civil Affairs and Psychological Operations assignments abroad. In the course, students survey five world “regions” -- Africa, Asia, Europe, Latin America, and the Middle East -- and study one of them in some depth. The faculty uses the sixteen discrete “Political-Military Factors” discussed herein as common reference points for teaching the course's five regionally focused seminars. More important, they are introduced to the students as a reliable framework for analysis that, when applied judiciously, will lead to a sophisticated understanding of the dynamics within the foreign country or region of their assignment. Furthermore, the framework provides the start point for specific analyses of associated operational issues, questions, and problems. The theories, concepts, and insights developed in-conjunction with these sixteen factors are drawn from broadly accepted scholarship; but they are selected, organized, and presented to support the course's practical goal of preparing officers for challenging Civil Affairs and Psychological Operations assignments abroad.

We welcome your comments, ideas, and critiques. Address them to: Regional Studies Course Attn: Seminar Director, P.O. Box 74145, Ft. Bragg, NC . 28307.

INTRODUCTION

As a Civil Affairs or Psychological Operations officer conducting or planning for operations in foreign environments you will need a solid grasp of the military, political, and sociological dynamics at work within the “Area of Operation." Experience shows that developing a sophisticated understanding of the operational environment in another country or region is a very complex endeavor. Success requires a deliberate analytical approach using a well-vetted framework and solid methodology.

By analytical approach, or analysis, we mean the study of the whole by dividing it into discrete parts, examining the nature of each part, and determining how they function in relation to each other and the whole. The objective is not merely a multi-faceted description of a certain phenomenon, physical or social, but an **explanation** of how those facets relate to each other and create the whole. For example, we cannot explain how a Swiss watch works simply by disassembling it and describing the various parts. We must also determine how those parts fit and operate in conjunction with each other.

The "Pol-Mil" Factors

The sixteen Political-Military factors discussed in this handbook provide a carefully constructed framework for use in analyzing an operational environment. Each factor addresses an important aspect of that environment, nominally assumed to be that of a foreign country. When used collectively, and in conjunction with the research methodology reviewed in chapter 1, these factors will develop a comprehensive base of knowledge about the country or region of interest. When assessed in conjunction with each other, they form the start point for multi-discipline analyses of the issues and questions that are associated with Civil Affairs or Psychological Operations activity abroad. You will exercise with these factors in the Regional Studies Course with the intent that you apply them in your assignments after graduation.

The sixteen factors presented here have been selected to ensure that all the “parts” or dimensions of complex foreign environments are captured and brought under examination. While this specific list, or framework, is somewhat arbitrary, we consider it a comprehensive one that incorporates insights from a range of academic disciplines to ensure the development of a fully dimensioned understanding of the operational environment. Recently we have added “Media” and “Technology” to the mix of factors as their impact on operations abroad has clearly increased in the age of “globalization.”

How to Use the Handbook

Each chapter is devoted to an individual "factor" or dimension of a country or region. The chapters begin by defining important terms and introducing academic approaches that have been developed to help interpret data and explain events within the domain of that factor. The aim is to provide important fixed markers that are commonly used when examining the area under study through that chapter's particular domain or lens and, at the same time, alert you to the often broad scope of thought and approach within it. For

example, while "history" is succinctly defined early on in Chapter I, the review of literature that follows illuminates the multitude of approaches and perceptions that lurk just under the surface of the definition. The chapters then turn to a practical distillation of approaches, concepts, cautions, and questions. You should use these as guides to help you with the task of sorting through the voluminous available data and opinion relevant to the factor, or aspect, of the area under study. [1] This task, the selection and evaluation of data is the crucial start point for all analyses.

Understanding how each of these factors or dimensions are reflected or manifested in the area you are studying is, in most cases, just the first step in your analysis. Just as the mainspring and gears of a watch do not operate in isolation from each other, neither do the various discrete factors taken up by the chapters in this handbook. For instance, Chapter 13 alerts you to the fact that ethnicity can have its "roots" in other factors, such as religion or culture; and Chapter 5 warns that, "the study of economics cannot be divorced from the political context." Determining how such interrelationships function in the country under study puts a premium on reflection and breadth of thought, and the final section of each chapter is written to help you begin this process.

This leads to a third aspect of the analytical process supported by this handbook. Generally, your analyses will be undertaken in response to an identified issue, problem, or question. The analytical task may be broad or narrow -- for instance, "how does it work?" versus "does it need a new mainspring?" in the case of Swiss watches -- but it will call for explanation or prediction, as opposed to mere description. The issues and questions arising in your Civil Affairs and Psychological Operations assignments will be diverse, for example: "What type of civil affairs projects can make a difference in Ethiopia?" "How might current socio-political dynamics in Venezuela affect U.S. political-military operations, such as disaster relief, there?" "What propaganda themes will advance peacemaking/peacekeeping efforts in the Balkans?"

To answer such questions with confidence you must determine how each of the Pol-Mil factors might affect the particular issue or question being addressed. That effect is issue dependent, and its impact on your analysis can, and often does, vary from country to country and issue to issue. This then is really the heart your analysis -- assessing how each of these factors acts on the issue in question and then drawing the appropriate conclusions. In so doing, do not discount any of the factors *a priori*. You need to understand and consider all of them and then, if you conclude that several are not relevant to your conclusion, explain why.

---

[1] Apart from their role in developing a comprehensive assessment to the area, some of these concepts can also be used in a more discrete fashion For example, given a well developed democracy, the "median voter theorem" might be helpful in assessing the likelihood of country "x," perhaps Finland, adopting a particular policy, such as whether or not to join NATO.

In summary, use these sixteen factors as a framework for beginning analyses that address operational and planning issues in foreign environments. Determine how each is manifested in that area and how each influences the other there. Then assess those insights against the specific issue or question at hand. The result will be solidly grounded conclusions that you can use with confidence.

Research Methods

I. Introduction:

This chapter includes the methods used to conduct social science research. It provides guidance in principle rather than instructions in detail. Therefore, it starts with an overview of how social science research uses ideas and facts to generate knowledge. Then, it moves to a brief description of the standards of scholarly research. This is followed by an examination of how theories and data are used in social science research. The chapter ends with sections on how to structure a research paper and how to attribute and document sources.

Important concepts are introduced and defined throughout the chapter. However, it will be useful to define the following key terms from the start[1]:

Method: the systematic application of reasoning to the analysis of data.

Analysis: "1. The breaking up of any whole into its parts so as to find out their nature, proportion, function, relationship etc." (*Webster's Deluxe Unabridged Dictionary*, 2d ed.).

Theory: A set of ideas that explain observed phenomena in terms of underlying relationships to other phenomena.

Data: Qualitative and quantitative observations of the world.

Empirical: Having to do with the analysis of data

II. Overview: Combining Ideas and Facts

The aim of scholarly research is to increase our knowledge about the world. But what is knowledge? Is it simply the sum total of factual information we have about the world? Astrologers have very detailed information about the movement of planets and stars but they ask questions and find answers that are very different from those of astronomers. This is largely because astrologers have a different understanding of how observable events (or phenomena) are related to each other than astronomers do. Given the same information, astronomers and astrologers will claim to know entirely different things about the world.

Therefore, one can define knowledge as a body of facts, and ideas that interpret and explain them. The importance of this definition is that it points to two approaches to gaining knowledge. Theoretical research focuses on ideas about how the world works and empirical research focuses on observing the world as it works. Though individual projects may be purely theoretical or empirical, social science research as a whole depends on the interaction of theoretical and empirical research to expand our knowledge of the world.

[1] With the exception of the definition of analysis, these definitions have been derived from common usage in social science. See Johnson and Joslyn (1995) for a more detailed discussion of these terms.

The methods of social science research emphasize the use of both theory and data (ideas and facts). Theories explain how two or more general classes of phenomena (e.g., income inequality and political violence) are related. In most empirical research, data is collected to test the generalizations that theories produce. Theories that survive the testing process (i.e., "hold water") are used to explain particular events or to predict the outcome of future events. Table 1-1 illustrates the role ideas and facts play throughout the research process.

Table 1-1: Interplay of Ideas and Facts

Ideas :		**Facts:**
		Observations suggest topic (or preliminary answer to question)
Other people's work suggests how to break topic down.		Further observation along with others' ideas refines understanding of topic.
Develop specific research goal.		
Look for and develop theoretical framework within which to consider facts.		
Use conceptual framework to generate new propositions about the world.	*AND/OR*	Collect and analyze data to test propositions about the world, OR Use theoretical framework to analyze the world.
Interpret results and draw conclusions		

III. Standards of Scholarly Research in International Relations (IR)

There are several substantive standards for research in social science in general, and IR in particular. Though they are often labeled and categorized in different ways, the following list captures the main criteria:

Interest: The research topic should be positive, significant, and general. A positive topic is non-normative and deals with the world as it is, not as it should be. A significant topic is not trivial and does not leave the reader asking "So what?" Research should also focus on events or classes of events that are likely to occur again and thus are general in nature.

Originality: Research should extend the existing body of knowledge. This can be done by adding new theories or data, by refining existing theories or data, and/or combining existing theories and data in new ways. It is incumbent on researchers to review the literature on their topic to ensure that they are not "reinventing the wheel".

Cumulation: Though it should be original, research should also build on existing theoretical and empirical research. Researchers are expected to use the information and ideas of previous researchers as a foundation for their research. In doing so, researchers must be candid and critical about what they take from others. That is researchers must properly attribute the

sources of their ideas and data to ensure there is no doubt which ideas are original and which are not. They must also scrutinize the ideas and cross-examine the information they use to ensure that the foundation of their research is solid.

Method: Research must have a discernible methodology that is appropriate, transparent, and persuasive. There are many different methodological approaches from which a researcher may chose. The choice of an appropriate methodology is often governed by the topic and the existing literature on the topic. Whatever methodology is chosen, it must be transparent to the reader how the research is conducted. That is, it must be apparent to the reader how each step of the research was conducted. This standard is that readers should be able to reproduce the research themselves (thus this standard is often described as reproducibility). Finally, the research must be persuasive in that it must support the conclusions of the researcher's analysis and there must have been the possibility that the research could have pointed to a different conclusion.

Results: Though the results may be qualified or ambiguous, research is not done until it comes to a conclusion. From the beginning of the research, it should be clear what the research is trying to explain, or what question it is seeking to answer. At the end of the research, the researcher should be straightforward about presenting the explanation or answer produced by the research.

IV. Using Theories

Theories explain observed events in terms of unobserved relationships to other phenomena. The events that theories explain are called dependent variables and the phenomena that are used to explain the dependent variable are called independent variables. Theories tell stories about how independent variables affect dependent variables. They also make predictions, called hypotheses, about what will happen to the dependent variable given different values of the independent variable.

Theories are very useful for analyzing particular events because they suggest likely cause and effect relationships. In so doing, they point out what data is important and what data is not. This filtering function simplifies the data collection task and prevents the researcher from being overwhelmed by data. Theories not only tell the researcher what data to collect but also what different the data mean. Thus, by providing a framework for interpreting the data, theories also simplify the analysis task.

One might object that, by driving the collection and interpretation of data, theories bias and limit the analysis. To a certain extent they do, but, as a practical matter, researchers must limit the data they collect and analyze. Whatever bias a theory may impart on the research, it is preferred to the bias that results from basing research on ad hoc explanations, or on the data that happen to be the most readily available. However, researchers must examine the "track record" of the theoretical perspective they select and be aware of the limitations it imposes on their analysis. For this reason, researchers usually employ more than one theoretical perspective when interpreting an event.

Finding Theories: Choosing a theoretical perspective or perspectives upon which to

base one's research is perhaps the most important part of the research. The selection and development of a conceptual framework of analysis is also the most intellectually challenging task a researcher faces. For this reason many students try to bypass this step and go straight to analyzing data. Unfortunately, in not making a choice, they have chosen to develop ad hoc explanations based on unsystematically collected data. This is an approach that is acceptable in journalism but not in social science.

Therefore, once a topic is assigned or selected, research must begin with a survey of the literature to identify the relevant theoretical perspectives. The Pol-Mil Factors Handbook presents theoretical perspectives on many different topics, and thus, it is a natural starting point. Students should also conduct a search of the scholarly literature on their specific topic to identify additional theoretical perspectives. Students should search academic journals, libraries and publishers for the latest scholarly articles and books on their topic. The emphasis here is on scholarly works because these will have more developed theoretical frameworks, as well as discussions of and references to the larger literature on the topic.

Using Theories: Once the various theoretical perspectives have been identified, the researcher must choose which one or ones to use. The researcher may choose to refine a theory, combine it with others, or develop a new theory. The choice is generally governed by the theory's record at producing results and its applicability to the exact question the researcher is interested in answering. Most importantly, the theory's dependent variable must be the same as that of the researcher. If the researcher is trying to predict how a war will end (the researcher's dependent variable), then theories that explain when wars start (the theories' dependent variable) are not applicable.

The goal is to create a conceptual framework that defines key concepts and specifies cause and effect relationships between them. Concepts are general characteristics or aspects of events under study. For instance one might describe events in Chechnya as a war, an ethnic conflict, a rebellion or a counterinsurgency. Each of these descriptions is a concept that needs to be explicitly defined before its relevance to the particular events can be examined. A good theory about the cause of ethnic conflicts will provide a clear definition of ethnic conflicts and well as of the causes. It can not be overemphasized that it must be clear what aspect of the event the researcher is trying to explain (the dependent variable), and what aspects of the event the researchers is using to explain it (the independent variables).

IV. Using Data

Once the conceptual framework has been established, the researcher is ready to engage the data. This part of the process is more concrete and systematic, but also more tedious and frustrating. The researcher must identify, find, evaluate, and analyze the data. Each of these steps is described below.

Identifying Data: The researcher must determine what data to collect to measure each of the key concepts in the conceptual framework. If the conceptual framework is well thought out, then it will be a fairly straightforward task to identify the ideal types of data. Of course, the ideal data are rarely available, but the researcher must start out with a good idea about what the best data would be in order to identify what the next best data are.

Finding Data: Given time and resource constraints, most student researchers use existing data, as opposed to conducting primary research to collect new data. Research libraries, such as UNC Chapel Hill's Davis Library, are some of the most valuable sources of data available. They either contain or have electronic access to an overwhelming supply of data. More importantly, they have a staff of reference librarians who are professionals at connecting researchers with information.

Unfortunately, students often attempt to collect all their information off the Internet. While the Internet is an invaluable research tool, the websites on it are a problematic source of information. Most high quality texts, articles and data are copyrighted, and are not available to the general public over the Internet. The best sources of information on the Internet usually require some kind of subscription or access fee.

Fortunately, libraries have started buying access to these services for their patrons. Many universities offer its full and part-time students remote access to a number of on-line subscriptions such as InfoSeek and EBSCO host. North Carolina Public Libraries offer cardholders access to a wide range of subscription services in a service called NC Live. A description of these services can be found at <http://www.nclive.org/>. UNC Chapel Hill cardholders have access to NC Live and a number of other services described on their website at <http://www.lib.unc.edu/>. NC Live and most of UNC Chapel Hill's services require the researcher to physically be in the library.

Evaluating Data: Researchers have a responsibility to critically evaluate the origin and quality of the information they use. This task has been greatly complicated by the explosion of information available on the Internet. The low cost and relative anonymity of web publishing allows not only for a diversity of ideas and viewpoints but also for a great deal of dubious or false information, and outright propaganda. Because web publications have typically not been through a review process, researchers must be much more critical of web publications than of traditional publications.

Generally, researchers must evaluate both the sources and content of their data. To evaluate the data's source, the researcher must identify the author of the data and how the author originally acquired the data. The researcher must also critically examine the reliability and objectivity of both the original author and the original author's data. Researchers are free to use data from biased or unreliable sources, as long as they acknowledge and describe the bias or unreliability, and qualify their analysis to account for the imperfections of the data.

When evaluating the content of sources, one of the biggest problems researchers face is sorting out propaganda from scholarship. Bodi (1995) lists the following indicators of propaganda and scholarship that students and researchers can use to evaluate both print and web publications:

Indicators of Scholarship:	Indicators of Propaganda:
Describes limits of data	Excessive claims of certainty
Presents accurate description of alternate views	Personal attacks or ridicule
Presents data that both does and does not Support favored views	Emotional appeals Distortion of data that doesn't support favored

Encourages debate, discussion, and criticism
Settles disputes with generally accepted Methods for analyzing data.
Looks for counter examples
Uses language in conventional ways
Updates information
Admits own ignorance
Attempts to discuss general laws and Principles
Finds fault and admits difficulties in own field
Relies on logic and critical thinking skills

view
Suppresses contradictory views
Suppresses contradictory facts
Appeals to popular prejudices
Relies on suggestion, innuendo
Devalues thought and critical appraisal
Transforms words to suit aims
Magnifies problems and minimizes problems with suggested remedies
Presents information and views out of context

Analyzing Data: Once the data has been evaluated in terms of itself, it must be analyzed in terms of the overall research question. If the data is qualitative in nature, then the researcher must subjectively appraise the data and use logic to derive conclusions. As stated before, the theoretical perspective adopted provides an invaluable starting point for logical arguments. A detailed discussion of how to construct logical arguments is beyond the scope of this chapter. However, useful discussion of using logic can be found at Purdue University's Online Writing Laboratory at http://owl.english.purdue.edu/Files/123.html .

Statistical methods are usually used to analyze quantitative methods. Again a detailed discussion of these methods is beyond the scope of this chapter. However, Johnson and Joslyn (1995) provide a thorough introduction to the range of statistical methods used in political science research. In addition, Middleton (1997) provides detailed instructions on using Microsoft Excel to conduct statistical analysis.

V. The Research Report:

The structure of the report, usually a paper, is a thing apart from the structure of the research. That is, the sequence of the paper does not follow the sequence of the research. While you can, and should, write large parts of the paper as you conduct the research, you must write the paper as a report of your results, not as narrative of your research. The main difference between the sequence of the research and the paper is that research will end up pointing to one fundamental conclusion while your paper must start and end with that conclusion.

Introduction: In terms of presentation, this section is the most important. It orients your reader to your question, methodology and subsequent conclusions. You want to lay out your paper for your reader by explaining what you're doing, and how you are doing it. It is essential that the writer and reader know where the paper is going from beginning to end. Generally, one should be able to read the first and last paragraphs of a paper (or the first and last pages of a thesis) and have it make sense. To that end, the introduction as a whole should answer the following questions:

What is the question, hypothesis or story you are telling? By the end of the first paragraph, the reader should know what your paper is about. You need to be very clear exactly what it is you are trying to explain or understand. In technical terms, what is your dependent variable?

What is the state of the art on this subject? Describe the literature as a whole paying particular attention to seminal works and the most recent works. If there is more than one school of thought on your subject, then describe the debate. Your purpose is to point out what has been done and what has been left undone. It may be that no one has looked at your particular problem or you think there is a shortcoming in their approach. Your review of the literature should lead into the answer to the next question.

What are you going to do to improve on the literature? Having pointed out the shortcomings of the literature, you must now show how you're going to - at least partially - correct them. Explain your methodology and how it improves on existing works. The reader should have a good idea of what it is you are going to do.

Where are you going from here? Your introduction should always end with a road map of the remaining paper or thesis. Explain the structure of your paper/thesis and the logic behind it.

Where will it end? You should always give a sense of what your conclusions will be. You are not trying to surprise your reader.

Methodology/Theory: It may be that your methodology or theory is particularly involved and requires a detailed explanation. If so you should briefly describe your methodology in the introduction and go into detail in a separate section.

Substantive Sections: Here you do the work. It is important that as you present information, you also analyze it. Never assume that a quote, a fact, a graph or figure speak for themselves. Always explain the significance of the data and the implications of the analysis for the overall point you are making. Don't wait until the paper's conclusion to point out the major points.

Conclusions: There should be nothing new in the conclusions. The reader should be convinced by now. If, when writing the conclusion, you see a new argument for or against your point, you need to go back and put that in the body. What you are doing here is summing up what you've found and suggesting broader implications of your findings.

Reference List: All papers require a reference list or bibliography. One should list only works that have been cited in the paper/thesis. There is a school of thought that advocates a "Reference List" of works cited and a "Bibliography" of a wider list of relevant works. However, if the work is so relevant, it should have been cited; or, if it isn't worth citing, it's not relevant enough to be listed. If there are interesting works on tangential subjects, it's better to comment on them in footnotes.

VI. Attribution and Documentation

The fundamental principle of academic integrity is simple. Ensure that there is no doubt about the origin of all the ideas and information in your work. Earnest adherence to this principle is far more important than adherence to any particular format. For this reason, the principles of attribution and documentation are discussed before going into details of format.

Attribution: It is a matter of academic integrity that scholars not take credit for the words or ideas of other scholars. At the same time, it is imperative for the cumulative growth of knowledge that scholars use the ideas and words of others scholars. Indeed, the value of a scholar's work is often measured by how often it is cited by others. Therefore, all scholars must learn to honestly use and properly attribute the ideas and words of others.

When you use someone's ideas or words, there are two things you must do. First, make it clear to what extent you are using them and, second, give the original author credit. The dual nature of the standard is most easily seen in the case of using another person's words. In such a case, the other person's words are separated from one's your own by quotes or double indentations, thus satisfying the clarity requirement. Then a citation is attached to it (as discussed below) to give appropriate credit.

When using someone's ideas, it is generally necessary, and preferable, to paraphrase and reinterpret the original author's words. Authors are expected to summarize, interpret and criticize the ideas of others, not to "cut and paste" their words. Therefore, lengthy direct quotations are discouraged. Instead authors are expected to write their narrative so that it is apparent to the reader where the other authors' ideas begin and end. Thus, though there are several specific formats for crediting authors, being clear about how you have used another's ideas is a very subjective matter which calls for good judgment on your part.

Documentation: As discussed before, research must be transparent and reproducible in order to be considered scientific. Therefore, it is important that all data presented as fact is from verifiable sources, and that sufficient information is provided to allow the reader verify those sources. This is not as much an issue of integrity as it is of competence. To this end, citations are used for data from documented sources and appendices for data from undocumented or inaccessible sources (e.g., results from a survey conducted by the author).

It must be added that documentation is not authoritative. That is to say that when you document a fact, you are not showing that it is correct. Rather you are showing that you did not make it up or misinterpret it to support your conclusion. Furthermore, ideas, as opposed to empirical observations, cannot be presented as fact. Therefore, if Henry Kissinger is quoted as saying that anti-war protests had no effect on policy in Vietnam, documenting the quote only allows someone to verify whether or not he said it. Documentation does not establish whether or not he was right. It is very important to avoid the temptation to prove by citation.

Styles of Attribution and Documentation: There are several formats, usually referred to as styles, for citing other people's work. Almost every professional association and journal will have its own particular style. The style presented below comes from the *Chicago Manual of Style* (1993; hereafter referred to as *CMS*) which contains extremely detailed guidance on writing and editing. While *CMS* is one of the most commonly used style manuals, it is far from alone in the field. *The MLA Style Manual* (Achtert, and Gibaldi 1985) is commonly used in the humanities, *Publication Manual of the American Psychological Association* (1994) is often used in social and behavioral sciences, and Turabian (1987) publishes a guide to writing papers, theses and dissertations which is very popular among students. While all of the styles presented in these manuals will satisfy the requirements of attribution and documentation, it is important that a writer chooses one and consistently uses it.

There are two basic styles of citation, the documentary-note system and author-date system (*CMS* 1993 15.2). The note system uses footnotes or endnotes to indicate the source of whatever is being documented. This system is popular in the humanities because it involves the least intrusion on the text. The author-date system uses in-text references, which consist of the author or authors' last name(s) and the year in which the work was published, and a reference lists with full bibliographic information. Since social scientists use citations more often for attribution than documentation, this system is favored in the social sciences because it gets the cited author's name into the text.[2] For this reason, and because the author-date system is so easy to use, I will concentrate on the use of this system.

As already mentioned, the author-date system has two components, the in-text reference and the reference list. In the next two sections, I explain how to list the full bibliographic information in the reference list and, then, how to use in-text references. For clarity, entries in the reference list will be referred to as references and in-text references will be referred to as citations. Therefore, citing an author's work will involve using a citation and a reference.

References: References provide the readers with the information they need to locate and acquire the works you cite. Therefore, it is important that the information given be accurate and complete. In the author-date system, references are associated with the citations made in the text. Therefore, given a citation, it must be easy for the readers to find that particular reference in the reference list. These then are the two standards for references, completeness of information and ease of use.

It is easier to meet both of these standards if you write complete references for works when you first get them and build your reference list before you write your paper. Attempting to put the reference in its final form alerts you up front to any possible questions about how the information should be listed. This is a question that is much easier to resolve when you have the book in hand and the time to consult a style manual. Also, if the reference list is written and in hand, it will be easier to correctly cite works as you write.

Books: Here is the basic format for a book reference and three examples showing how multiple authors are listed.

Author's Last Name, First Name Middle Initial. Date. *Title in Italics.* City of Publication: Publisher.

Bueno de Mesquita, Bruce. 1981. *War Trap*. New Haven, CT: Yale University Press.

Bueno de Mesquita, Bruce and David Lalman. 1992. *War and Reason*. New Haven, CT: Yale University Press.

Bueno de Mesquita, Bruce, David Newman, Alvin Rabushka. 1985. *Forecasting Political Events.* New Haven, CT: Yale University Press.

---

[2]This is not to say that only the author-date is used in social science. There is some social science journals (e.g., *International Organization)* that use the documentary-note system.

Journal Articles: Academic journals are usually published, paginated and shelved in yearly volumes. Therefore, it is usually sufficient to know the volume and page number of an article to find it. Accordingly, the volume and page numbers are the meat of the reference.

Author's Last Name, First Name Middle Initial. Date. "Title of Article." *Title of Journal.* Volume Number (Issue Number): Starting page – Final Page Number.

Grieco, Joseph M. 1988a. "Anarchy and the Limits of Cooperation." *International Organization*.42:485-508.

Chapter in a multi-author (edited) collection: A great many academic books are collections of works written by various authors. If you wish to refer to the entire volume, then the reference is done in the following manner:

Editors Last Name, First Name Middle Initial, ed. Date. *Title of Collection.* City of Publication: Publisher.

Midlarsky, Manus I, ed.. 1997. *Inequality, Democracy, and Economic Development.* New York: Cambridge University Press.

However, if you wish to refer to a chapter of the collection, then the chapter gets its own reference emphasizing the author of the chapter and not the editor of the collection. This is done even if the author of the chapter happens to also be the editor of the collection. This type of reference is done in the following manner:

Author of Chapter's Last Name, First Name Middle Initial. Date. "Title of Chapter." In *Title of Collection,* ed. Editor's First Name Middle Initial Last Name. City of Publication: Publisher.

Muller, Edward N. 1996. "Economic Determinants of Democracy." In *Inequality, Democracy, and Economic Development,* ed. Manus I. Midlarsky. New York: Cambridge University Press.

Midlarsky, Manus I. 1996. "Introduction." In *Inequality, Democracy, and Economic Development,* ed. Manus I. Midlarsky. New York: Cambridge University Press.

Theses or Dissertations: Universities keep copies of master's thesis and Ph.D. dissertations somewhere in their library systems. To reference one, it is sufficient to indicate the type of work and the university to which it belongs in the following manner:

Author's Last Name, First Name Middle Initial. Date. "Title." Ph.D. diss. (Or Masters Thesis.) Name of University.

Lynch, John M. 1998. "Algeria, Iran and Turkey: A Model of Secular Versus Religious Nationalism." Master's Thesis. Troy State University at Ft. Bragg.

Electronic Sources*:* The most important thing to remember when citing information

received from the web is that you are citing the content and not the site. Therefore, you need to include the information you would normally include in a citation and reference, plus the information about where and when it was retrieved from the web. Most importantly, as with all citation, you must cite the author not the work. This is both more difficult and more important on the Internet since authorship of websites is often obscured and obscured authorship is often a sign of questionable content.

As in other forms of citation, there are differing styles. However, the International Standards Organization's format is gaining widespread acceptance. Full description of this format can be found at http://www.nlc-bnc.ca/iso/tc46sc9/standard/690-2e.htm . An adapted form of the basic format is as follows:

Author. Date of Publication. Title of Content. Secondary Responsibility. [Type of Medium]. Place of Publication: Publisher. [Date of Citation]. Availability and access. Standard number.

Examples: Each of these example deviates from the basic format in some way based on the type of online document and the available information.

Bureau of Public Debt. 1999. "Historical Public Debt Outstanding – Annual 1950 - 1999." *The Public Debt Online* [online]. Washington: Department of the Treasury. Available on the WWW at <http://www.publicdebt.treas.gov/opd/opdhisto4.htm>.

CNNfn. 2000. "China-Taiwan WTO Link." February 15 [online][accessed on Feb. 16, 2000] Available on the WWW at <http://www.cnnfn.com/2000/02/15/asia/wires/taiwan_trade_wg/>.

Paul, Satya.1999. "Relative Deprivation, Envy and Economic Inequality: A Comment." *Kyklos.* [online]. 52 (3):441-449.[Accessed on Feb. 16, 2000] Available on EBSCOhost. AN: 2239560.

OECD. 2000. "OECD Policy Brief: Economic Survey of the Czech Republic, 2000." [online] Washington: OECD Public Affairs Division, Public Affairs and Communication Directorate. [Accessed Feb, 16, 2000] Available on the WWW at <http://www.oecd.org/publications/Pol_brief/economic_surveys/e-czech.pdf>.

Organizing the Reference List: The reference list must be organized so that cited works can easily be found. Since the citation includes the author's name and date of the work, the list is arranged alphabetically by the author's last names and chronologically by date. That is to say, where an author has more than one work listed, the works are listed chronologically. If an author has more than one work from a particular year, adding and a, b, c, etc. to the year distinguish the works. Here is an example of a short reference list.

Reference List

Bueno de Mesquita, Bruce. 1981. *War Trap*. New Haven, CT: Yale University Press.

Bueno de Mesquita, Bruce and David Lalman. 1992. *War and Reason*. New Haven, CT:

Yale University Press.

Bueno de Mesquita, Bruce, David Newman, Alvin Rabushka. 1985. *Forecasting Political Events.* New Haven, CT: Yale University Press.

Bueno de Mesquita, Bruce, David Newman, Alvin Rabushka. 1996. *Red Flag Over Hong Kong*. Chatham, NJ: Chatham House Publishers.

Grieco, Joseph M. 1988a. "Anarchy and the Limits of Cooperation." *International Organization*.42:485-508.

----- 1988b. "Realist Theory and the Problem of International Cooperation: Analysis with an Amended Prisoner's Dilemma." *Journal of Politics.* 40:600-624

----- 1990. *Cooperation Among Nations: Europe, America, and Non-Tariff Barriers to Trade.* Ithaca, NY: Cornell University Press.

Citations: As discussed above, citations are used to attribute ideas to their original author and to document sources of information. In the author-date system, the citation is provided through the use of an in-text reference. This reference takes the following basic form:

(Last Name of Author(s) Date of Publication)

Citations are quite easy to form if the reference list has already been written. Given the example reference list, if one wanted to cite Bruce Bueno de Mesquita's book The War Trap, one would simply write:

(Bueno de Mesquita 1981)

Notice that only the last name is used (albeit a long one) and no punctuation is used between the name and the date. However, punctuation is used if there is more than one author as in this citation for Red Flag Over Hong Kong:

(Bueno de Mesquita, Newman, and Rabushka 1996)

Notice here that all three authors' names are included, commas separate their names and the conjunction "and" are used. That is to say that their names are written as they would be in a sentence.

More than one work by an author can be cited at once. In such a case, commas are used to separate the dates. If one wanted to cite Grieco's three works on cooperation, the following citation would be used:

(Grieco 1988a, 1988b, 1990)

Works by several authors can also be cited in one in-text reference. When so doing semi-colons are used to separate the
works of different authors or sets of authors as the following examples show:

(Bueno de Mesquita 1981; Grieco 1988a, 1988b, 1990)

(Bueno de Mesquita 1981; Bueno de Mesquita and Lalman 1992)

If reference is being made to a particular part of a work, the page, chapter, section, or figure number should be given in the citation (note p or pp is not used) A comma is used to separate the date from the page or section number. The following examples illustrate this:

(Bueno de Mesquita 1981, 15) (Grieco 1990, 20-25 (Bueno de Mesquita 1981, fig. 3.2)
Using Citations in the Text: Citations may be put in the text in one of three ways. If no reference to the authors or text being cited is made in the text, then the citation is included where it makes the most sense to be and where it will do the least damage to the flow. For example:

It has been argued that nations will not cooperate if they are concerned about relative gains (Grieco 1988a, 1988b, 1990). Others (Powell 1991; Snidal 1991) argue that nations may cooperate in spite of relative gains concerns.

If the author is referred to in the text, then only the date is included in parentheses. For example:

Bueno de Mesquita (1981) presents an expected utility model of war initiation.

Finally, if the work is referred to in the text, then the whole citation is included in the text. In such a case the citation acts as a short title for the work. For example:

The analysis in Bueno de Mesquita, Newman, and Rabushka 1996 indicates that Chinese policy towards Hong Kong will be turbulent for the next decade.

Chapter 2

History

There is a relation between the hours of our life and the centuries of time. Ralph Waldo Emerson

The past does not repeat itself, but it rhymes. Mark Twain

I. Introduction and definitions

Emerson and Twain's perspectives on history are a useful starting point for understanding the role of history in analyzing political-military phenomena. Both ascribe value to a historical perspective while avoiding any tendency towards an absolute reverence for history as a sole means for understanding.

The purpose of this chapter is to discuss the role of history in: 1) understanding the past, 2) helping to illuminate the present, and 3) casting some light on the future. The study of history is not a panacea for understanding other cultures, but it is possible to gain some insight based on an exploration of the past. History is also useful in another vein. Understanding the prevailing *conceptions* of history among a people, when used in conjunction with the other pol-mil factors, can be a powerful aid in designing psychological operations campaigns and in the planning and execution of civil-military operations.

One significant benefit of the study of history for the political-military officer is that it can make us less ethnocentric. "Historical study leads to broader views, to escape from the parochialism of the present, to an understanding that there were once other standpoints as commanding as the tenets of today" (Vincent, 1996, p. 25). Shafer makes a similar argument; the study of history can liberate "us from our own narrow experience, our own time, our own society . . ."(1960, p. 156). Studying history helps us to *unlearn* the prevailing myths that we have both about our own culture and others.

History is defined as 1) the actual events of the past, and 2) the academic discipline that studies the character and significance of past events. Because we can never have absolute knowledge concerning the actual events of the past, we will focus on the second definition. But the definition by itself does not elucidate the essence of historical study. In addition to describing the past, historians also attempt to explain it.

The study of history includes the selection *and* interpretation of facts about the past. In the words of historian George Kent, "Facts have to be selected, arranged, and interpreted before they acquire meaning . . . the same facts, differently arranged and interpreted, can be used to arrive at different, even opposite conclusions" (Kent, p. 309). Since history is about interpretation done by individuals, there cannot be a definitive interpretation. For example, at the end of the 19th century, the history of the American Civil War written from the Northern perspective was a much different story than the history of the War from the Southern perspective.

If there can be no definitive interpretation, then we must look to the philosophy of history to further understand the value of the historical perspective.

II. Review of the literature

Why study history?

There exists a plethora of introspective material written by historians focusing on questions concerning the utility and method of historical work. The ancient historian Thucydides gave the following reason for studying history: "The accurate knowledge of what has happened will be useful, because, according to human probability, similar things will happen again." (As quoted in Jordan, 1960, p. 53) Like Emerson and Twain, Thucydides does not tend toward an absolute.

Throughout modern writings there is a recurring theme that the study of history is useful. But there is also a strong admonition against simply trying to apply historical analogies to current events. Lessons are never so clear cut. In the process of studying history we learn that there are no perfect historical analogies, only complexities and subtleties. We must be on guard against those who claim excessive fungibility. It is at least as relevant to ask: How are things different?

For Leff, (1969) the study of history is "the record of difference rather than of similarity" (p. 60). And from Leff's perspective, this is the proper role: "Something is historically important in the degree to which it makes a difference." However, Pratt's approach may be more complete. According to Pratt (1974), the historian must explore both continuity and discontinuity. The historian's "interest in continuity obliges him to pay attention to similarities and generalities. His interest in discontinuity leads him to seek the unique, the novel, and the particular" (p. 208). Change and continuity are not mutually exclusive.

Concerning the utility of history, Schlesinger (1966) makes the point: "history generally serves as a 'negative' model rather than a 'positive' model" (p. 317). History does not tell the things that we must do, rather it tells us the mistakes that we ought to avoid. Schlesinger also warns against those who look to history for superficial analogies: "The only antidote to a shallow knowledge of history is a deeper knowledge, the knowledge which produces not dogmatic certitude but diagnostic skill, not clairvoyance but insight" (p. 320). History can be an interpretive *guide*, allowing us to make judgments about what is possible or probable, particularly when studying the long-term effects of actions.

Jordan argues that the study of history may not be immediately useful to the task at hand; nonetheless, it is valuable as part of a general education. According to Jordan, the greatest purpose of studying history is to increase "depth and breadth of insight" (p. 52). A broad understanding of history helps in developing perspective. For the political-military officer, the study of the history of a particular people helps in a general understanding of those people. And a study of what they *perceive* to be their history is of at least equal value.

From Kammen's (1979) point of view, the purpose of studying history is: "To make us more cognizant of human differences and similarities, over time and through space; To enhance our awareness of the complexity of historical causation; To acknowledge more fully than we do the consequences of what is at stake when powerful people interpret history for partisan purposes" (p. 57). History is not merely a factual subject; rather it is an analytical one: "an attempt to discover the *significant* things that have happened, and *why* they happened, what *caused* them and what *they* caused in their turn" (Perkin, 1970, p. 70). But Perkin is traveling down a dangerous slope because the issue of causality is rarely clear-cut.

Is the study of history science?

Concurrent with the rise of the social sciences in the 20th century, historians have debated amongst themselves on the nature of the study of history. Historians look at what has happened and they strive to answer the question: why? Historians often try to isolate causes. But the cause and effect relationship is nebulous in the study of history. Much of the debate is in response to the influential historian Collingwood and his theory of historical knowledge which postulates that the discipline of history "should be regarded as scientific because the methods appropriate to it are as rigorous as those utilized in the natural sciences and lead to conclusions which are equally justified and defensible" (As summarized in Pompa, 1995, p. 168). This attempt to create immutable laws as a result of the study of history is also a reflection of what was once the fashionable Marxist trend to create all-encompassing theory out of past events.

Vincent argues that the study of history is by nature different than the natural sciences because history "is no longer there." All that the historian can study are the particular pieces of evidence that remain, and "That evidence is an infinitesimal part of the evidence which once existed" (Vincent, p. 2). It follows that the interpretation of events based on partial evidence is inherently limited.

> Science gives the same results in every place and time; history is incapable of such replication, for each historical event is unique . . . historical circumstances do not have knowable, predictable, and replicable causes and consequences, in a way that causes regularly beget consequences in science. (Vincent, p. 18, 46)

As Pompa adds: "the subject matter of history differs from that of the natural sciences because history is concerned with human activities and experiences" (p. 168 in Broucher et al). The number of variables, particularly human action, defies the attempt to isolate causes.

Although moving from observations of the available evidence to generalizations is risky, this is not to say that some degree of induction can not be applied to the study of history. As political-military officers we can look for relationships as long as we realize the limits and understand that the rhymes occurring in the centuries of time are not absolute laws.

Types of written history

One can identify several classifications of written history. First it is useful to make distinctions based on the purpose of the author. Though all authors have the bias of their own

history and opinions, there is clearly history that is written primarily for political purposes. Of this type, there is the official or state-sponsored history that is most often the servant of the ruling regime. This history is what is most likely to be found in state sponsored/mandated educational programs, which is not to suggest that all state-sponsored history is necessarily of this type, but the caution flag must be raised.

There is also the writing of history that supports political positions already formed. Butterfield (1951) argues that political leaders and statesmen use "history to ratify the prejudices they already had" (p. 227). By the same token, if you look for historical examples to support your preconceived point of view, you will find them.

It is also possible to classify based on what is covered. Much of written history falls into the category of political histories (to include diplomatic histories). This type of history focuses on the milestones and the events that seemingly "changed" history. But this type of history is not sufficient if it does not examine the context and the "system of values to which it belongs" (Leff, p. 62). To the extent that political history ignores a fuller social context, it risks missing important underlying factors.

Another category of history popular in the last century is economic histories. These studies often examine development or the lack thereof, the distribution of wealth, and socio-economic conditions and strive to make generalizations based on the economic systems in place. But historians of different bents can examine much the same evidence and arrive at very different conclusions.

Finally, there is what some historians call total history -- a history that focuses not only on politics but also includes social and cultural history. Butterfield was a strong advocate of this approach. In *The Whig Interpretation of History* he argues history should be the study of more than just kings and battles where the focus is only on politics. This type of total history will probably be the most relevant for the political-military officer.

Role of myth

No philosophical discussion of history can be complete without examining the role of myth. In the words of Vaughn (1985), "myth is more powerful than truth in guiding our actions; what we believe to have happened is more important than what did happen" (p. 10). Dunning echoes this sentiment: "whatever a given age or people believe to be true, *is* true for that age and that people" (as quoted in Kent, 1969, p. 310). This is not to suggest that the political-military analyst should only study myth, but it is important to understand the role and power of myth.

III. What/how to study?

As previously mentioned, historians, like so many others, do not agree. Two observers can look at the same events and draw very different conclusions and/or lessons. It is therefore prudent to be cognizant of sources of bias and proceed with caution.

There are many sources of bias, both intentional and unintentional. Related to the

previously mentioned bias of official history, is the possibility of a difference between what actually occurred and what is recorded. As Vincent points out, there is "bias in the creation of evidence, and a bias in the survival of evidence," (p. 51) and there is also a bias in what is accessible. By any name, much of what transpires in terms of both government and non-government action is "classified." Since the evidence is imperfect, so too may be the conclusions.

Because the study of history is the study of abridged history, we must be mindful of Butterfield's (1951) admonition:

> Abridged history gives men a greater appearance of sovereignty over events than they actually possess; and it tends to magnify the controlling power of governments over the next stage in the story . . . men and nations rely on the abridged history they have learned to give them their impression of their place in the sun, their purposeful intent, and their idea of what they can do with their destiny. They acquire an academic dream-impression of what statesman can do in the world, what governments achieve, what their national mission is, and what can be brought about by sheer self-assertion and will. (p. 226)

This is not presented to minimize the role of planned efforts and campaigns; it is only meant as a caution.

In selecting materials for study, there are two basic types of sources: primary and secondary. Shafer defines primary sources as: "manuscripts, published letters and memoirs of eyewitnesses, the public documents, the newspapers, the pamphlets, the books, and the material remains of the time about which we are writing" (p. 151, 152). Secondary sources are historical manuscripts derived from primary sources or from other secondary sources (which would more properly be called tertiary).

One of the greatest challenges in studying history is in selection of materials. The limits of time will often not permit us to study and focus on primary sources, so we usually must choose from the multitude of secondary sources. The key will be to use your knowledge about the discipline of history to aid in the selection of secondary sources. Then you must read those sources with a critical eye. Because of the omnipresence of bias, you should choose multiple and varied sources. It is particularly useful to read history from both the native perspective and the western perspective and then synthesize based on those sources. In making your choices, ask for assistance from others who have studied the area. In addition, you should consult annotated bibliographies. Trevelyan (1914) sums up the importance of reading diverse points of view: "The only way in which a reader can arrive at a valuable judgment on some historical period is to read several good histories . . . written from several different points of view, and to think about them for himself" (p. 198).

In addition to selection of materials, there are several issues to be aware of when studying history. For example, how far back should one look? There is no easy answer, but generally it must pass the relevancy test. That is, what events and periods seem to have an effect on current events and the current psyche?

The role of "facts" must also be considered. While facts in and of themselves are not

very useful, knowledge of facts and their context can help us arrive at insights. Knowing dates can be enlightening but only as part of the larger picture. For example, knowing that the American Civil War started in 1861 and that the Emancipation Proclamation was not issued until 1863 can shed some light on causal arguments. In addition, for the political-military officer, the knowledge of key dates in a region *and their importance* can also increase credibility with members of host nations.

When studying history (and the present) it is important to avoid the mistake of simply looking at political structures and arriving at conclusions based on those structures. Structures do not tell us how things may actually operate. For example, the rules of the U.S. Congress, the importance of agenda setting and control, the role of lobbyists, and the cost of election campaigns, may tell us more about the operations of Congress than a superficial look at structure.

The reading of historical documents is also not sufficient. If one were to merely read the contents of the Thirteenth, Fourteenth, and Fifteenth Amendments to the U.S. Constitution, one may well conclude that U.S. citizens were at last equal under the law. But if one continued with a study of court decisions, a social history, and an examination of poll taxes and literacy tests, then one would arrive at a very different conclusion (Zinn, 1970, p. 163).

IV. Questions to consider

What are the understandings about history that are prevalent? What are seen as the key events by the people?

What roles does the study of history perform in the society? What role does history play in the socialization of the young?

What are the historical analogies used by the current regime in support of policy? How does the regime use history to legitimize the current order?

What is the prevailing story associated with the birth of the state?

What are some of the prevailing historical myths?

What are the events and milestones (collective memory) that have shaped the current psyche? What is the perception about those events? What are the purported causes of selected significant events?

What are the important historical ideals? (e.g. the Declaration of Independence has certain ideals.)

Who are the important historical/legendary figures and what are their purported attributes?

What are the threads of continuity in the state's history?

What is the history of current political and social issues?
What are the significant variations in different sources?

V. Discussion of inter-relationships with selected other pol-mil factors

Given enough time, you could look at each of the other political military factors from a historical perspective. In fact, in many cases you will do this as a matter of course. In examining a political, social, or economic issue you generally can not understand the issue without looking at its history. For example, current monetary policy in Germany is probably affected by the German historical experience with inflation in the post WW I period.

Culture and history are inextricably intertwined. Shared historical experiences are one component of cultural tradition. According to Lerner (1982), history itself is a cultural tradition: "A shared body of ideas, values and experiences, which has a coherent shape, becomes a cultural tradition" and this "symbolic universe" can unite diverse groups (p. 106). And the method by which a culture captures and depicts its history sheds light on the way the culture comes to terms with its actual history.

As a political force, history can unite and divide. A common history can help to establish tradition, bind men together, and foster a sense of belonging:

> Nations, institutions, and social groups use it to inspire loyalty to themselves and to create a sense of shared community by the telling of stories about past struggles, victories and defeats, and the sacrifices made for the benefit of posterity. Heroes are held up for emulation and villains paraded as warnings (Nevins, 1938, 236).

People can be "bound together by reverence for the tale of their past" (Nevins, p. 241) or they can be separated by a history of ethnic disputes.

As previously mentioned, history is also intertwined with political systems and leadership. History "legitimates those holding power, by rooting its source in a distant past" (Lerner, p. 106). An historical perspective can show how political leaders use ideology to mobilize, legitimize, and retain power *and* it can show how those not in power use ideals in pursuit of power. The tendency for cultures to "make legends out of its leaders is a factor of immense historical importance" (Gallie, 1978, p. 80). To understand the qualities that are revered by a culture, look at its historical leaders. But when examining a historical figure, remember to relate the personage to the context in which they operated.

VI. Summary

That there is a relation between the past and the present, is not to suggest that they are twins. History does not provide universal laws. "History does serve some useful purposes, but it is not an infallible teacher . . ." (Stephens,1974, p. 98). Historical analogies have their uses in *thinking* about the present and future, but only if we accept the limits. Butterfield's admonition can be expanded to include the entire spectrum of military operations:

> "If men are to shape their minds too rigidly by a study of the last war, they are to some degree unfitting themselves for the conduct of the next one. If a nation decides conversely that it will set out with the particular purpose of avoiding the mistakes of the last war, it is still liable to be the slave of history and to be defeated by another nation that thinks of new things. Historical study, therefore, has sometimes had a deadening effect on military strategists; and it has often been a criticism of them that they were too prone to conduct the present war on the method of the previous one, forgetting how times had changed.
>
> It seems true, however, that many of the errors which spring from a little history are often corrected as people go on to study more and more history. If a man had a knowledge of many wars and of the whole history of the art of war, studying not merely the accounts of battles and campaigns, but relating the weapons of a given period to the conditions of the time, relating policies to circumstances, so that he came to have an insight into the deep causes of things, the hidden sources of the changes that take place -- if he allowed this knowledge not to lie heavily on his mind, not to be used in a narrow and literal spirit, but to sink into the walls of his brain so that it was turned into wisdom and experience -- then such a person would be able to acquire the right feeling for the texture of events, and would undoubtedly avoid becoming the mere slave of the past. I think he would be better able to face a New World, and to meet the surprises of unpredictable change with greater flexibility. A little history may make people mentally rigid. Only if we go on learning more and more of it -- go on 'unlearning it' -- will it correct its own deficiencies gradually and help us to reach the required elasticity of mind."

While the study of the past is often a necessary condition for understanding the present, and the possibilities of the future, it is never a sufficient one (Pratt).

Chapter 3

The Natural Environment

I. Introduction and definitions

The economic, political, social, cultural, and even military behavior and development of any society are influenced by that society's natural environment. The effects of the environment can be discerned--sometimes distinctly, sometimes subtly--in almost every aspect of a society, including the way it is organized and ruled; its trade patterns; its population growth, distribution, and migration; its eating habits and style of clothing; and its military formations. If a political-military analyst wants to do sound political-military analysis, his first step is to understand the environment of the region in which he is operating. Just as no one would attempt to launch an attack without first studying maps of the battle area--preferably with a good leader's reconnaissance on the ground as well--neither can they hope to analyze a country or culture without first knowing the environment in which it exists.

Natural Environment Defined

When discussing the natural environment, be concerned with the three-dimensional terrestrial space centered on the earth's surface within which all material things are contained.

When analyzing the natural environment, divide it into four spheres.

Atmosphere: The layer of gas around the earth. The condition of the atmosphere at any given time we call weather. The condition of the atmosphere over time we call climate. Climate, more than anything else in the environment, sets limits to what man can physically and economically do. For example, the debilitating heat and humidity of the tropics and the bitter cold of Siberia and northern Canada have hindered development in these regions. The cultural habits of many societies are linked directly to climate conditions. For example, the midday siesta-which is by no means limited to Central America--is a result of people's understandable desire to avoid work in the hottest part of the day. Other aspects of the atmosphere are of interest to us as well. For example, the thin air in the high altitudes of the Andes or Himalayas limits the amount of physical exertion that can be done in these regions. The quality of the atmosphere has also become an important concern lately as noted from issues arising from air pollution or depletion of the ozone layer by chlorofluorocarbons.

Lithosphere: The soil and rock crust of the earth and all that is beneath it. Landforms may facilitate or inhibit transportation and interaction among societies. The fertility of the soil or its ability to retain moisture can have a significant influence on societal development. Transplanted soils, such as the alluvium of the Nile River in Egypt or the loss of the Yellow River valley in North China, can be critical to the support of civilizations. Minerals, gems, oil, and liquefied natural gas have at one time or another had a great influence on societies around the world.

Hydrosphere: Water in liquid form, including rain. Water is key to human civilization and to plant and animal life. If water is scarce, people may have to move around to find it, leading to a nomadic lifestyle. If it is plentiful, a more sedentary lifestyle may be possible. Water can provide a means of irrigation, a source of power, or routes of transportation. For example, fully 70 percent of the land under cultivation in Pakistan is irrigated; much of the electricity in the United States is provided by hydroelectric plants; the extensive interdigitation of water with the land in the United States and Europe facilitated contact among societies, while the lack of extensive interdigitation in Africa has hindered interaction and exploration there. Average rainfall can be a significant influence as can the time of rainfall or even the quality of the rain. Finally, even if water is plentiful and the rain clean, water must be safe to drink. As with the atmosphere, pollution in the hydrosphere is a serious issue. There is an on-going debate in certain parts of the world today over who owns the rain and who is responsible if the rain is contaminated.

Biosphere: Living things on the earth. This includes everything from seaweed to sunflowers to sequoias and from microbes to muskrats to men. Three important aspects of the biosphere are human population, food, and disease. They are, of course, interrelated.

For people to exist, there must at least be a subsistence level of food and water. As with the hydrosphere, if food is scarce, a society may have to search for it and so become nomadic. If food is plentiful, societies may be sedentary, which may in turn allow for greater specialization and development within the society, since fewer people have to be involved in the quest for food. But, food must not only be plentiful, the diet it provides must also be balanced. There are several examples of people having plenty to eat who still suffer from malnutrition, such as the 19th century Irish whose diet consisted largely of potatoes. Finally, what is considered food in some societies may not be acceptable in others.

Disease may override all other factors in the biosphere. It can be transmitted by microbes, insects, animals, or men. It can inhibit development or even deplete a population. Many diseases are not killers, but can incapacitate or cripple their victims. Some diseases may not infect humans, but can decimate animals or plants, depleting the food supply. Finally, curing a disease or developing an immunity to it may increase the population beyond the capacity of the environment to adequately support it.

When disease is prevalent but localized to one segment of a population or one area, it is called epidemic. When it is spread over a large area throughout a population, it is called pandemic. When a disease is always present and has established an equilibrium among a population, it is called endemic.

Naturally, these four spheres do not exert influence independently. (In fact, they do not exert influence at all--environmental influence is passive.) Mountain ranges, deserts, grasslands, or waterways may facilitate or impede migration of species. Weather patterns are affected by bodies of water or landforms. The effects of rain can be beneficial or disastrous, depending on the location of rivers, wadis, valleys, and the type of soil on which the rain falls. To understand

a region's natural environment, don't look at just one sphere or one factor within a sphere (e.g., climate or resource distribution), look at it in total.

Geography Defined

It should be clear by now that political-military analysts study the natural environment to discern its interrelationship with human beings. Geologists, hydrologists, biologists, zoologists, meteorologists, and the like, study the environment as an end in itself. Political-military analysts, on the other hand, are interested in the field of study known as geography, which is the study of the relationships of various human phenomena and terrestrial space. (There is also a field known as physical geography that deals with non-human phenomena, but we have already discussed aspects of this when talking about the four environmental spheres.) Geography deals with the pattern of man's distribution over and his use of the earth, why he uses it differently in different places and times, and how this is related to man's economies, culture, political systems, etc. Geography is concerned whenever the concept of place or the question of where is involved.

When studying geography, the first thing to do is to distinguish between the concept of site or location and situation. Site/location is the actual ground on which a geographic phenomenon rests. This is important only insofar as it helps us understand the relationship between one area and the rest of the world and the effect of those relations, that is, that phenomenon's situation. It is not only important to know where things are, but also to know why they are there and how their location allows them to influence or be influenced by things elsewhere. This should not be difficult to understand. If the mission is to "take that hill," it is not because that hill is valuable in and of itself, but because controlling it is an advantage over the enemy. On a larger scale, knowing the number of miles of navigable waterways in a particular region *is less* important than knowing the patterns of distribution and interaction those waterways support. Situation, then, is relative. It is also changeable.

The growing concern among many nations over ownership of continental shelves is one example of how a geographical situation can change. Ordinarily, under international law, a continental shelf is considered to be the territory of the country from which it extends. The shelf normally does not extend for more than a few miles, but in some places it goes out considerably farther. Until relatively recently, even these longer extensions did not cause much trouble among countries. Now since technology has improved enough to allow the exploitation of the resources in the shelf, especially oil, countries are beginning to lay claim to territory they previously ignored. A similar occurrence is taking place with regard to small, often deserted atolls, such as the Spratley Islands in the South China Sea, which are claimed by no less than seven countries--all of whom hope to extract the oil believed to be in the vicinity.

II. Discussion of inter-relationships with selected other pol-mil factors

Six basic principles underlie the connection between human society and the environment.

Principle 1: Humans must form a workable connection with the environment. It does not have to be the optimal relationship, but it must at least allow the society to survive.

Principle 2: A human society and its environment form a system of interrelated elements, and change in one aspect can have significant ramifications throughout the system. Environmental change can occur two ways. First, **change may occur naturally** through such events as volcanic eruptions, floods, winds, or species proliferating or dying out without man's help. Second, change may be man induced. **People** have fundamentally remade the landscape in every area of the world that he has occupied in great numbers. He has dug canals, changed the course of rivers, built harbors, tunneled through mountains, cut down forests, planted new ones, depleted the soil or made it fertile, made deserts bloom, and turned verdant lands into deserts. The changes man creates in his environment react in turn on man and influence his settlement and activities. Man-induced change is not usually as sudden as natural change, but it is no less dramatic--or in some cases, no less catastrophic--for that.

Principle 3: A given environment can support several different types of societies.

Environmental conditions may provide opportunities and possibilities, but only human activity can make them reality.

The environment influences society, but does not determine it. Different people look for different things in similar environments and produce different results. Of the many things that are possible or which environmental conditions will allow, men will choose to do certain things because of a variety of factors that help shape their civilization, such as **political pressure**, **tradition, or cultural values**. Environmental conditions may tend to make one or a few choices more attractive or more successful than others, but choices may differ widely among different societies and at different times. This, of course, does not mean that the environment can be ignored in analysis, but that it should not be the only influential factor.

Principle 4: No environment is either favorable or unfavorable to all types of societies. A change in any element of **culture** may alter the significance of the natural surroundings. This is particularly true with regard to the impact of technology. Consider how the advent of air conditioning has influenced population distribution in places as disparate as Houston and Hong Kong. Even natural resources are resources only if we know how to use them for our purposes. The influence of the environment may become less important as technology increases, or things once taken for granted may become clear (e.g., clean air and water).

Principle 5: Just because a society is blessed with a rich environment does not mean that the society will prosper. **History** abounds with examples of societies that languished in the midst of plenty because of cultural constraints, inability to use the wealth at hand, or incompetent leadership. Similarly, a society in an austere environment short of resources may still be prosperous, such as Japan or the Asian newly industrialized countries.

Principle 6: The environment can affect human affairs in two ways: how man sees the environment and how it actually is. The first is actual or operational influence. Mountains and rivers may be impassable, soil sterile, or water scarce. The second way is perceived influence. Men may simply believe that they cannot cross mountains, grow crops, or find ample water. These beliefs will cause them to act in certain ways, whether the beliefs are true or not. **Military**

history alone is rife with examples of armies defeated by enemies who attacked over routes believed to be impassable.

The Concept of "Region"

One of the concepts used for analysis in geography is that of the "region." An area may be distinctive as a region because it coincides with the distribution of a particular type of climate, landform, or soil, or because it is characterized by a particular type of economic activity, land use, political system, culture, religion, etc. The first problem in regional analysis is to determine what gives the region its essential distinctive quality. Only then can we draw satisfactory regional lines.

The concept of "region" is a useful intellectual device for analysis, but we must remember that regional distinctions are products of our own minds, not complete descriptions of reality. In this sense, there are no "natural regions," only man-made or man-perceived classifications of regional differences. As such, regions can be single factor or multifactor. Regional differences are usually related in part to differences in the physical environment, but only in part. Differences are due as much to human society as to the physical environment.

Regions usually spread from a "regional core," also known as a "culture hearth." This is the hub or axis where our distinctive regional feature is most prominent. It may be a physical feature (e.g., a fertile plain, river, valley, or seacoast) or a cultural feature (e.g., center of political or military control, dominant trading center). Usually, this core is the first area to develop the dominant regional characteristic, which then spreads over the surrounding area as far as physical or cultural conditions will allow. The impact of a cultural characteristic may extend well beyond areas to which it is suited.

On the periphery of a region is the "transition zone" where the qualities that delineate one region significantly diminish and are replaced by another set of qualities belonging to another region.

Mental Maps

When an analyst looks at the world and studies his region, he has to be conscious of the tendency to see the world through his own "mental map." This mental map is the way he perceives the world and will rarely accurately reflect the world as it is. Part of this is due to his culture and to the use of ethnocentric maps in the education system. There are numerous examples of this type of distortion, such as placing the United States (or any other country) in the middle of a map, splitting Russia in half, or placing Alaska and Hawaii in the corner of a map off the coast of California, which belies the distances involved.

Another source of distortion in an analyst's mental map comes from his use of classifications as analytical tools. For example, the Philippines and India are both considered part of the "region" of Asia when in actuality, they have very little in common. Similarly, he tends to think of the Muslim world as being in the Middle East (another distortion of his mental map); when in reality, the most populous Muslim country is in Asia.

A third distortion may come from limited time on the ground in the region. This can be a case of a little knowledge being more dangerous than none at all. For example, a foreign traveler in China is generally limited to going from one city to another and may well come away with an impression of China as an urbanized country, although 80 percent of the population lives in the countryside. By the same token, an American soldier along the DMZ with the 2d Infantry Division in the Republic of Korea (ROK) will likely believe that the ROK is an underdeveloped country, unless he takes the time to visit Seoul and other parts of the country. Lastly, the longer people are away from a country, the less likely they are to see it accurately, both because their memories will begin to fade and because the country will have changed since they left.

Another way an analyst's mental map is formed depends on the areas and problems he is studying. It is natural for him to think that the area on which he is concentrating is the most important in the world and that the decision-makers are not paying near enough attention to it. Additionally, as he deals with situations and crises, certain countries assume greater importance in his perception of the world. Some distortion is natural and unavoidable, but be cognizant of their existence.

III. Some Analytical Questions to Consider

What are the consequences of economic development on the natural environment?

What effects has the natural environment had on the history of the country?

What effects has the natural environment had on culture?

What effects has the natural environment had on the country's economy?

What advantages and disadvantages stem from factors relating to the natural environment?

What effects has the natural environment had on foreign influence?

How has the effect of the natural environment changed over time?

How has the natural environment affected the country's military?

Can technology, science, and industry surmount all future natural resource problems?

IV. Conclusion

The political-military factor of natural environment interacts with several other factors. The natural environment may or may not be a limiting factor depending on its interplay with the other factors. A favorable natural environment may contribute to country's development, but it is not a sufficient condition.

Chapter 4

Regional Perspectives

"A day will come when all nations on our continent will form a European brotherhood… A day will come when we shall see…the United States of America and the United States of Europe, face to face, reaching out for each other across the seas." -- Victor Hugo (1848)

I. Introduction

Regional perspectives are an important factor with which the political-military analyst must deal. Regional perspectives color the manner in which events are perceived, leading to reactions that may be quite unanticipated. The analyst must be able to identify and understand the general regional perspectives on a broad range of issues to judge their effect on future actions within the region. This is no simple task because of the complexity involved. International relations are not dyadic; every event affects secondary and tertiary actors through their individual perspectives and regional orientations. Explaining and predicting these effects is the job of the analyst.

Regional Perspectives and Where They Come From

Regional actors form their perspectives based on their perceptions of individual and collective interests on specific issues. These may be developed over a wide range of topics such as ideology, economic policy and developmental planning, military strategy, alliance relations, East-West and North-South conflicts, terrorism, and nuclear proliferation. Factors such as threat assessments, individual and collective capabilities, relative regional economic position, cultural traditions, religious orientation, political philosophy, and historical experience contribute to the forming of regional perspectives.

A region's perspective can often be determined by what its leaders say, what the states do, and by formation of organizations that reflect regional elements of unity. For example, the formation of the European Union, the Arab League, the Association of Southeast Asian Nations, the Organization of African Unity, and the Organization of American States were each motivated by a particular regional perception of threat (economic, political, or security). Each organization seeks to capitalize on a particular characteristic that can lead to greater regional or collective power and prestige through unity.

The Gulf Cooperation Council: An Example of Regional Perspective

The six Arabian Peninsula states (Kuwait, Saudi Arabia, Qatar, Bahrain, the United Arab Emirates, and Oman) of the Gulf Cooperation Council (GCC) share many things in common including geography, religion, monarchical political systems, oil interests, and security concerns. However, traditional rivalries among the states has prevented them from uniting for their common good, even though as individual actors they lack the power for credible deterrence. Iraqi threats on Kuwait in the late 1970's

and the fear of Iran's ultimate goals in the Persian Gulf fostered cooperation between these Persian Gulf states. In 1981, eight months after the Iran-Iraq war had begun, these states joined together in a union for partial economic and cultural integration. That union had evolved into one which now includes elementary joint defense agreements and closer coordination on foreign affairs. Through collective action, their coincident individual interests are stronger and continue to gain greater international importance. Through joint economic policies, they have reduced competitive and redundant development planning. Integrated defense planning has maximized the individual strengths of each member, producing a more credible deterrent to external aggression. The 1990 Iraqi invasion of Kuwait gave a significant boost to concrete measures in developing a credible deterrent.

Determining Regional Perspectives: Tools and Methods

How can the analyst determine what regional perspectives are? At the individual state level, trends in foreign policy, economic relations and policy positions consistently pursued by political, military and business leaders provide the basic answers. More answers can be deduced by charting actions and responses of regional actors following a crisis event. At the regional level, one source to examine is the agreements that establish regional organizations. These often contain specific statements, arrived at by group consensus, which outline those perspectives.

Of primary concern in determining regional perspectives is the regional assessment of a wide variety of threats. The United States viewed the former Soviet Union as the principal threat to American interests abroad. The USSR was considered the only nation that could credibly challenge the territorial integrity and survival of the United States. Additionally, it could challenge any of America's allies.

Most challenges to the United States were viewed as coming from issues related to the East-West conflict. For this reason, the United States shouldered the burden of maintaining a global perspective in foreign relations. Today, as the sole remaining "superpower" that far-reaching perspective has taken on new meaning yet to be defined.

Regional actors rarely enjoy such responsibility, perceiving a variety of more proximate threats to their survival ranging from internal instability to regional radicals and historical conflicts that constantly threaten to flare up and expand. For regional actors, these types of challenges appear to have a greater likelihood of causing change in the near term (1 to 2 years) or mid-term (3 to 7 years) than the broader external challenges. For obvious reasons, regional actors focus on these more immediate threats. This often leads to a virtual lack of concern for externally generated pressures.

The Conflict Between Global and Regional Perspectives

While the United States is concerned with regional issues as they relate to a global picture, regional actors do not often link regional and global events--their perspective is more limited. The result is often a misunderstanding, stemming from different

perspectives, over both the importance of events and responses that are appropriate to achieve desired results.

Often, even the desired results are different. For example, the United States had previously identified the Soviet Union as the major source of instability in the Persian Gulf, which threatened Western access to oil. To counter this threat, a decidedly military strategy was adopted.

Ideally, the stationing of American troops in the area would seemingly serve to protect US interests. From a regional perspective, however, the major causes of instability are Islamic fundamentalism, Iraqi ambitions, and the nonresolution of the Palestinian problem--all of which threaten the political stability of established regimes.

The strategy to resolve these sources of conflict is diplomacy. Stationing of American troops directly in the Persian Gulf may not achieve the expected results; in fact, it would possibly only exacerbate the problem by providing an additional focus for the opposition in its attempt to undermine existing rulers. Conflicting perspectives such as these make unified actions between the Persian Gulf States and the United States difficult, requiring the utmost in diplomacy with a nearby but "over-the-horizon" military presence.

II. Some Questions to Consider

What regional organizations does the host country belong to?

What regional treaties/compacts exist?

Are there obvious foreign policy trends?

What are the nation's responses to crises?

III. Summation

Regional perspectives focus on those issues that more immediately threaten local security and stability. The analyst must understand the roots of those perspectives, the depth of commitment to each issue both regionally and by the individual actors, and the areas of agreement and disagreement with the global perspectives of the United States. Such an understanding can serve as a basis for explaining regional behavior and predicting probable responses to a variety of possible actions.

Chapter 5

Foreign Influence

"It can be harmful to come, without thought, under the sway of utterly new and strange doctrines."
-- Confucius (450 BC)

I. Introduction

History is riddled with examples of countries being influenced by forces that emanate from beyond their borders. These forces can shape culture, affect policy, change economies, threaten national security, or even topple governments. Recognizing and understanding the role foreign influence plays in the political-military environment of a country will assist the analyst in accurately assessing the overall situation of a country and making predictions about its future actions.

Foreign influence can be either direct or indirect. Direct influences are actions perpetrated by a foreign government or actor with the express purpose of influencing policy or actions of a specific state. Military actions or economic sanctions directed toward a country are examples of direct foreign influence. Direct foreign influences do not necessarily have to be government to government. Organizations such as the International Monetary Fund can also exert pressure on a country to effect change. Churches and religious leaders, such as the Pope or the late Ayatollah Khomeini, have also been known to target specific countries in an attempt to effect change.

Factors of foreign influence not under the direction of a specific outside agency can also affect the actions of the host country. These indirect foreign influences can come from a variety of sources. The adaptations a political system must make in response to these influences are not the goal of a specific agency but more a by-product of the change. Immigration that results in demographic change, expatriate foreign remittance to relatives, competition on international markets, technological advances, students educated in other countries and religious fundamentalism are a few examples of indirect influences that could affect a country and may or may not result in changes to that system.

There are numerous elements that may either encourage or discourage foreign influence in any given country, and it is beyond the scope of this short introduction to address them all. Therefore, four main elements will be identified in this chapter: geography, economics, cultural/ethnic factors, and history. The elements as they pertain to analysis within a particular country are covered elsewhere within political-military analysis. However, when discussing foreign influence, or the susceptibility of a nation to foreign influence these factors take on a slightly different light. Categorization of these elements is not of the greatest concern, but the identification of their presence and their possible impact upon a country is important.

Geography

Geography, both in terms of terrain features and actual location, does much to inhibit or encourage foreign influence. Obviously, a country with clearly defined borders that inhibit

transportation and communications will be less susceptible to foreign influence. The isolation of the Japanese islands, caused in great part by rough seas and difficult coastlines, made it for the most part immune from Chinese conquest despite its relative proximity to China. Compare this to Korea or northern Vietnam where the boundaries were not well defined and where Chinese influence played a major role in the development of their cultures. In Europe, the case of Poland and its open frontiers, is perhaps best known.

However, advances in communications and transportation have overcome many of the natural obstacles that for centuries protected and isolated countries. In the 19th century, technology enabled Admiral Perry to use his black ships to open the doors of Japan to the world after 200 years of self-imposed isolation. Or consider the more recent example of the Hunza region in northern Pakistan. For centuries Hunza has been a remote area isolated by distance and difficult terrain not just from neighboring countries but also from the central government. Recent advances in communications and transportation have made Hunza more accessible from the north, and thus more susceptible to Chinese influence. However, the distance between Hunza and Islamabad continues to isolate it from the rest of Pakistan. Features that at one time protected Hunza now aid the growing Chinese influence in the area.

Although terrain features of a country, such as rivers, mountains, or coastlines may make it more or less susceptible to foreign influence, the actual location of a country can do the same thing. For example, the Chinese see Korea as "lips to teeth," protecting the approaches to several major coastal cities; the Japanese have seen it as a "dagger" pointed to the heart of Japan; while to the United States, South Korea was not only a "bastion of freedom" facing the Communist threat, but was also the only US military foothold on the continent of Asia. .

However, a note of caution is necessary; location is not necessarily decisive. The analyst must consider how human will and technological advances can impact on elements of power. Returning to the Korean example, despite what has already been said about the peninsula, North Korea has forced a path of self-reliance with little influence from the former USSR, PRC, or any other outside force. Poland is another example of a country with an independent attitude, regardless of its geography. Located on the central European plain, with no easily defined geophysical borders, it has for centuries been an historical battleground between the Slavs and the Teutons. In spite of frequent incursions, the Poles have developed a determination to resist.

Economic Influence

The second element of foreign influence, economics, can, like geography, manifest itself in many ways. So long as countries are economically dependent or interdependent on others, influence will exist. There is no doubt that during the heyday of colonialism the influence of the European powers was felt heavily throughout the world. Economics was one of the driving forces behind the mercantilist expansion of the Western nations over the world. Economic activity took place at the direction and benefit of the colonial powers. The colonial relationship has left many economic legacies that exist to this day in terms of trading partners, items of trade, and economic institutions, as well as type and degree of development, legal and governmental systems, and elites.

Colonialism aside, the element of economics is a major consideration when determining the presence and extent of foreign influence. Countries that are economically dependent upon outside

sources of supply for critical items may let the source of supply influence their foreign policy. For example, Japan's heavy dependence on Middle East oil has caused Japan to refrain from taking a hard-line stand against Libya in response to terrorist activities.

Countries that depend on exports can be influenced by the policies of the countries they export to. The United States, for instance, uses the threat of increased protectionism toward foreign imports to pressure countries such as Japan, Korea, and Taiwan to drop trade barriers against US products. Also, countries with limited resources and whose economies are tied to the export of a single commodity may become dependent upon their export markets and leave themselves vulnerable for unbridled influence by foreign governments or multinational corporations. Other considerations include the existence of sanctions or trade embargoes.

It is also necessary to consider the regional organizations which may influence a country's economy. Being on the inside or the outside of organizations such as the North American Free Trade Agreement (NAFTA), the European Union (EU), Organization of Petroleum Exporting Countries (OPEC) or Asia-Pacific Economic Cooperation (APEC) can and does influence policy.

However, economic dependency on other countries doesn't always mean total subordination. Countries need not be subservient to suppliers or markets. Japan, Taiwan, and Singapore are examples of countries that were at one point totally dependent upon another country; all now more than hold their own on the international scene and, for the most part, chart their own destinies.

Cultural/Ethnic Influence

The third element, cultural and ethnic influence from foreign sources, is obvious in many regions around the world. Countries with large expatriate populations may be susceptible to formation of a "fifth column," directed and controlled by an outside source. Communist insurgencies in Malaysia, Indonesia, and Thailand were linked to the Chinese minorities living in those countries.

Where ethnic identities cross national boundaries, the ability of one country to influence another is also increased. Consider the case of Pakistan. Resurgent Islamic fundamentalism originating in Iran has found its way into Pakistan in part through the Baluchi ethnic minority, which occupies both sides of the border between Iran and Pakistan. In addition, on Pakistan's border with Afghanistan, ethnic Pathans, whose tribal lands cross the border, were used as a conduit for influence by the Soviets occupying Afghanistan. Soviet goods, money, and propaganda were used to alienate the Pathans from the Islamabad government, thereby loosening the Pakistani control of the tribal areas near the border.

Religion has the ability to be a conduit for foreign influence both through the adaptation made in a society to accommodate the religion over time and, therefore, direct influence of individual religious leaders, or through the evolution of religious movements seeking change. Traditions and doctrines of the Roman Catholic Church have influenced the Philippines in deep and lasting ways, making it unique in Southeast Asia and tying the Philippines to the West in a way different from other Asian nations.

Consider the influence of Islam in Southeast Asia. Although located thousands of miles from the Middle East, Malaysia and Indonesia have been affected by resurgent Islamic fundamentalism from the Middle East and have had to adapt to accommodate its influence.

History

The fourth and final element of foreign influence to be discussed is that of history. Countries with a history of relations with another country tend to continue to be influenced by that country. The historical animosities between China and Vietnam continue to influence the current situation in Indochina. The relationship between the United States and the Philippines, built upon since the turn of the century when the Philippines were a US possession, plays a considerable role in influencing both US and Philippine policies toward each other.

Knowing the elements of foreign influence will help the analyst understand the ways in which one country can be influenced by an outside force, but determining the nature and extent to which it affects a country is most important. Some additional indicators an analyst might examine are the types and numbers of treaty and alliance relationships a country has and the international organizations to which it belongs. The study should also include an examination of the nature and diversity of countries' interactions with the outside world. Some specific items to consider are joint military planning or joint training exercises, UN voting records, patterns of trade, foreign investment, aid relationships, technology sources, and overseas education. Consider also the influences of non-governmental organizations (NGOs) and private volunteer organizations (PVOs). These organizations involved in routine work or in disaster relief/humanitarian operations, can have far-reaching influences. Likewise, the blinding advances in Internet access and satellite technology can influence the way people eat, dress and how they view the rest of the world. The analyst should also consider the less obvious indicators such as tourism or cultural exchanges.

II. Some Questions To Consider

What are the direct and indirect influences?

Does geography affect foreign influence?

What economic influences are there?

Are there cultural or ethnic influences?

Do historical influences exist?

Are there NGOs and/or PVOs present?

What is the effect of technology (i.e. Internet, satellite media, cell communications)?

III. Summation:

As a factor of political-military analysis, foreign influence is directly related to several other factors. In actuality, it cannot be separated from factors such as history, religion, culture, geography, and economics, which serve as conduits for influence. Recognizing the susceptibility of a country to foreign influence and determining the type and degree of that influence within a specific country, allows a more accurate analysis to be formed.

Chapter 6

National Interests

"We have no eternal allies and we have no perpetual enemies. Our interests are eternal and perpetual, and those interests it is our duty to follow." -- Lord Palmerston (1848)

I. Introduction and definitions

The world has changed a great deal since Lord Palmerston made the above statement while serving as Great Britain's Prime Minister. What has not changed is the idea that nations will always attempt to conduct their foreign policy in a manner that best serves their own interests. This should be no surprise. While we may shake our heads and ask ourselves why France takes a particular stand on an issue or why the Palestinians make a controversial statement, once we look at the issues from *their* point of view, the actions may appear more reasonable.

The fact that actors--be they individuals, sub-state organizations, nations, or multinational corporations--seek to pursue their best interests is not in and of itself interesting or useful. In the international arena, self-interested behavior is the principal assumption upon which the policies of involved actors are based. Each actor will choose and pursue policies based on *their own* calculations of the national interests. It is critical then, to see another actor's national interests through that actors "eyes." To fail in this can lead to gross miscalculation of that actor's policies, actions and reactions.

The concept of national interest is overshadowed in its importance only by its difficulty of definition. Nearly as many different definitions exists as there are theorists who attempt to grapple with the subject. In fact, the difficulty is so great that many academics have rejected the concept completely rather than sink in the potential morass of differing ideas. Still others prefer to use the term "foreign policy objectives" in order to reflect the fluid nature of a nation's changing interests (Holsti p. 124).

Also, the use of any of these concepts *can be* dangerous. This danger stems primarily from the potential for the usurpation of national interests by a narrow constituency or the distortion of the selection process by the same (i.e. interest groups, mass media). If this occurs, the concept can be used to drive the governing powers to actions or policies that are not truly in the national interests, while nonetheless giving those interests as a justification for the policies.

Generally, "interests" or "objectives" are defined in the broadest of terms. This allows policy decisions to enjoy the widest appeal. It becomes much easier for policy makers to "wrap up their advocacy with the suggestion that their particular preferences are in the nation's best interests" (Spainer p.359). Wyllie offers a succinct definition: "…national interest is the basic term deployed by foreign policy-makers to describe the long term, core, collective objectives of the state…. In descending order of priority, the collective objectives are deemed to comprise the

security and survival of the state, economic prosperity, and the sustenance of the social and political values of the society of the state." (Wyllie p.3)

II. Review of the literature

Some look to the writing of Italian statesman Niccolo Machiavelli (1469-1527) for the beginnings of the concept of national interest. In his efforts to promote Italian unity, Machiavelli believed that while a state may have the loftiest of goals, unless that state, has the power to back those goals they are worthless. Many have attributed to Machiavelli the viewpoint: The end justifies the means – as long as the end is *moral* (Roskin p.5).

In his book, On War, Carl Von Clausewitz (1780-1831) writes of the notion that "all state behavior is motivated by its need to survive and prosper." Safeguarding its interests is the only reason a state should go to war. "Unlimited war, however, is foolish, for it serves no national interest" (Roskin p.5).

Roskin refers to the realism of our Founding Fathers as they administered and subsequently expanded the thirteen original states. He points to Washington's farewell address as an example of "shrewd appreciation of national interest: Europe has a set of primary interests which to us have no or a very remote relation. Hence she must be engaged in frequent controversies, the causes of which are essentially foreign to our concerns" (Roskin p.5).

German *émigré* and noted realist Hans Morgenthau (1904-1980) is frequently credited with bringing the concept of national interest into mainstream American thought. He defined interests in terms of power. His test was simple: "was the statesman acting to preserve and improve the state's power?" (Roskin p.7) He rallied support to oppose the Axis powers and later the Soviet Union not necessarily out of moral conviction but because he believed, " International politics, like all politics is a struggle for power" (Roskin p.6).

Political scientist Martha Finnemore, at George Washington University, asserts that most of what happens in the international relations arena today is not about states defending their national interests but about defining them (Finnemore p.ix). As states attempt to determine their place in the "new world order," it becomes apparent just how difficult it can be to pinpoint what their national interests are. The Cold War's East versus West bipolar world has given way to a multipolar world with redefined (often undefined), competing, changing interests.

A state's interests, after all, are what that state says they are today. Indeed, an excellent source to identify the interests of a nation is its local representative i.e. embassy, world headquarters, etc. Generally, the larger the state the more diverse its interests and the more opportunity there is to become involved in conflict. Smaller states with limited resources are less likely to have far-reaching goals. The formulation of specific interests is often influenced by domestic politics, perceptions, values, culture, and ideologies.

The National Interests of the United States - An Example

The DOD Reorganization Act of 1986 (the Goldwater-Nichols Act) requires the President to submit an annual national security strategy to Congress. The 1998 report, *A National Security Strategy for a New Century*, places US national interests into three categories:

> 1. ***vital interests*** – those of broad, overriding importance to the survival, safety and vitality of our nation. Among these are the physical security of our territory and that of our allies, the safety of our citizens, our economic well-being and the protection of our critical infrastructures. We will do what we must to defend these interests, including – when necessary – using our military might unilaterally and decisively.
>
> 2. ***important national interests*** – These interests do not affect our national survival, but they do affect our national well-being and the character of the world in which we live. In such cases, we will use our resources to advance these interests insofar as the costs and risks are commensurate with the interests at stake. Our efforts to halt the flow of refugees from Haiti and restore democracy in that state, our participation in NATO operations in Bosnia and our efforts to protect the global environment are relevant examples.
>
> 3. ***humanitarian and other interests*** – In some circumstances our nation may act because our values demand it. Examples include responding to natural and manmade disasters or violations of human rights, supporting democratization and civil control of the military, assisting humanitarian demining and promoting sustainable development. (pp.5,6)

Considering these broad categories, it is difficult to think of any undertaking that couldn't be "sold" as supporting our national interests. In the case of the United States then, factors such as domestic politics, political will, lobby efforts, military commitments, our value system and many others coalesce into a national policy at any given time.

III. Some Questions to consider

Where are the national interests articulated?

What are the state's professed national interests?

How does that state prioritize its interests?

How are the interests pursued? (militarily, economically, politically)

Who threatens these interests?

Can previous threats to national interests be identified; what was the response to the threat?

What role does regime preservation play in the articulation of national interests?

IV. Discussion of inter-relationships with selected other pol-mil factors

Just as with the other political-military factors outlined in this handbook, wherever appropriate, national interests must be also be analyzed as those interests relate to the other factors. The geography of a given *natural environment* can help determine interests; many claim that future wars in the Middle East will be over water, not oil. What effects do the devastation of the rainforests or over-fishing by huge factory ships have on American national interests? Should the continuing nightmare at Chernobyl concern us?

Political systems and economy are key factors to examine when determining how a state's interests are formulated. Domestic politics and the role of the *media* are components of this analysis. *Leadership, ideology and role of the military* are also important to the analysis of national interests. In the case of Turkey, for example, the secular legacy left by Kemal Ataturk is expected of that country's leaders today and is rigidly enforced by its military.

Your analysis of each factor and its relationship to the others is limited only by the time available. A complete analysis of national interests will include a look at how those interests relate to each of the political-military factors.

V. Summary

National interests can have an impact on the nation in question directly and indirectly. Hypothetically, if Western Europe is a vital interest of the United States, then the Persian Gulf oil fields and sea lines of communications between the Persian Gulf and Western Europe, which the Europeans consider vital to their interests, would also be a vital interest of the United States, albeit indirectly.

Understanding national interests is only the beginning in analyzing why a state acts the way it does. Examining who threatens those interests, and how, is also important. Knowing what a state's interests are can help put into context how that state views itself in the international arena (its worldview) and thus help predict how that state may respond in crises and non-crises.

Chapter 7

Ideology

I. Introduction and Definitions

How nations, societies, and peoples interact with one another is strongly influenced by the values they hold dear. These values provide a sense of right and wrong that contributes to the development of commonly accepted goals and interests. An essential element in any societal value system is its ideology. An ideology can serve to integrate communities, to advance the position of a particular group, and to strengthen the resolve of the people to act to change social, economic, and political systems.

> People with the same ideas about the world, our society, and its values band together. We are attracted by those with similar values and ideas, who like the same things we do, who have prejudices similar to ours, and who, in general, view the world in the same way we do. We talk of "like-minded" people, individuals who share certain beliefs and tend to congregate—in clubs, churches, political parties, movements, various associations, and so on. No matter how independent we claim to be, we all are influenced by ideas. We are sensitive to appeals made to us—to our honor, patriotism, family, religion, pocketbook, race, or class—and we can all be manipulated and aroused. We are creators and creatures of ideas, of ideologies, and through them, we manipulate others or are ourselves manipulated. (Macridis, 1996)

II. Review of Literature

Three sources were useful in the construction of this chapter. *Political Ideologies: Their Origins and Impact*, by Leon P. Baradat provides a comprehensive, chronological survey of the most important political ideologies within the context of significant social, economic, political, technological, historical, and contemporary events. It prepares readers to understand and relate the various political ideologies to the general political values of the left, the mainstream, and the right as they appear in contemporary political events and issues. The author assists the observer to see clearly how political theory applies to his own life.

Contemporary Political Ideologies: Movements & Regimes, Roy C. Macridis and Mark Hulliung, features lucid accounts of the political ideas that define the most important political controversies of our time. Professor Mark Hulliung has prepared a timely revision of the late Roy Macridis's leading text. Five chapters are new to this edition. This sixth edition offers more current analysis of fascism, nationalism, Marxism, anarchism, a historically informed view of multiculturalism and its impact around the world, and a case study of the student movements in the 1960's which shaped the politics of an entire generation now in power. Throughout the text they invite readers to enlarge their understanding of contemporary political controversies by comparing America to European countries.

Contemporary Political Ideologies: A Comparative Analysis, by Lyman Tower Sargent. This book introduces the dominant (and some of the minor) political ideologies of the modern world. Besides providing a comparative study of nationalism, democracy, feminism, Marxism, and Islam, Sargent also introduces readers to such ideologies as anarchism, liberation theology, environmentalism, fascism, and national socialism. The result is a thorough exploration of how political ideologies affect the way people think and governments act. Through his comparative approach, Sargent looks at each ideology from a variety of perspectives - presenting the arguments, positions, and counter-positions of each, including its roots in current political debates. The book emphasizes the link between recent world events and political ideologies by including updated coverage of the impact of nationalism, democracy, Islam, feminism, and the Green Movement.

Ideology Defined

There are as many definitions of ideology as there are ideologies and students of ideologies. How the concept is defined depends in large measure on what's being accomplished.

For analytical purposes, ideology is an emotion-laden, myth-saturated, action-oriented belief system accepted largely on faith as truth or fact by a group or people. It is composed of a set of attitudes toward the various institutions and processes of a society. By emotive symbols, it economically and efficiently spells out what is valued and what is not, what must be maintained and what must be changed. It provides believers with a particular picture of the world both as it is and as it should be. Additionally, some ideologies may have established rules or behavior that believers must follow to obtain and sustain this new picture of the world. In so doing, it organizes the tremendous complexity of the world into something fairly simple and understandable. This world-view is normally skewed, thus overemphasizing one or a few aspects of society while slighting or ignoring others. In contrast to philosophy, theory, and religion--which are concerned with knowledge and understanding or with personal, private matters--ideology incites people to and provides the basic framework for social and political action. In this sense, it is a "mobilized belief system." (Sargent, 1996, pp. 2-3; Macridis, 1996, p. 8.)

Maxwell Taylor, Chair of Applied Psychology at University College in the United Kingdom, has applied a behavioral approach to his definition of ideology.

> Ideology provides the linkage for people to unite under a common dimension and provides the framework for particular kinds of people to come together. Geographically or racially based ideology might be termed nationalism and uses, as its principal attribute of both membership and concern, reference to that geographical or racial grouping. Ideology might also link together, however, more conceptually defined groups; religious ideology, for example, addresses a very broad spectrum of people - class-based religious ideology would be one example of this. In this sense, therefore, ideology defines a group to which the member can belong. It might be an ill defined conceptual group, like the member of a class, or it might be a very particular physical group, like membership of a

church or club, that meets regularly and provides a focus for social activity. (Taylor, p. 89)

One of the most important issues to consider when it comes to analyzing an ideology is that the political-military officer must be able to distinguish between a philosophy and an ideology. Philosophies tend to be profound, personal, and encourage introspection. An ideology on the other hand is the tool from which a philosophical belief becomes realization. Five points to remember in defining and analyzing an ideology are: an ideology is a political term; it consists of a view of the present and the future; it is action-oriented; it is directed at the masses; and it is usually explained in simple terms so that it can be understood by all.

Major Themes Found in Ideologies

To analyze an ideology, look at its scope, its focus, and how it addresses several critical societal issues. The scope of ideological goals may be limited (e.g., women's rights, pro-life/pro-choice) or holistic (e.g., Marxism-Leninism, Confucianism). Similarly, ideologies may be social, economic, or religious in nature. However, regardless of scope, all ideologies will have a political component, since it is generally through the political system, or by its downfall, that ideological goals will be achieved. When speaking of ideology, you should speak of it in its political sense. Therefore, make your context known.

Next, determine the ideology's focus. Identify the crucial component that must be present or developed as a prerequisite for achieving the ultimate goal that the ideology establishes. For example, a religious-based ideology will stress man's relationship with his deity and will exhort adherents to mold society to meet the deity's desires. Similarly, fascism stresses the supremacy of the State; Marxism-Leninism-Maoism, society as a whole; Confucianism, the family; and democracy, the individual.

The focus and scope of an ideology will determine how it will address five major questions or themes.

First, is the role and the nature of the individual in a society. Is there such a thing as human nature? If so, is it good or bad? Should it be developed or restrained? Do people have natural, inalienable, "human" rights? Is there such a thing as a person outside the group (tribe, state, or party), or is man strictly a social being? Is the individual supreme or is the group?

The second theme is the nature of truth and how it can be discovered. Is truth unchanging? Can it be known to all or only to an elite to whom the rest of us must submit? Has the truth already been discovered? Is there more?

The third theme is the relationship between the individual and the group. Some social scientists have no concept of individuality and see an individual as part of the group. As a member of a group an individual is helpless without the protection and cohesiveness of the group. Other scientists believe that the group is made up of individuals and must submit to individual rule when it comes to property rights and security.

The fourth theme is political authority, which is related to the role of the individual and the nature of truth. An elitist will say that authority is important and that those who are privy to the truth must be obeyed. Those who accord supremacy to the individual and feel that all can find the truth will say that political authority must be limited so as to allow for full expression and participation by the individual.

Finally, the fifth theme relates to property rights versus personal rights. Which is more important, material and economic equality or legal and political equality? How does mankind resolve the inherent conflict between liberty (which allows for aggregation of property), and equality (which says all should get their fair share)? Is "equality of opportunity" sufficient and, if so, what exactly does it mean? Does property include such things as education, health, access to transportation and communication, unemployment benefits, etc.? Are freedoms negative or positive? Which freedoms are most important; e.g., freedom from hunger vis-a-vis freedom of religion?

Ideological Functions

Ideology may have several functions. First, it can legitimize or delegitimize a political regime. It can protect or restore a political system or change or destroy it. It can rationalize the status quo or challenge it. It may also justify the imposition of one political order on another deemed inferior, or can defend the right of a group to autonomy or self-determination in establishing its own order free of outside interference.

Ideology can enhance or weaken social stability. It can bind a community together or rend it apart based primarily on a model proposed by Roy Macridis.

Macridis has designed four criteria to help identify an ideology.

- **COHERENCE**. Look at the overall scope of the ideology, its internal logic and structure. How does it view the social, political, and economic systems in the society? Does it have clear goals and strategies? Does it have several goals or just one or two? What type of movement or party does it call for?

- **PERVASIVENESS**. How long has it been around? How has it changed over time? How does it differ among groups or among societies?

- **EXTENSIVENESS** of the ideology. How many people believe in it? Who are they? Does it cut across class, ethnic, and regional lines or is it limited?

- **INTENSITY** of the ideology, the degree and depth of its appeal. Does it call for rigid discipline among its adherents? What levels of commitment, loyalty, and determination are demanded? In many cases, a highly motivated, disciplined minority may be more powerful (or more threatening) than a large apathetic majority.

These criteria are fine as far as they go, but there are other considerations:

? First, a single ideology does not dominate an entire society. There are numerous ideological influences at work in all societies. Components of these ideologies (or within one ideology) may be inconsistent and in conflict with one another. To understand the ideological influences in a given society, be sure to look at all the ideologies at work in it.

? Second, because there is more than one ideology in any society, it follows that people in that society will be influenced by more than one ideology simultaneously. There are Confucian Marxists in China, Marxist Democrats in the United States, and Confucian Democrats in Japan, though none of these three ideologies seems logically compatible with the other two at first glance. As if this were not enough cause for confusion, keep in mind that people will not always act in accordance with the ideology they espouse. Ideology inclines people to act in a certain way; it does not dictate it.

? Finally, no single ideology is monolithic--no matter how coherent it may seem to be. There will always be factions and disagreement among believers as to the "true meaning of the word," which, if nothing else, will cause the thrust of the ideology to change over time.

The "Political Spectrum"

A convenient way to categorize ideologies or factions is to determine where the ideology falls on a political spectrum (Figure 1). It is this technique that is used in classifying a group or ideology as 'leftist" or "rightist." (These terms come from French royal political tradition where those members of the French court who generally supported the monarch sat to his right and those opposed sat to his left.) We can use the political spectrum technique to look at differences—

? Among ideologies in the abstract (e.g., Jeffersonian democracy versus communism).

? Within an ideology (e.g.. communism in the former Soviet Union, Albania, Italy, El Salvador, etc.).

? Among ideologies in a single society or country.

? Within one ideological party or group.

The political spectrum acts as a tool to determine the attitudes of the group or ideology about the desirability, direction, depth, speed, and method of change. Those people who fall toward the ends of the spectrum tend to advocate extensive, pervasive, rapid change through whatever means necessary, including violence. Similarly, those toward the middle of the spectrum promote moderate, incremental change through generally legal and/or nonviolent means.

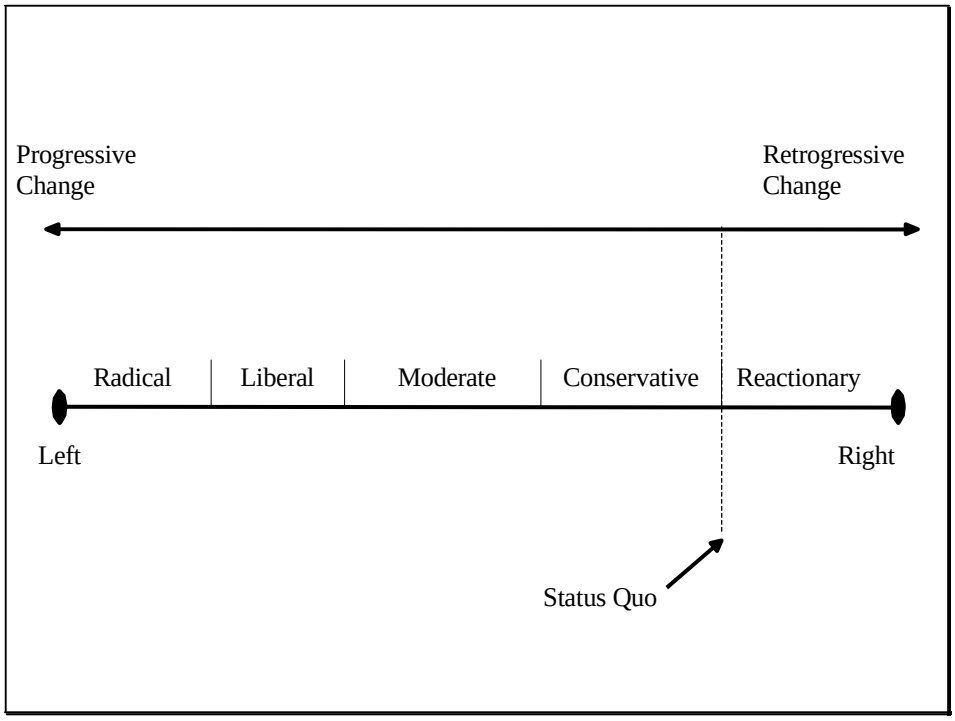

Figure 1

Moving from left to right across the spectrum, several familiar and generally misunderstood labels can be noted. Keep in mind that these labels are simply tools of analysis and are not intended either as pejorative or complimentary. Similarly, where an individual, group, or ideology falls along the spectrum will be determined by the context within which we are working. A liberal in our country may be a flaming radical in another, while a conservative in one party may be a reactionary in another. Furthermore, keep in mind that a person may hold liberal views on one issue and conservative views on another. Finally, where someone lies on the spectrum may change over time as society changes.

With these caveats, let us now define our labels.

- A radical is someone who is extremely dissatisfied with the social, political, and/or economic system. He favors revolutionary change, that is, change that is profound and fundamental. This does not mean that he advocates violence, though some radicals--those on the far left of the spectrum--do. Mohandas K. Gandhi and Martin Luther King are examples of nonviolent radicals.

- A liberal is someone who is generally satisfied with the basic structure of society, but sees substantial room for improvement. He tends to favor rapid, far-reaching change, usually instituted within the framework of the law.

- A moderate is essentially pleased with the system, but sees that some things can and should be changed. These changes are but minor adjustments accomplished by using existing procedures.

- A conservative is most content with the status quo. While his viewpoint is progressive (as opposed to retrogressive), he does not want a lot of change. He looks suspiciously on solutions that discard tried and true techniques for new and innovative procedures. A conservative values social, political, and economic order over change. This does not mean he is against change, only that he feels it should be done cautiously.

- A reactionary is someone who advocates retrogressive change as opposed to progressive change. He harkens back to a bygone era and wants to revive the "good old days." As with radicals, reactionaries are not necessarily violent, though those at the far right may well be so. For example, Confucianism is a reactionary ideology that views violence with distaste. On the other hand, several white supremacist movements in the United States hold an ideology that not only condones violence but also encourages it. To reiterate, people who fall at the extremes of both ends of the spectrum will call for deep, rapid, sometimes violent change, although the types of change and its objectives may differ.

- An additional term that does not appear on the political spectrum, but can fall at either end of the spectrum, is that of the fanatic. Contemporary use of this term describes an individual or group, whose behavior is excessive to the point of being considered abnormal, implying a focused and highly personalized interpretation of the world. In a political sense, it is behavior which is strongly influenced by and controlled by ideology, where the influence of ideology is such that it excludes or attenuates other social, political or personal forces that might be expected to control and influence behavior. (Taylor, 1991, p. x)

Three Broad Categories of Ideologies

In looking at the political spectrum the analyst can place ideologies into three broad categories:

- **Status quo** ideologies wish to keep and defend the current economic, social, and political order within a given society.

- **Radical** or **revolutionary** ideologies suggest major changes to the existing social, economic, and political order.

- **Reformist** ideologies fall between the status quo and radical or revolutionary ideologies.

It is important to understand that categorization of ideology is chronological. Communism in the Soviet Union was *revolutionary* in the beginning but once it established itself it sought to maintain the *status q*uo. One generalization to remember is that any ideological movement that challenges the *status quo* will more than likely use force to promulgate change in the social, economic, or political system.

III. Questions to Consider

Does the ideology answer the five major themes that an ideology must address? Look for the role and nature of the individual in the society, the nature of truth, the relationship between the individual and the group, the role of political authority, and property rights versus personal rights.

Does the ideology meet the functions and criteria that Macridis discusses? Determine if the ideology legitimizes or delegitimizes the political regime, does it protect or destroy the political system, does it suggest that one political regime is better than the other, will it enhance or weaken social stability. Determine if the ideology meets the four criteria of coherence, pervasiveness, extensiveness, and intensity.

Where on the political spectrum does the ideology fall? Determine where on the political spectrum the ideology falls and whether or not it deviates from its origination.

Does the identified country have more than one ideology? Complete domination by one ideology is virtually nonexistent and no ideology is monolithic.

Does the ideology propose violent or militant behavior? An example of this would be the Nihilist ideology, an ideology proposed in 19th century Russia advocating revolutionary reform and using terrorism and assassination. A more contempory violent ideology would be that of the millenarian ideology of Aum Shinrikyo in Japan.

IV. Conclusion

The process of identifying and analyzing an ideology can be a complex task. Only through further study and research can the political-military officer gain the knowledge needed to analyze an ideology of a given movement or nation. Ideology is a societal value and the failure to analyze its effect is on a given society is tantamount to failure. Wars have been fought, governments toppled, and great personal hardships endured all in the name of ideology. It is not only a societal value, but a significant social force as well.

Chapter 8

Political Systems

I. Introduction and Definitions:

This chapter presents models for analyzing a country's political system. The review of the literature presents several common approaches to analyzing how a political system works. The next section describes several common governmental and electoral models, and discusses how the organization of the government affects a nation's political process. This is followed by a brief discussion of the dimensions of a nation's political climate. Finally, a model for predicting political outcomes is presented.

Many definitions of key terms will be offered throughout the chapter. However, it would be useful to start by defining some basic terms. The following definitions of key concepts are provided by Mayer, Burnett and Ogden (1996):

Political System: Those structures and processes that determine with accepted authority who gets how much of the things people value. The parts of the nation-state are part of the political system but so are structures and processes not part of the nations state**.**

Nation: A large group of people sharing a common sense of belonging, a common peoplehood. This may include a sense of community (defined below).

State: "The legal entity that exercises sovereign power over a given territory. The state may or may not coincide with the nation."

Community: "A set of individuals, usually a nation as defined above, who share, in addition to a sense of common peoplehood, a set of basic values."

Legitimacy: "Authority which is widely accepted as rightful. This acceptance is above and beyond whether there is of the performance of the system with regard to particular issues."

Sovereignty: "An essential property of a state that refers to the final or ultimate legitimate power to make and enforce rules for the society."

Political effectiveness: "The ability of a political system to resolve important issues to the satisfaction of the dominant parts of the population so as to minimize challenges to the system itself. Political systems maybe effective without necessarily being either democratic or just."

II. Review of the Literature:

Traditional Approach: The traditional approach to analyzing political systems was to dissect their formal governments. That is to say that the analysis focused on the state to exclusion of the nation. This approach was criticized for paying to much attention to legal procedures and governmental institutions and not enough attention informal processes and non-governmental groups (Chilcote, 1994). This shortcoming was especially relevant to developing nations as they had less developed formal institutions (i.e., political parties) and more varied governmental

structures. However, as the nations of the world have developed more formal political systems that are organized along similar lines, there is renewed interest in the traditional approach.

Structuralist Approach: Structuralists view politics, and indeed most human activity, as a struggle between different groups in the society. They see the society as a hierarchal structure of horizontal groups (e.g., classes, gender, religious groups, ethnic groups, etc.). Structuralists view the political, economic, and cultural systems as means for the group at the top to maintain its position. The state is thus simply a tool of the dominant social group and can only be analyzed in the context of the larger social structure and politics can only be understood as part of a larger social struggle.

There are various structuralist models but the Marxian model is the most common. A careful distinction must be made between a Marxian and Marxist approach. The Marxist approach is based on the political ideology (and dogma) of people who self-identified themselves as "Marxists" or "Marxist-Leninists". Generally this approach was based on the predictions of the future contained in *Das Kapital* and the political prescriptions offered in the *Communist Manifesto.* The Marxian approach is based on the manner in which Marx analyzed political systems as best exemplified in the less well-known *18th Brumaire*. Thus this approach is based on Marx's methodology not his conclusions. For instance this approach will see political issues as matters of class conflict, but will not assume that revolution is the only way these conflicts will be resolved.

The Marxian approach focuses on the socio-economic class structure of a nation. It analyzes the state in terms of the role it plays in advancing or protecting the interests of the dominant class. This approach also places great emphasis on the role of the state in economics and on the role of social institutions on supporting the status quo. Chilcote (1994) provides an overview of Marxian comparative analysis.

Economic Base:

Mode of Production- the forces and relations of production employed by a society at a given time. (e.g., feudalism, capitalism, socialism)

Forces of Production- the productive capacity generated by the physical capital, human capital and technology possessed by the society.

Relations of Production- the division of labor and property rights in the society or how production is organized in the society, particulary with regard to ownership of the means of production.

Means of Production- the physical capital, i.e., land, tools, buildings and machinery, that workers use to produce goods.

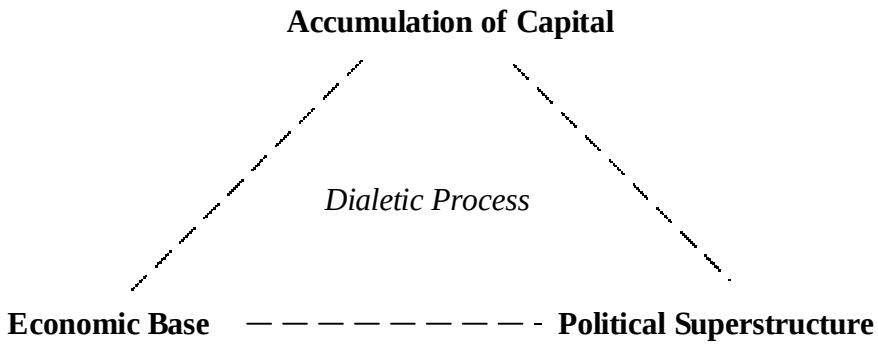
Political Superstructure:

State- the legal forms and instruments that maintain class rule

Class- large groups of people who are distinguished by their relationship to the means of production, and their role in the relations of production.

Ideology- legal, political, religious, and philosophical symbols which support class rule.

Figure 4-1: Chilcote's Marxian Model



Source: Adapted from Chilcote 1994, Figure 9.1

Class Analysis: Classes need to be identified by their role in the mode of production and thus each society may have a unique set of classes. Any class may be dominant at one point in history and then subordinate in another. Marx identified three classes in terms of their relationship to the means of production:

Workers(Owners of labor): People who do not own means of production, but have only their skills with which to make money. Their bargaining position vis-a-vis other classes depends on the abundance their skills relative to the demand for them.

Landowners (*Owners of Fixed Capital*): People who own land or more generally any physical means of production which is in finite supply. Membership in this class will be limited by the supply of land. The distribution or redistribution of fixed capital will be highly conflictual since it is by definition a zero sum situation. That is, for one person to gain land, someone else must lose it.

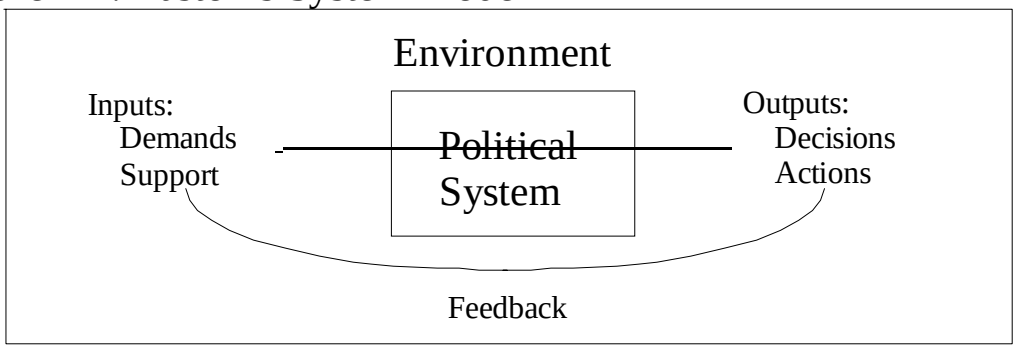
Capitalists (Owners of Reproducible Capital): People who own physical means of production that can reproduced such as machinery, buildings. The supply of this type of capital is not limited and the class may grow.

Dialectics: This is a theory of change based on conflict. The idea is that there is a state of the world (thesis) that generates opposition which is essentially support for negating the state of the world (antithesis). From this competition, some new state of the world emerges (synthesis).

Accumulation: The accumulation of capital or wealth is the ultimate outcome of economic activity. The size and distribution of the accumulation is highly dependent on both political and economic issues.

Functional or Systems Approach: Political systems can be analyzed and compared in terms of how they perform certain functions common to all systems. Easton (1953, 1965) modeled a political system in terms its inputs and outputs. He argued that a political system exists in an environment which places demands upon it and from which it draws support. From these inputs the system generates outputs in the form of decisions and actions. The environment absorbs these outputs and then generates feedback in the form of new demands and support. Figure 4-1 illustrates Easton's model.

Figure 4-2: Easton's System Model



Almond and Powell (1966) built on Easton's work by focusing on the functions and capabilities of the political system. Their structural-functional approach analyzes the political system in terms of how it performs certain function involved with absorbing inputs (input functions) and generating outputs (output functions). They define politics as activities associated with authoritatively controlling the behavior of a particular set of people within a particular geographic area through means that include the use of coercion. (Almond and Powell, 1996, 28)

Politics is not restricted to the state. Rather the state is part of a larger political system which Almond and Powell define as "...a set of institutions concerned with formulating and implementing collective goals of a society or of groups within it."(Almond and Powell, 1996, 28-29). This definition contains the following three critical concepts:

System: an object with moving parts that interacts with its environment
Structures: institutions set up to carry out specific activities
Functions: types of activity

To analyze a system, Almond and Powell use a structural functional approach. They define a generic political system in terms of the functions it must perform. Particular systems are analyzed by determining what structures perform each function. The functions are broken into three categories and are listed below.

Process Functions:
Interest Articulation: the expression of demands for policy to change or remain the same.
Interest Aggregation: the transformation of demands into policy alternatives
Policy Making: selecting between available policy alternatives
Rule Application: implementing a chosen policy

Rule Adjudication: resolving conflicts that arise from policy

System Functions:
Socialization: teaching values and norms to members of the society
Recruitment: the selection and inducement of individuals to fill specific roles in the political system.
Communication: the transmission of political information, issues and ideas.

Policy Functions:
Extraction: the collection of resources from the group or society.
Distribution: the use of resources for the benefit of members of the group or society.
Regulation: the enforcement of rules.
Symbols: the expression or affirmation of values held by the group.(not in A&P)

As defined, systems exist and interact with their environment. Since politics is a human behavior, the environment is largely understood to be the society in which the poltical system resides. One of the most relevant attributes of the society is its political culture which Almond and Powell define as the "... collective political attitudes, values, feelings, information and skills of the people in a society..." (Almond and Powell, 1996, 43). The following three aspects of the political culture are of primary importance in analyzing the political system:

System Propensities: acceptance of the system's values and organization
Process Propensities: attitudes towards participation (Participant, Subject, Parochial)
Policy Propensities: expectations of government's goals and methods.

Understanding these propensities among the people in the political system is critical to understanding the demands the society places on the political system and how it evaluates the system's performance.

III. Governmental Organization

Governmental Models:

Increasingly, civilian governments have become organized on similar lines. Almost all have a parliament, a chief executive and cabinet in charge of the bureaucracies, and a head of state who is the symbolic leader of the country. Governments differ primarily in how people are chosen to fill these roles and whether there is a separation between the parliament and the chief executive and cabinet, and between the chief executive and the head of state.

Pure Parliamentary (British) Model: In this model the chief executive (usually called the Prime Minister) and cabinet are selected by the majority party or a coalition of parties with a majority of seats in the parliament. The chief executive may or may not be the head of state. If there is a separate head of state, the office is largely ceremonial. In many European, the royal family acts as head of state. Ireland elects a President who has virtually no political power. In many commonwealth nations, the Queen (King) of England is the titular head of state and the British Governor General performs many of the day to day functions of head of state.

In the pure parliamentary model, the ruling party's power is not limited by governmental check and balances but by electoral and party checks. In such systems, if the government fails to win an important vote (i.e., a "vote of confidence") in the parliament, then the government is dissolved and new elections are called. Thus, the government is restrained by the opposition party and by its own rank and file membership. Otherwise, it has complete control over the state. For this reason, this model is usually chosen by nations with a sense of community such that they don't fear giving the "other" parties or groups unfettered control of the state.

Mixed Parliamentary (French) Model: Here, the prime minister and cabinet are selected from parliament but a president is elected separately. Generally, the prime minister functions as the chief executive and is in charge of most of the bureaucracies. The ministers of each bureaucracy are chosen from the parliament and continue to serve as members of parliament. The president functions as head of state and has control of the foreign ministry and military. In such systems, the president very often has some influence on parliament (i.e., he or she may be able to dissolve the parliament and call for new elections). A president in such a system may have considerable power to rule directly. He or she may be able to bypass parliament by calling for a referendum on a particular issue. Some presidents have the authority to declare an "emergency" and rule by decree for limited periods of time (usually subject to parliamentary approval after the fact).

In this system, the ruling party has control of both the parliament and bureaucracy, but may or may not have control of the presidency. Thus, the government may be divided with a president from one party, and a prime minister and cabinet from another. In such a case, the division may act as a brake on rapid policy change. However, if there is no majority party in parliament and there is difficulty forming a coalition government, the president may act as a stabilizing influence and source of policy guidance. For this reason, this model has often chosen by nations with a more divided sense of community such that political turmoil was expected.

Pure Presidential (U.S.) Model: Here the chief executive is directly elected and is, generally, the head of state. The bureaucracies are completely separated from the parliament. The president selects ministers (secretaries) to run the bureaucracies and, while serving, those ministers are not members of parliament (congress). Though presidents in this system have control over executing policy, they have far less formal power than prime ministers in either parliamentary system, and far less discretionary power than presidents in the mixed parliamentary system. However, presidents in the pure presidential model are far more independent of their political parties than are prime ministers. After all, prime ministers owe their office not to the voters, but to the other members of parliament from their party.

Electoral Models:

There two essential components to an electoral system. The first is the selection of candidates from which voters will choose, and the second is the selection of the officeholder from the pool of candidates. All the methods of selection can be characterized by the relative influence of masses versus elites.

Selection of Candidates: One of the most universal functions of political parties is the selection of candidates for office. In most systems, political parties are allowed to choose candidates by their own internal process. The mass of party members may or may not have a role

in selecting the candidate. Petitions and primary elections are the most common means of mass participation in the selection of candidates. More often, the task of selecting candidates is given to the party leadership or governing structure.

Selection of Officeholders: Though electoral systems vary considerably, there are three predominant models in use around the world.

Single Member Districts: In this system, each officeholder represents a geographic region and is selected on an individual basis. Voters in that district pick one candidate, by name, to hold office. In such cases the individual officeholders are beholden to their district's electorate for their jobs.

Single member district systems can be divided into plurality or "first past the post" systems, and majority or "run-off" systems. In plurality systems, the candidate who gets the most votes, whether or not its a majority of votes, wins. This system is used to elect member of Congress in the US and members of parliament in Britain. This system will generally favor the rise of two predominant political parties over smaller parties. Also the parties in this system will tend to converge towards the center of the political spectrum. As a result there will be less difference between policies of different parties, and more emphasis of personalities than in other systems.

In the majority system, a candidate must receive a majority of the votes cast to win. If no candidate wins a majority, then a run off election between the two lead candidates is held. This system is used in some state governments in the US and to elect the president in France. In this system, small parties can be influential by preventing a candidate from larger parties from winning a majority and then demanding concession in exchange for its support in the run off.

Proportional Representation: In this system, multiple are to be selected (i.e., the members of parliament) and the electorate votes for a party not for a candidate. The offices are then distributed among the parties in proportion to the votes they receive. That is, if a party receives 55% of the votes cast in the nation, it will receive 55% of the seats. The party then selects individuals to fill those seats (or offices). Thus, officeholders do not represent specific regions and they owe their job more to the party than the electorate.

This system favors the rise of more parties than the single member district system. This is because a party that party receives 10% of the nationwide vote in a single member district system (especially a plurality based one) will probably never win a seat in the parliament. However, in a proportional representation system, it will receive 10% of the seats. Because geographic distribution of this 10% is irrelevant, party lines will be drawn more along ideological, socio-economic or religious divisions, as opposed to geographic divisions of the electorate. Furthermore, since officeholders are not selected by name, party policy issues are more important to the voters than are the individual officeholder's views, character, or seniority. This also leads to greater cohesion and discipline within each the party. It also leads to a greater difference in policy position between parties.

List Systems: In these systems, the electorate chooses multiple officeholders by name from a list of candidates. Parties may determine what candidates are on list, but the voters choose which candidates hold office. Therefore, unlike the proportional representation system,

officeholders are beholden to both the voters and the party. Also, because voters choose officeholders by name, the individual characteristics of the candidate are more relevant in this system. However, unlike the single member district system, in this system, voters may split their vote among two or more parties. Thus third parties, especially those with charismatic candidates, are more likely to rise in this system. However, if the districts are not national, these parties need not be national in their appeal and thus there may be a scattering of "independent" candidates throughout the system. This system is commonly used to elect town or city councils in the US and in China.

IV. Political Climate

The political climate refers to the relationship between the citizens and the government, more specifically, to the degree which each influences the other. Thus, the climate is characterized by the nation's existing level of democracy and civil liberty. Democracy may be defined as the ability of the citizens to influence government composition and behavior. Liberty may be defined as the inability of the government to interfere in the personal lives of its citizens.

Legitimacy:

Legitimacy is often referred to as the acceptance of a system's, usually the state's, right to make authoritative decisions (Mayer, Burnett, and Ogden 1996). Thus legitimacy is a matter of perception on the part of individuals and can be measured in terms of its *universality* (i.e. what percentage of the group accepts the system's right to make decisions for them). However, an individual may accept a political system's authority over one issue but not another. Therefore, legitimacy must also be measured in terms of its *scope* (i.e., the set of issues over which members of the group accept the system's authority). For instance an individual may accept the government's authority to collect taxes, conscript for the military, and to convict murders while not accepting its right to determine whom they may marry, what religion they practice or what they wear. Of course, legitimacy is not limited to the state. Individuals might accept the right of their family to make decisions over certain issues (e.g., whom they marry) and of their employer to make decisions over others (e.g., what they wear).

Strictly speaking, legitimacy is a normative concept based on the population's judgements of what it is right and wrong for the state, or any other political system, to decide. That is to say that legitimacy is the range of issues over which the people think the state should decide, not the issues over which it actually decides. Therefore when looking to measure legitimacy, one must look at people's attitudes towards the government (and/or actions which reflect that attitude) rather than at the government's actions or inactions. To understand the source of a government's legitimacy, one must consider the factors which would weigh on an individual's judgement, i.e., ideology, religion, culture, the government's political effectiveness, and the presence and perceived effectiveness of available alternative political systems.

Liberty:

Liberty is the individual's actual freedom from governmental influence. Very often it is defined in terms of the issues which an individual is free to chose for himself, i.e., what religion to practice, what job to have, what clothes to wear, when to get up in the morning, what to think, whether or not to wear a seat belt, etc. At one extreme there is anarchy where individuals are free

to decide all issues for themselves. At the other extreme is totalitarianism, where individuals are not allowed to decide anything for themselves. These theoretical extremes do not exist in reality but have been examined in literature in William Golding's *Lord of the Flies* and George Orwell's *1984*. In between these extremes, nations have various ranges of issues over which the individual is free to choose and this range is the nation's liberality.

Unfortunately, liberality is not a linear function between two extremes. In the west women are free to drive cars but not to drive or ride in them without a seat belt; while in some countries women may not drive cars but are free to not wear seat belts when riding in them. Determining which of these countries is more liberal depends on which of these issues one thinks is more important. From a western point of view, the comparison is ridiculous, but from another culture's point view, it may be very apt. Thus, measuring liberty in a meaningful way depends upon the normative point of view of the person doing the measuring. This does not mean that one can't measure liberty, but that the measure will not be objective or universally accepted.

Democracy:

At its roots, democracy means the involvement of the mass public in government. Given the interpretation of political systems as processes, scholars have typically defined democracy in procedural terms. Schmitter and Karl (1996) offer the following definition:

> *Modern political democracy is a system of governance in which rulers are held accountable for their actions in the public realm by citizens, acting indirectly through the competition and cooperation of their elected representatives*. (p. 50; italics in original)

There are several key aspects of this definition. First, it places an emphasis on rulers being accountable as opposed to being selected by the citizenry. Second, it requires that the accountability be in the public realm so that the accounting is acknowledged and visible. Third, it requires that the accountability be to the citizens at large where citizens are understood to be most of the adult population. Fourth, it allows that rulers will be indirectly, and thus imperfectly, accountable through a competitive political process.

V. Predicting Political Outcomes: The Median Voter Model

Most models of political systems seek to explain or describe the systems origins, structure and/or function. Few, however, seek to predict the outcome of the system's decision making apparatus. Thus, these models are good at explaining how a decision is made but not at predicting what decision will be made. However, there are models that forecast political decisions in most types of political system. The most widely used of these is the Median Voter Model. The model is based on the following proposition:

Median Voter Theorem: When voting by simple majority over a single issue, if the policy alternatives can be ordered from left to right and voters are placed on this spectrum according to the location of their ideal policy, then the policy of the median or middle voter will be chosen

Bueno de Mesquita (1984, 1996; Bueno de Mesquita, Newman and Rabushka, 1985) has

used this theorem to create a model for forecasting political outcomes. Though it is a “voting” model it has been applied to non-democratic as well as democratic decision making bodies. There are four steps in using the model as listed below. To use th model

Identify all Stakeholders: A stake holder is defined as any group with an interest in the decision. The premise here is that any group that stands to lose or gain from a decision may try to influence that decision. The model takes a broad view of the political system in that stakeholders do not need to be part of the formal political system. They just have to be effected by the outcome. Bueno de Mesquita (1984) uses this model to predict the policy of Iran after Khomeini’s death (Khomeini was still alive at the time). Bueno de Mesquita asked a group of area experts to identify the stakeholders on several issues. The experts identified the groups listed in table 4-1 (note: relative influence is explained later).

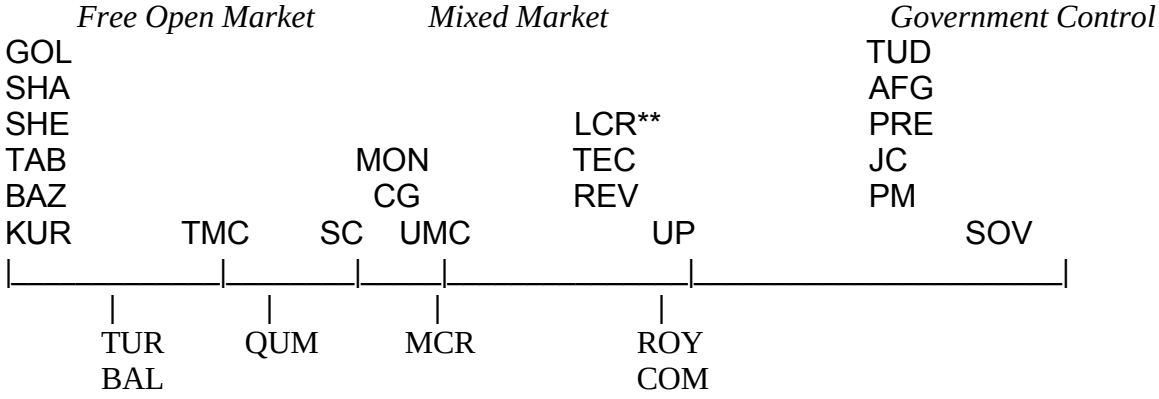
Table 4-1: Stakeholders in 1984 Iran

Group	Relative Influence	Group	Relative Influence
Afghan Refugees (AFG)	0.5	President Khamenei (PRE)	10.7
Tudeh Party (TUD)	0.6	Prime Minister Musavi - Khamenei (PM)	9.0
Kurds (KUR)	2.3	Tehran Militant Clerics (TMC)	3.4
Turkoman (TUR)	0.3	Qum Clerics (QUM)	4.5
Baluchis (BAL)	0.6	Supreme Court (SC)	4.5
Royalists (Roy)	0.2	Aaytollah Montezari (MON)	0.1
Bazaaris (BAZ)	5.6	Revolutionary Guards (REV)	12.4
Middle Class Rural Peasants (MCR)	0.9	Committees/Cabinet (COM)	11.8
Lower Class Rural Peasants (LCR)	4.5	Council of Guardians (CG)	9.0
Urban Middle Class (UMC)	1.1	Ayatollah Golpayegani (GOL)	0.6
Urban Poor (UP)	4.5	Ayatollah Shariat Madari (SHA)	0.6
Technocrats (TEC)	0.6	Ayatollah Sherazi (SHE)	0
Junior Clerics - Rafsanjani (JC)	11.3	Ayatollah Tabot Tabai (TAB)	0
		Soviet Union (SOV)	0.6

Source: Bueno de Mesquita 1984 231

Identify each stakeholder's Position: Each stakeholder's ideal policy on each issue under consideration must be identified. The stakeholders are then placed on a policy spectrum (i.e., a line) according to their position. With regard to the government's role in the economy, Iranian stakeholders were organized in the following way:

Figure 4-3: Economic Policy Spectrum in 1984 Iran



Cumulative Distribution of Influence:

9.1 10.0 13.4 17.9 22.4 32.6 33.5 55.5* 67.5 100.2

Source: Bueno de Mesquita 1984 234

Determine each stakeholder's Influence: The next step is to determine each stakeholder's influence over the decision making process relative to the others. When predicting the outcome of democratic decision making process, the percentage of votes each group controls is usually a good measure. For other processes, an estimate is made about how much influence each group has relative to that of the others. Bueno de Mesquita (1984) aggregated the subjective estimates of his panel of area experts to determine the relative influence of each group as listed in table 4-1. The numbers represent the percentage of influence possessed by each group.

The information about influence is used to "weight" each group according to it's influence. Starting from the one side of the policy spectrum in figure 4-3, each group's influence is added up to produce the cumulative distribution listed below the line in figure 4-3. The group or groups whose ideal policy is at the point where the distribution is equal to 50% is the median party. In this case, the position is shared by the Lower Class Rural (LCR), Technocrats (TEC), Revolutionary Guards (REV), and Urban Poor (UP). The model predicts that their favorite policy (a mixed economy with fairly heavy state involvement) will be implemented.

Determine each stakeholder's Salience: A stakeholder's salience is the degree to which a particular policy issue is important to the group. Each group's salience is considered to determine how much effort they will expend to achieve their ideal outcome on a particular issue. In the example of 1984 Iran, the urban poor (UP) and lower class rural (LCR) were estimated to have a much higher salience for the economic issue than the revolutionary guards (REV) and technocrats (TEC)(Bueno de Mesquita 1984). Therefore, one could predict that the urban poor and lower class rural would be more active in pursuing their economic goals (i.e., might form a coalition) with perhaps only tacit support from the technocrats and revolutionary guards.

There are several important points to take from this model. First, control over policy is as much a matter of position as power. Groups with seemingly little political power may determine the outcome by virtue of the position they hold vis a vis the other groups. Groups with a large share of the political resources may be ineffectual because their policies are too extreme. Second,

the median is a relative position based on the positions and power of all the groups. Thus the median position is not necessarily a centrist position. If a group, or set of groups, on one end of the country's political spectrum held 50% or more of the political resources, then they would be the median voter. Third, because groups hold different positions on different policies, the median group changes with each issue. However, there are usually one or two issues that dominate the political system, and the position of groups on these issues determines what coalitions are formed.

Chapter 9

POLITICAL ECONOMY

I. Introduction and definitions

Political economy is often defined as a study of the relationship between politics and economics. J. Stuart Mill's followers describe political economy as a deductive science, drawn from assumption; while the school of David Ricardo considers it an inductive science, built upon elementary facts. A third school of political economy to which belong August Comte and Daniel Webster, argues that Political Economy is only an assemblage of truths; therefore, not a science because of its lack of law or principal. The simple premise of recognizing the reciprocity between economics and politics leads us to ask the following question: what is political economy?

"On the one hand, politics largely determines the framework of economic activity and channels it in directions intended to serve the interests of dominant groups; the exercise of power in all its form is a major determinant of the nature of an economic system. On the other hand, the economic process itself tends to redistribute power and wealth; it transforms the power relationships amongst groups. This in turn leads to a transformation of the political system, thereby giving rise to a new structure of economic relationships. Thus, the dynamics of international relations in the modern world is largely a function of the reciprocal interaction between economics and politics." (Gilpin, 1975, pp. 21-22).

In studying political economy, the following concepts defined by Johnson (1996) are important:

Aggregate demand

"Also more accurately referred to as *aggregate expenditure*, this is one of the key concepts introduced by John Maynard Keynes that still today is at the heart of most macroeconomic theories about the determination of the overall level of employment (and thus the level of national income produced) in a country's economy during a given year…Thus Keynes invented most of the basic ideas of what is today the macroeconomists' conventional system of national income accounting when he formulated his famous aggregate demand identity:

$$\boldsymbol{Y = C + I + G + (X - M)}$$

Which simply means that a single country's aggregate demand for national product (*Y*) is always equal to the total demands of its households for Consumer goods and services (*C*), plus the total demands of its firms for Investment goods (*I*), plus the total demands of its various Government agencies for goods and services (*G*), plus the net demands of foreign consumers, firms and governments for the country's goods and services (exports minus imports)."

Comparative advantage

"The ability of one economic actor (an individual, a household, a firm, a country, etc.) To produce some particular good or service at a lower opportunity cost than other economic actors can. That is, the economic actor with a comparative advantage can produce the particular good or service by giving up less value in other goods or services that he could otherwise produce with his labor and resources than the other economic actors would have to give up in producing that same good or service. "

Fiscal policy

"That part of government policy which is concerned with raising revenue through taxation and with deciding on the amounts and purposes of government spending."

Monetary policy

"That part of the government's economic policy which tries to control the size of the total stock of money (and other highly liquid financial assets that are close substitutes for money) available in the national economy in order to achieve policy objectives…*Monetary policy is said to be "easy," "loose," or "expansionary" when the quantity of money in circulation is being rapidly increased and short-term interest rates are thus being pushed down. Monetary policy is said to be "tight" or "contractionary" when the quantity of money available is being reduced (or else allowed to grow only at a slower rate than in the recent past) and short-term interest rates are thus being pushed to higher levels*."

Relative Deprivation

Tedd R. Gurr developed this concept in his book titled: "Why Men Rebel." He uses a conceptual model to explain internal rebellion, particularly political violence in a form of insurgency. The theory is developed through two basic concepts: the perception of deprivation and the relative nature of the deprivation. Relative deprivation refers to a difference or gap between what people believe they have a right to receive (expectations) and what they actually receive (achievements). Gurr analyzes different scenarios that the divergences between expectations and achievements create (Gurr 1970).

Politicians rise and fall according to their successful management of economic matters. No clearer example of the dependency of a politician's fortune on economics exists than President Ronald Reagan's poignant question to Americans in the 1980 presidential debate: "Are you better off now than you were four years ago?" The answer to that question helped carry him into office despite the public's concern with other issues of the Republican political platform. Events elsewhere in the world have, likewise, shown how domestic economic failures have contributed, in either a negative or positive manner, to the fortunes of national leaders. Examples include the fall of Ferdinand Marcos in the Philippines in 1986, the success of the Solidarity movement achieving political power in Poland in 1989, the fall of Nicholae Ceaucescu of Romania and Erich Honecker of East Germany in 1989, and the elections to the presidency of Sam Nujoma of Namibia, Carlos Menem in Argentina, and Alberto Fujimori of Peru all in 1990. Most recently, the downfall of President Suharto of Indonesia and Prime Minister Hashimoto of Japan are excellent examples of mismanagement in economic matters. Currently, the stagnation of the economy is having significant effects upon the Russian political system.

II. Review of the Literature

Several books were used for the construction of this chapter. *International Political Economy: The Struggle for Power & Wealth*, by David Skidmore and Thomas Lairson, is a general textbook on International Political Economy intended for use either as a main text or as a supplement. The authors explain the basic concepts, theory, history and policy of international

economics. They include data and significant information on topics such as globalization, hunger, population and sustainable development, and methods for measuring development. Included also are economic liberalization country studies on China, India, and Brazil. Discussions on regional economic blocks, the Uruguay Round, and the World Trade Organization are also covered. Skidmore and Lairson also conduct an analysis of investment flows to developing countries and an examination of the 1994-95 Mexican peso crisis. Lastly, they conduct a comparison of post-communist systems in Russia, China, and Vietnam.

The Politics of International Economic Relations, by Joan Edelman Spero describes Western, North-South, and East-West economic systems. The two basic themes of Spero's book are the influence of politics on international economic relations and the political management of international economic relations in the years since World War II.

Economics by Martin Bronfenbrenner, Werner Sichel, and Wayland Gardner is an excellent, detailed textbook concerning well-established and controversial topics in economics. The authors go into discussion on such topics as microeconomics, macroeconomics, comparative economic systems, and international economics.

The definition of political economy includes both domestic and international dimensions. On the national level, public policies deal with issues such as road construction, housing, hospitals, and public education, federal budget, inflation, taxes, unemployment, and the environment. Politicians rise and fall according to their successful management of economic matters. How, then does political economy evolve nationally? And what policies do states put in place to deal with the complex issues of international trade and finance?

III. National political economy and its inter-relationship with other pol-mil factors

Domestically, political economy is the economic analysis of public policy issues and the making of policies for addressing these issues. Economics, the process of the authoritative allocation of society's values and its resources, pervades domestic politics since almost every political decision has an economic consequence.

A regime's political legitimacy, that is how well it is recognized by the public as the authorized bearer of national power and responsibility, is derived from various **religious**, **historical, cultural, ideological,** and economic sources. For example, the constitutional monarchy of King Hassan II of Morocco derives its legitimacy form the King's claim to the descent from the line of the Prophet Muhammad, his Alaouite dynasty's historical claim as the sole rulers of Morocco since 1649, and the monarchy's role in protecting Arab culture against Western influences and in negotiating independence from French colonialism. Perhaps of even greater significance is the King's ability to maintain strong military forces and his success at making the Moroccan economy one of the strongest in North Africa without the benefits of oil. Since a government's primary function is the maintenance of the national well being, its legitimacy depends heavily on its ability to provide economically for its citizens in terms of equity (income distribution), efficiency (economic regulation), and stability (economic growth and development). Thus, when a government loses the popular support of its population in these areas, it must either respond to retain its authority or eventually fall, whether it is a democratic or

authoritarian regime. The failure of the Communist Party in Czechoslovakia to sustain itself in national elections in 1990 is an example of the consequences of the loss of legitimacy. Similarly, the student demonstrations and massacre in China's Tiananmen Square in June 1989 profile an example of a government's harsh response to popular dissatisfaction and disillusionment. The level of popular dissatisfaction will determine a government's ability to loosen political and economic restraints for fear of losing its power to opposition groups. In the United States, the success of the Clinton administration to win election to a second term was due in part to the American public's impression of a strong robust economy.

> "Economic strength is the basis on which a nation satisfies the needs of its people for goods and services, and also on which it is able to build its organized military capabilities, manufacture arms, supply manpower, and provide the logistic and technical support needed by modern armies, navies and air forces. Through investment and trade, nations help to enrich one another, and standards of living depend not only on the efficiency of national economic activity but also on access to resources and markets through international commerce." (Pay S. Cline, World Power Trends and US Foreign Policy for the 1980's.)

Inherent in the preservation of the national well being is the capacity of a government to defend itself and to secure its interests abroad. The price to pay for security is high; **military** forces must be paid, equipment purchased, and wars fought. No government can devote its entire resources to security. Even in wartime, it must ensure food, clothing, and shelter to its population. Thus, the issue of guns versus butter surfaces as a political dilemma for most nations. Politicians must balance military expenditures with other expenditures for the national well being. The state must address issues such as how much of the nation's budget should be allocated to social security, agricultural support, education, development or improvements in infrastructure, and strategic and conventional weapon systems. In democracies, these perennial questions mold public debate; in authoritarian regimes the same issues shape policies -- but behind closed doors with little or no public redress for unpopular decisions. Until recently, the United States, Eastern and Western Europe were willing to devote large portions of their national budgets to defense. That situation has changed and defense cuts are appearing in the budgets of most of these countries. Some states such as Vietnam, China, North and South Korea, El Salvador, Israel, and Iraq, to name a few, still devote significant portions of their budgets to the military.

The guns-versus-butter dilemma affects military strategy in two ways: capabilities and strategy formulation. For instance, the American strategies of "deterrence" and "massive retaliation" evolved in American foreign policy in response to several different factors after World War II. First, the United States was reluctant to invest in a large military force to oppose Stalin's aggressive foreign policies. In this post World War II era, the American public was also heavily investing in the reconstruction of Europe and Japan, while the American economy continued struggling to throw off the vestiges of the depression, find jobs for returning troops, and convert wartime industries to peacetime industries. Nuclear weapons were cheaper than conventional military forces and carried a more significant and, therefore, effective threat of total destruction. The decision to pursue a nuclear deterrence strategy based on massive retaliation allowed for both "guns" and "butter" in the American economy.

On the other hand, the high cost of sufficient conventional forces to meet the Soviet threat compelled the United States in the 1950's to adopt a new strategy. "Massive retaliation" depended upon nuclear weapons to counter overwhelming Soviet conventional forces. While "Flexible response" has superseded it, costs still dictate ultimate reliance on nuclear weapons for conventional deterrence.

National interest determination frequently relates directly to the size and capability of a nation's budget. A country can only pursue those interests for which it has sufficient resources. In 1983, President Ronald Reagan decided that it was in the national interest of the United States to develop the Strategic Defense Initiative (SDI or "Star Wars."). In another example, Libya, in support of its stated national interests, has for years provided financial and other resources to various political extremist groups from the Irish Republican Army to the West German Red Army Faction to various dissident Palestinian groups based in Damascus. With the fall in the price of oil beginning in 1986, Libya has seen the bounties of high oil prices disappear. Colonel Qaddafi, Libya's leader, has been forced to cut back on his support of such international groups. Linked to Libya's national interests have been those of West European governments, especially France and Italy. Their decision to pursue diplomatic relations and ease economic restrictions imposed on Libya in 1986 after the bombing of a discotheque in West Berlin, reflect their economic interests in Libya.

Observations such as the aforementioned reinforce the intuitive recognition of the need for a solid understanding of a country's economic system to predict with any validity its actions and policies; therefore, the analyst must evaluate the political constraints and imperatives induced by economic conditions. This study commences with an assessment of the three economic functions of government: equity (income distribution), efficiency (economic regulation), and stability (economic growth). Sustained deficiencies in these areas mandate governmental actions to retain regime legitimacy.

In most Organization for Economic Cooperation and Development (OECD) countries, income distribution can be readily measured from published statistics. Median and model incomes and poverty-level figures provide a basis of measurement. In the absence of a significant middle-class, wide variance in income or wealth may lead to popular dissatisfaction that could foster governmental change or even revolt.

In non-OECD countries, the necessary statistics are often either unavailable or unreliable. For instance, in the former Soviet Union, President Gorbachev's salary was 900 rubles a month, much less than the 2,000 rubles a month a Soviet marshal earned. Yet, special discount stores--open only to the highest party officials--readily furnished expensive goods at lower prices, which the general public could not obtain at premium prices. In these situations, the analyst must rely upon nonstatistical measurements such as rationing, black market practices, and queues to describe the differences in living standards.

Government also assumes the responsibility of managing the supply of goods and services by regulation to assure the economy meets the needs of the populace. In a free or mixed market economy, a fundamental governmental task is to guarantee competition by controlling monopolies. In command economies where competition is minimal, this function includes

provisions for adequate production inputs. But efficient management of the economy also entails control of corollary production factors: spillover effects (pollution, unsafe drugs and foods, strip mining), public goods (public health services, highways, and law and order), and taxation. For instance, Zaire's (which is now the Democratic Republic of Congo) lack of adequate transportation systems impeded the flow of agricultural products and induced a return to subsistence agriculture after decolonization.

Finally, the government seeks to stabilize the economy to eliminate the peaks and troughs of the business cycle. Sustained economic growth results from an effective macroeconomic policy that consists of high output, high employment, price level stability, and sustainable balance of payments. While the Gross National Product (GNP) is the basic measurement of an economy, macroeconomic policy is gauged respectively by productivity, the unemployment rate, the inflation rate, and net exports. Lack of improvement in these four areas may pose the greatest threat to a government. Radical change or consistent failure in these areas indicates problems that governments cannot ignore without significant adverse consequences.

IV. International political economy and its inter-relationship with other pol-mil factors

Internationally, political economy is the interplay of economic and political factors in international relations and foreign policy. It may involve trade issues, monetary policy, or debt relief and economic restructuring. It has manifested itself through calls for a New International Economic Order (NIEO), a set of demands by the Third World to alter the existing international economic system to improve its economic conditions, and Dependency Theory, a neo-Marxist explanation for the continued impoverishment of the poor countries of the world. The Bretton-Woods International Monetary Order, the General Agreement on Tariffs and Trade (GATT), the International Monetary Fund (IMF), the World Bank, the World Trade Organization (WTO), and various Development Banks and international aid agencies are all responses to international economic problems within their political context. On a more regional basis, the effects of the direct relationship between politics and economics appeared in the European Union, the Magrebi Union of North Africa, the Gulf Cooperation Council, the Latin American Free Trade Association, the Central American Common Market, the Association of Southeast Asian Nations, the Asian Development Bank, and the North American Free Trade Agreement.

The examination of a state’s economy and international trade patterns can reveal vulnerabilities to **external influences**. Other states can use these weaknesses to achieve their own objectives. Economic sanctions offer a negative inducement. The Soviet grain and OPEC oil embargoes overtly illustrate this point, but often the tacit threat works more effectively. Although United States dependence on critical minerals from South Africa tempered American criticism of the Afrikaner regime, sanctions were imposed against South Africa.

The most difficult and perhaps the most rewarding political objective of international economics lies in the creation of economic ties of such a strong nature that countries mutually benefit from the relationships. Historical examples of this include: the European Coal and Steel Community; the context of the General Agreement on Trade and Tariffs (GATT); the Bretton Woods Accord; the Maghrebi Union of North Africa; the Asia Pacific Economic Caucus (APEC); and the North American Free Trade Agreement (NAFTA).

To determine economic dimensions of vital **national interests** and **international influence**, the analyst needs a framework to define existing relationships. Import-export balances, exchange rates, and current account deficits depict a country's general position in the international system. The peaks, troughs, and rapid changes of these economic indicators suggest external penetration and potential vulnerabilities, and indicate problems that could cause policy shifts.

As no event occurs in isolation from its predecessors, national economic systems do not operate in seclusion from the world around them. Most modern industrialized economies depend on imports to furnish raw materials and on exports to pay for them. No industrial economy can function without energy, yet few states have sufficient resources within their borders. Thus, the 1973 oil crisis offers a poignant example of the economic factor in the determination of vital national interests. The oil embargo prompted radical measures in Europe and the United States. Europe's continued dependence on foreign oil supplies led President Carter in 1979 to declare the Persian Gulf a vital national interest to dispel any delusions the Soviets might have had, following their invasion of Afghanistan, of continuing south to attain a warm water port. Similarly, Nasser's nationalization of the Suez Canal threatened British and French trade routes upon which their industrial development depended. His action intensified other grievances against him and precipitated the 1956 Anglo-French invasion of Egypt to recapture the Canal. The Gulf War was a result of a coalition of nations determined to repel Saddam Hussein’s invasion of Kuwait and the security of the rich oil deposits in the region.

A more accurate analysis surfaces through an examination of a country's self-sufficiency in four elements of economic power: energy, critical nonfuel minerals, industrial capacity, and food production. The need for energy permeates economies and, while oil constitutes the primary source, hydroelectric power, nuclear reactors, and old-fashioned coal enhance self-sufficiency and modernization. Scarce nonfuel minerals -- for example, iron ore, copper, bauxite, chromate, and uranium -- are critical to modern technology and, therefore, military hardware production. Three products most effectively indicate industrial capacity: steel (basic industry), aluminum (light industry), and concrete (building materials). These products, in turn, describe the country's capability to produce military equipment and necessary goods. People must eat, so food production also determines economic power. It can best be measured by net import-export of three basic foods: wheat, coarse grains, and rice.

The preceding factors depict gross vulnerabilities to external influence. They must be refined by examination of patterns of trade. If a country depends on a single country or region for any of the critical ingredients, a stranglehold could be established. If no alternative sources exist, then the source could be a vital interest. Similarly, trade routes by which products and raw materials are shipped become vital interests; e.g., the Panama Canal, and the Straits of Malacca and Gibraltar. In any case, any dependence on foreign sources for any of the economic factors of national power becomes a possibility for external influence by either denial or assistance.

While economics or any other single political-military analytical factor cannot tell the whole story, its pervasive impact on domestic politics, foreign policy, defense policy, and diplomacy dictates its prominent place in the analyst's repertoire of tools. Decisions always incur costs, and in today's intricate international system, they often have both an economic

impetus and an economic impact. As such, foreign policy can neither be understood nor predicted without consideration of the economic dimension.

V. Questions to consider

There are several basic questions the analyst must address when analyzing a nation's political economy:

1. In its bilateral or multilateral relations with other states, does the country use economic rewards or punishments; how effective are these techniques?

2. How dependent is the nation's economy on the outside world?

3. What kind of economy has the government established?

4. What are the social and political consequences of the decision to either shift or not to shift the economy?

5. Where does the nation's economy fall within the International Political Economy?

6. How do international law and regulations affect the nation's political economy?

7. Is the nation adopting protectionist practices? If so, why does it set barriers to foreign trade?

VI. Summary

Despite recent setbacks in Russia, Asia, and Brazil, the American economy appears vibrant thanks to its sound and effective economic policies. Faster economic growth supported by less government regulations and lower marginal tax rates on economic gains. A century ago, Karl Marx, the father of socialism, and John Maynard Keynes, the father of modern capitalistic economics, distinguished themselves by becoming two of the first economists to recognize the economic basis of political change. Although socialism and communism have since been discredited, their followers have not forgotten that relationship. Until recent times, capitalist scholars, politicians, and analysts have tended to separate economics from politics. Dramatic events of recent times have reminded them of the economic dimension to domestic and international political events. For the political-military analyst, the study of economics can not be divorced from the political context.

Chapter 10

Role of the Military

I. Introduction

This chapter introduces the military as an aspect of national power, a political actor, an economic force, and a key national institution. It outlines factors the analyst may use to explain and predict military behavior within a country. Focusing on the regional analysis mission of the PSYOP/Civil Affairs Officer, this chapter concentrates on societal roles and the relationship of the military to the political system. It leaves aspects such as tactics, order of battle and combat readiness to the military intelligence community.

II. Definitions

Military

For political-military analysis, the word "military" describes those armed forces identified by a government as its military. If a country considers its police forces to be part of the military, you should so treat them.

Types of Militaries

Because foreign militaries differ, the analyst operationalizes the definition by describing, contrasting and comparing their organization, makeup, roles, missions, and practices.

- Regular forces. Look at interservice and intraservice solidarity or rivalry; cliques or factions based on class, ethnicity, language, regional ties, or socioeconomic class and patronage ties.
- Defense establishment. This includes civilian leadership and bureaucrats.
- Militia/reserves/national guard.
- Paramilitary forces. A border patrol would be an example of a paramilitary force.
- Police or other security forces.
- Private armies/warlord armies. Private armies are those outside the regular military force structure; however, they are recognized as legitimate in the society. Warlord armies are those that are extralegal or illegal. Both armies generally hold personal loyalty to their leaders above loyalty to the government.
- Regular forces, paramilitary units, security forces, and private/warlord armies may contain mercenary units as well as indigenous soldiers.

"Non-Political" Roles of the Military

Militaries play a role in the society in which they exist and influence its development and function. Some of the roles that the military can play (other than defense) are --

Economic

Consumer

The military consumes significant resources, including funds, material, land, technology, and manpower. Defense costs a lot and may be a nation's single greatest expenditure. Military consumption creates jobs and can have a significant economic impact, at least on a regional basis.

Producer

Some militaries, such as in Burma, China, and Brazil, produce goods and services for the general public as well as for their own consumption. Most others at least assist in the areas of transportation, communications, disaster relief, and other public works projects. A lot of military production and technology is dual-use and provides benefits and spin-off products for the rest of society; e.g., cars, trucks, jeeps, electronics, and medical advancements.

Social Leveler

The military in many countries provides a path of social mobility for disadvantaged groups. In some countries, the upper classes disdain military service, so the middle and lower classes serve instead. The military also provides educational and training opportunities, ranging from basic literacy and other skills to advanced degree programs. This training often carries over into civilian life once the soldier has been discharged, providing a pool of both skilled labor and trained, experienced managers. Many countries go even farther and provide preferential treatment for former servicemen in civilian education and training programs. Whereas the military may provide an avenue of advancement for lower classes or minority groups, this can also lead to class conflict within the military or between the military and the ruling class. Similarly, in many countries participation in the military by certain groups is restricted.

Nation Building

When the military is the best-organized, strongest, most capable force in a country (and normally has a number of technical and problem-solving skills), it may be the entity best able to conduct sustained collective public activity. This may involve the exploration or settlement of border regions or other frontiers, such as during the 19th Century in the American West, in China, and in the United States and former Soviet space programs. It can include civic action projects such as building schools, hospitals, sanitation facilities, or resettlement villages. It can provide infrastructure such as bridges and roads, wells, canals, and irrigation systems. It can provide medical services, education and training for the general public as well as for soldiers.

The military can also provide citizenship training and some sense of national identity among the people, both through the training and indoctrination of recruits and through programs designed to inculcate the public with national values. Finally, the military can contribute to nation building by providing security and protection for the people and infrastructure from invasion or insurgency. This allows the government to establish legitimacy and the society to develop with stability.

Source of Force

The state is usually the sole legitimate source of force, and the military the primary medium to use it. The expertise of the military profession is the "management of violence," and this expertise can extend or restrict the control of a government.

Foreign Influence

The military can influence foreign countries positively and negatively. As a tool of foreign policy it provides influence along a spectrum ranging from exchange visits to foreign military training to advisors to shows of force and outright belligerent action. Territorial defense, its most universally accepted role, dissuades or repels invasions.

Political Roles of the Military

The non-political roles of the military have significant political implications. Moreover, since the military is a powerful, well-organized and well-disciplined institution, it is a political force just by existing. Although there may be clearly differentiated areas of responsibility between the civilian authorities and the military, the expertise and knowledge vested in the military also make it a significant political factor. The analyst determines how and to what degree. For example, what are the legal and historic parameters for military involvement in politics? What are the channels for military decision making, expression, and dissent?

In many developing countries, the armed forces have major political roles beyond what we in the United States consider appropriate for own forces.

Military involvement in politics varies from simple influence to direct military control of the political process.

Influence

The military is always one of several government agencies contending for power, position, and resources. Although there may be well-defined areas of responsibility between civilian and military authorities, the military may try to expand its own numbers, acquire larger revenues, and enhance or perpetuate its own position in the system. Either individual soldiers in key positions or the military as a whole can do this.

Active Participation

In some systems, the military plays a central rather than peripheral role in the political process. There are still clearly defined areas of responsibility among branches of the government, but the military may have certain veto authority and administrative duties. Soldiers may even occupy certain cabinet positions. The military may also put certain limits on the political process by delineating who it will or will not accept as a government leader.

Military Control with Partners

In this case the military is clearly in charge of the political system, but it has co-opted civilian technicians and bureaucrats. This type of government typifies "military regimes."

Praetorianism

In a praetorian state the military dominates politics. Perlmutter defines praetorianism as "A political process (as well as a type of government and type of civil-military relations) that favors the development of the military as the core group of the ruling class." A praetorian state is one in which "the military intervenes with and tends to dominate the executive."

Non-intervention

The military's refusal to act may render a government impotent, thus bringing it down. An example of this is the withdrawal of active military support for the Marcos regime in the Philippines in February 1986, leading to the accession of power by Corazon Aquino.)

Military Intervention in Politics

Definition

This section describes military interventions that are not part of the current accepted or legal system. These interventions forcibly substitute the military's policies and/or leaders for those of the civilian government.

Sub-coups

Displacement
The military intervenes directly by removing or otherwise neutralizing politicians, officials, bureaucrats, elites, or groups in an illegal, extralegal, or unconstitutional manner. They may also replace such parties with military members.

Pressure, Blackmail, and Threat
The military intervenes indirectly by forcing the government to act according to the military's agenda.

Intervention by Invitation or Default

The military may gain influence or political power under conditions not of its own making. Civilian authorities may ask the military to step in if the civilians feel incapable of governing, as in Burma in the late 1950's. The military may also be the only institution to survive domestic social and political turmoil, gaining political power by default. An example of this is the large number of government positions held by soldiers in China at the end of the Cultural Revolution in 1976 after several political leaders had been killed, imprisoned, or banished.

Characterization of an Intervention by the Military

Reason for the Intervention

Usually the military characterizes an overt intervention as necessary. Relying on a broad interpretation of national defense, the military moves to protect the country from the threat of weak, corrupt, and incompetent politicians, or to resolve a crisis. Even if the reasons for intervention are less noble (e.g., class, regional, ethnic, corporate, or individual self-interest), the military will cloak or justify its actions in the rhetoric of patriotism, national interests and security.

Planned Duration of the Intervention

The military usually asserts that an intervention is temporary, and promises to restore normal government when the conditions prompting the interventions are gone. However, sometimes the military is reluctant to relinquish power and return to the barracks.

Military Coups (*coups d'etat*)

Definition

A military coup is a forcible takeover of the legal government by the military.

Actors

With exceptions, field grade officers of the national army usually plan and lead intervention or *coups d'etat*. Since senior officers are normally part of the ruling elite and have a stake in the status quo, coup leaders may see them as part of the situation-giving rise to the coup. A senior officer or a junta of senior officers may end up in power, but field grade officers normally instigate interventions. Company grade officers, NCOs, or the rank and file usually do not have the expertise or the span of control necessary to plan and implement a coup. Similarly, police and militia forces normally do not have the national command structure, organization, and orientation necessary to intervene.

Results

Once the military has taken power, it has four basic options. It can either return or retain power, or it can expand or restrict political participation. If the military intervenes because of specific policy grievances, it may restore civilian rule once those grievances have been corrected. Intervention prompted by a breakdown or distrust of the political system as a whole, however, usually leads to the establishment of a praetorian state. Once the military takes power, only rarely does it succeed in building more effective democratic political institutions.

Instead, military rulers are often "civilianized" and political parties and electoral systems bent to meet the desires and needs of the military regime.

Despite the military's assertions that the intervention is temporary, military rule is generally of long duration. More important, once the military has intervened, it is likely to intervene again, assuming it gives back power in the first place.

Similarly, if the military does intervene, it is usually unable to govern a complex society on its own and must, therefore, co-opt the civilian structure, if for no other reason than to establish its own legitimacy. Since it is hard to govern indefinitely by brute force, and since militaries are not usually adept at handling the subtleties and complexities of running all aspects of a country, cooperation with certain civilians is essential. Those civilians are usually willing to cooperate once they realize that their own prerogatives are not threatened by the military regime. This leads to "military control with partners."

Indicators for Intervention

The only states that seem relatively safe from military intervention are well-established Communist totalitarian states and well-established liberal democracies. Even these states are not immune, as the French experience in Algeria in the early 1960's attests. The following indicators apply to most military interventions.

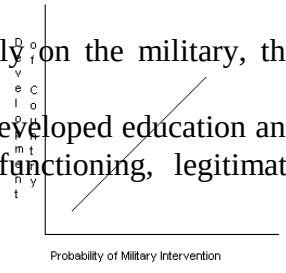
Indicators in the Military

- Heritage of Intervention. Regardless of their legal mission and role, militaries do not ignore their historical role. By far the most consistent predictor of a military coup is a previous coup. Moreover, the more coups have occurred, the more likely is a subsequent coup.
- Delineation of Responsibilities. The more clearly defined are the areas of responsibility between the military and the civilian authorities, the less likely is intervention. This clear delineation also facilitates civilian control of the military.
- Civilian supremacy as a totally accepted rule. This grossly inhibits intervention. See *Civilian Control of the Military*, below.
- Readiness. The fear that politicization will destroy the military's ability to fight reduces the probability that they will intervene.
- Fear of Failure. The military may fear that losing the intervention will bring about the end of the military. This deters intervention.
- External and Internal Mission. Risk of intervention is also reduced the more the military is oriented on defense against an external threat. Conversely, the use of the military to quell civil unrest increases the possibility of intervention. If the government uses the military against political opponents, especially against the advice of the officer corps, intervention is even more likely. Furthermore, the more involved the military is in internal issues, the more political it becomes. Finally, militaries which are active in civic action operations are less likely to intervene. It is therefore important to distinguish clearly between the international and domestic duties of the military, police and/or militia.

- Guardians of the Nation. The explicit or implicit mission of soldiers to be the saviors or guardians of nation or the constitution stimulates intervention when either is in danger. (Note that the constitution may prohibit intervention.) Note that this distinguishes between a mission to serve and protect the nation from a mission to serve and protect the government. Furthermore, when the military identifies itself as embodying national interest, it feels entitled to intervene.
- Ulterior Motives. The military may use the nobler motives of national interest and patriotism to disguise protection of a sector (the rich), a class (elites), the military itself, or for motives of pure careerism.
- Divisions in the military. Certain factions in the military may be at odds with other factions. In many coups, these factions separate themselves and pursue their agenda through intervention. On the other hand, such disagreement or factionalism may inhibit the military's ability to intervene.
- Geography. Military units scattered throughout the country or deployed overseas are less able to intervene than if they are concentrated in the national capital.
- Specialization and division of labor. The more technical the military is, the more complex and well-defined missions and responsibilities are within it, and the less chance there is of intervention. Ground forces are more likely to intervene than naval and air forces because the army is usually the largest but the least complex of the uniformed services in a country. In many cases it is deployed in large numbers in the vicinity of the capital, often as a "palace guard."
- Political awareness of the officer corps. Generally, the more politically sophisticated the military in general, and the officer corps in particular, the more likely is an intervention.
- Consciousness of kind. Militaries with extreme senses of being distinct, special, and elite, are more emotionally capable of intervening.
- Sense of power. To the extent that militaries see themselves as overwhelmingly powerful, they may be disposed to intervene.
- Grievances. A military that believes itself already the victim (or under the threat) of some societal or government wrong is more willing to seek redress against the offending system.
- Defeat in war. A defeated military, especially if it feels the government had somehow let it down, is more likely to intervene.
- Officer recruitment patterns. Officers of the same social strata of the governing elite are less likely to initiate or participate in interventions.

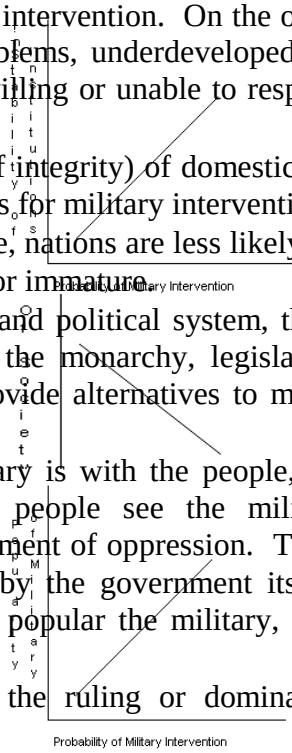
Indicators in the Situation

- Domestic Circumstances. In all cases there is a plausible national "reason" for a military intervention. Overt crisis, latent crisis, or a power vacuum all provoke the military to intervention. If they are not the real cause, they may be the putative cause.
- History. Countries with one coup have a far higher probability of a coup than countries with no coups in their history. Countries with more coups are more susceptible. The more recent the coup, the more probable the next.
- Civilian dependence on the military. Where society relies heavily on the military, the military has more opportunity for successful intervention.
- Development of the Country. As a rule, a high literacy rate, well-developed education and communication systems, urbanization and a well established, functioning, legitimate



political system in the country, all tend to inhibit military intervention. On the other hand, agrarian societies with serious economic and social problems, underdeveloped education and communication networks, and a political system unwilling or unable to respond to the needs of the nation face a higher risk of intervention.

- Stability of the Country. Perceived disintegration (loss of integrity) of domestic, political, economic, and social institutions is one of the main reasons for military intervention.
- Political Culture. Where political culture is high or mature, nations are less likely to accept intervention than in nations where political culture is low or immature.
- Complexity of Society. The more complex the society and political system, the less the chance of intervention. Other foci of power, such as the monarchy, legislature, labor unions, the bureaucracy, and opposition factions can provide alternatives to military rule and, therefore, inhibit intervention.
- Popularity of the Military. The more popular the military is with the people, the more likely the chance for intervention, especially if the people see the military as a counterbalance to the government rather than as its instrument of oppression. The military may even be asked by the people, and in some cases by the government itself if it is threatened with popular revolt, to take over. The more popular the military, the greater their perception of their actions being accepted.
- Ethnic and Class Cleavage. If these conflicts attack the ruling or dominant group, likelihood of military intervention rises.



Civilian Control of the Military

Importance

Civilian control of the military is a characteristic that typifies nations free from military intervention. Whether it exerts a causal, inhibiting effect is academic. However, many of the factors, characteristics and circumstances that accompany or facilitate civilian control of the military relate closely to factors that do inhibit intervention.

Constitutional Constraints

Nations constrain the military by placing a civilian commander in charge of the armed forces or by explicitly subordinating the military to a civilian governmental organ. They can vest power in the civilian legislature to raise and maintain armies and navies, to conduct investigations, to declare wars or states of emergency, and to pass or approve budgets. Almost all countries have constitutions or laws that specify civilian control, but constitutional restraint requires the willing acquiescence of the military.

Ascription

This is where the military identifies closely with the political system and the ruling class. This can be done by integrating the military with social forces or by keeping it separate from them. The integration occurs in three ways:

- Class congruity. The military, especially the officer corps, can come from the same social class as the ruling elite. This has been true especially of West European armies. Even in

colonial armies, the officer corps has had ties to the homeland and generally did not even intermarry with the natives.

- Nation-in-arms. The country requires universal military training and service. This guarantees security by total participation of the polity. There is a small professional military core. The army comprises citizens who become soldiers in time of crisis; however, these soldiers do not permanently set aside their civilian roles. Government civic education is tied to military training and defense. The civilian militia may act as a counter to the threat of a coup by the professional army. Civilian-educated officers often serve a similar purpose. This system is used in Switzerland, Israel, and to a degree in postwar United States.
- Party control. Placing the military under control of the "party" integrates it with social forces. Communist countries use this means.

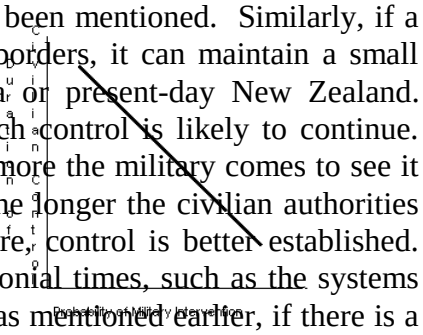
Separating the military from society. Drawing the military from certain areas or groups and stationing them in places other than their home regions or in remote borders and frontiers accomplishes this. This was common among colonial armies, who not only set large numbers of soldiers' abroad but also recruited locals from what they called the "martial races," such as the Gurkhas or the Sikhs. Many countries, including the former Soviet Union, China, and 19th Century America, have practiced stationing troops along borderlands or in frontier regions.

Army of the Ruling Party

Many Communist countries use this means to enhance civilian control. Communist revolutionary armies politicize the masses as part of their overall strategy. Revolutionary guerrilla warfare is as much political as it is military. Once in power, the party continues to use its parallel apparatus of the commissariat to control the military. Many countries also give preferential treatment to soldiers applying for party membership, causing soldiers to identify with the goals and well being of the party and, therefore, the state. In a Communist political system, party hegemony is linked to military power. The military is the linchpin of the party-state relationship.

Geography and History

The benefits of stationing forces in remote areas have already been mentioned. Similarly, if a country is relatively isolated or has no serious threat on its borders, it can maintain a small army, which is easier to control, such as in early America or present-day New Zealand. Additionally, if a nation has a history of civilian control, such control is likely to continue. Civilian control is self-perpetuating. The longer it exists, the more the military comes to see it as proper, and military intervention as unnatural. Similarly, the longer the civilian authorities govern, the more experience and expertise they gain; therefore, control is better established. This can even be true of armies who trace their history to colonial times, such as the systems extant in India, Malaysia, and Singapore. By the same token, as mentioned earlier, if there is a history of intervention, then intervention is likely to recur.



Clearly Defined Spheres of Responsibility

This factor is perhaps the most important.

- Military. The wider the sphere considered appropriate for military involvement, the greater the chances for intervention in politics. The more well defined and restricted the military sphere of responsibility, the less the probability of intervention. However, a corollary to this is that the military should have relative autonomy within its own areas.
- Civilian. Civilian interference in military affairs is just as unpalatable, and in some cases just as risky as military interference in civilian affairs. The best protection against military intervention may be legitimate, widely supported, effective political institutions on one hand, and a voluntary restraint on behalf of the military and civilian authorities alike not to use the military for domestic security on the other.

III. Analytical Questions

The answers to the following questions relate directly to the principles stated above.

- What is/are/constitute the military forces of this country? Who says?
- What is/are their organization(s)? Makeup? Roles? Missions? Practices?
- Are there inter/intra-service rivalries? Cliques? Factions? Why? How? Who?
- What is the nature of the defense establishment?
- How significant is the military economically? In what ways? Producer? Consumer?
- Are military responsibilities delineated clearly? Does practice follow the delineation?
- Does the military serve and protect the nation or the government?
- What internal (domestic) roles does the military have? What have they done?
- What external roles does the military have? What have they done?
- What is their capability to defend? Attack? State of training? Equipment? Maintenance?
- Who are the soldiers? Officers? Where do they come from? How are they educated?
- What is their economic and social status? Are there restrictions? Preferences?
- How is the military organized politically? By unit? By year group? By branch?
- Are any military leaders part of the elite? Do they go on to become elites?
- What are the legal limitations on the military? Are they clearly defined? Clearly obeyed?
- Is it subordinate to civilian authority? How? How much? How long?
- Is the military apolitical or political? In what ways? How much? Which part?
- Is it cohesive? Are there opposed factions?
- Is it geographically dispersed? Are there units near the capital? The border?
- Does anything threaten the military? Budget? Limitation of influence?
- Is this a military regime? Military control with partners? A praetorian society?
- Have there been coups? How? When? Why? Who did it? The surrounding circumstances? How many? How recently?
- Does the public think the coup(s) was (were) a good thing?
- How long did the military stay in power? How did they relinquish power?
- How does the military handle its weaknesses at governing?
- Is the country well developed? Is literacy high? Are the people informed? Are there social and economic problems?
- Is there a crisis? Is the government solving the problems?
- How long has the government been democratic (if at all)?

- Is there popular support for the military?

IV. Inter-relationships with other Pol-Mil Factors

- History: The primary predictor of military intervention in a country is prior interventions and their nearness in time. Likewise, all military behavior is as predictable (or unpredictable) as any other human endeavor, using history as the basis.
- Natural Environment: In many countries, nation building requires the military to tame the environment. Conversely, the environmental truths of countries often define the role and makeup of the military. Coastline determines the size of the navy. The number of boundary nations determines ground forces. The extent of the hinterlands affects the capabilities and the use of the air force. The military's success or failure in natural disasters may affect its prestige, legitimacy, acceptance, and overall influence.
- Cultural Environment: Culture determines the makeup and acceptance of the military, as well as its roles.
- Political Systems: Political systems determine the legal basis for the military and the politicization of its members. The robustness of political systems determines the probability of military intervention.
- Political Economy: Militaries consume and produce. They enforce customs rules, protect national waters and lands for enterprise.
- Ideology: Militaries constitute guarantors of ideology as it becomes policy. Military culture often reflects national ideology, especially as it relates to patriotism.
- Religion: In some cultures, militaries are comprised of soldiers of one religion. In some cultures, religions prohibit or discourage military service.
- Foreign Influence: The military might constitute a national resource to exert influence on other countries, or resist influence from other countries. Some militaries are linked to other states through shared military histories or current operations and cooperation.
- Leadership: Many nations recruit leaders from the military, and in praetorian societies and military regimes, the military are the national leaders.
- Regional Perspectives: The strength of a nation's military, especially compared to the militaries of other nations, affects its outlook in international affairs -- how it forms alliances, and how it pursues solutions to problems.
- National Interests: As reliable, competent and obedient bureaucracies, nations view their militaries as mechanisms to pursue their interests.
- Ethnicity: Many militaries draw enlisted and officers from certain ethnic segments of society.
- Elites: As in leadership, the military may contribute its leaders to the elites, or may form the main elite structure for the nation.

V. Conclusion

The military plays an important role in virtually every nation, serving as both cause and effect. Determining the nature of that role, and its relationship to other analytical factors, may enable you to better explain and predict important events, recommend appropriate policy, and generate sound courses of action.

New Haven and London: Yale University Press, 1980. {This is a great collection of writings on military in politics. It contains several articles about professionalism in the military. The conflicting views on professionalism justify its omission here as a separate factor. Also, the book has articles on praetorian regimes by region, and the history of praetorian societies.}

Welch, Claude E. Jr., ed. Civilian Control or the Military: Theory and Cases from Developing Countries. Albany, NY: State University of New York Press, 1976. {Welch places nine case studies between two of his own articles on the subject. His first article describes the attractiveness of civilian control, and provides a model to analyze the extent of civilian or military control of government. His last article prescribes methods to attain or enhance civilian control of the military. The case studies cover India, Malaysia, the Philippines, China, Japan, Finland, Mexico, Lebanon, and Chile.}

With Arthur K. Smith. Military Role and Rule: Perspectives on Civil-Military Relations. North Scituate, MA: Duxbury Press, 1974. {This work constitutes a solid primer on analysis through case studies of military intervention and military rule. The first section of the book posits principles of intervention. The second section provides case studies from Thailand, Nigeria, Peru, Egypt, and France. The last section analyzes these case studies to validate the principles proposed in the first section.}

Chapter 11

Leadership

I. Introduction

Even though we personify countries when we say things like "Russia announced today that . . ." or "Egypt today took action to . . .," usually some leader caused or influenced the action. Accordingly, explaining and predicting the leader's actions help to explain and predict the country's actions.

II. Definitions

Leadership occurs when, in a context of competition and conflict, people with motives, purposes and resources mobilize other people in order to realize goals independently or mutually held by both leaders and followers. (Burns, passim.) Leadership may be legal, illegal, or extralegal.

Leaders exercise power and authority.

Power is the ability to mobilize or immobilize people to produce intended results for particular purposes. The exercise of power may be legal, illegal, or extralegal. It relates to the purpose or goal of the power-wielder only. National leaders obviously have power (as do robbers, rapists, priests, parents, oligarchs and Army officers). Brute force is one form of power, but not the only one.

Authority is the legitimate exercise of power. When people recognize the right of a person or group to wield power over them, even to the point of using force, then that person or group has authority. Authority may be acquired through special training, conferred by virtue or one's position, or both. Army officers, teachers, and policemen all have authority, even though many of them may not be leaders per se. Again, concern for effects is largely one-way.

Relationship of Leadership, Power, and Authority. Leadership transcends power and authority because it incorporates the goals and aspirations of the subordinate as well as the leader.

The expected response from the led conditions the behavior of the leader. The leader may be able to mobilize others for his own purpose, but more often he is "merely adept at identifying himself with the conditioned will of the crowd and identifying for the crowd its own purposes." (Galbraith, pp. 44-45.)

The leader articulates, defines, or creates goals and objectives for the followers. He may do this by making their goals his, his goals theirs, or both. He may arouse latent attitudes and desires or give rise to new ones. He can establish an identity for the crowd, showing its members what they have in common; e.g., Mao and the Chinese peasant. In

so doing, the leader can change an amorphous mass of people into a powerful political force.

Effective leadership tends to appeal to higher, more general and comprehensive values that will embody the more fundamental, mundane needs of the follower.

Types of Leadership

James MacGregor Burns distinguishes between two types of leadership.

Transactional leadership. The leaders and followers exchange something for something; e.g., jobs or lower taxes for political support, cooperation and obedience for promotion. The exchange may be on a political, economic, or psychological level. This is the kind of leadership the vast majority of leaders exercise. It is also the kind of leadership most of us exercise as Army officers.

Transformational leadership. The transformational leader looks for potential motives and attempts to engage the full power of the follower, satisfying the follower's higher needs, and raising him to a higher level of motivation and morality.

This leader acts as a moral agent. He may be "inspirational." Again, this leadership is symbiotic, and considers the needs of the follower.

While transformational leadership is rare, it is what most military officers like to believe they are exercising. (Burns only uses "transformational leader" for those who take their followers to a higher moral plane. Other scholars feel that this is too restrictive. To them, all the leader has to do to be "transformational" is to transform his followers, for good or ill.)

Although a transformational leader must also engage in transactional leadership, someone who is adept at one may not be at the other. A good transactional leader may be better able to hold his position through good management practices than a transformational leader who rises by sheer force of personality--only to get mud on his toga once in office.

Culture and Leadership

Social and cultural contexts help explain leadership. Culture plays a role in shaping the needs, values, and personalities of leaders and followers alike. What, in each culture, confers the mantle of leadership?

To accomplish his goals, the leader must direct the behavior of others. How he does this will vary greatly among societies. Cultural norms create expectations and judgments regarding the appropriate behavior of leaders and followers. These norms may be mystical or religious, practical or technical.

Since these norms differ, Pye points out that political leaders don't travel well across cultural lines. There is no such thing as the leader for all people in all societies at all times.

(Leaders in one culture can be effective or have significant influence in another society. However, he probably will not achieve leadership status outside his own culture; e.g., Gandhi. Leaders may also come to power in spite of cultural obstacles; e.g., Indira Gandhi of India, Bhutto of Pakistan, and Sirimavo Bandaranaike of Sri Lanka.)

The culture helps determine the centers and sources of leadership in the society. These may include interest groups, government bureaucracy, military, media, political parties, trade unions, universities, or religious organizations. Some will support the current ruling authorities and some will be in opposition. Some will be legal or nongovernmental, others will be illegal or extralegal.

Within and among these centers an analyst can discern the mode of distribution, or the formal numerical distribution of leadership roles; the mode of mobilization, or the means available to leaders for carrying out their roles; and the means of allocation, or the types of leadership opportunities that exist, the purposes and methods of training new leaders, and how individuals and groups gain access to leadership positions. (Rosen in Kellerman, pp. 39-42.)

How a leader becomes a leader.

There are at least six ways that people can assume positions of leadership. They may also occur in combinations.

- Inheritance. This is common historically, especially in societies where the upper classes were specially trained for leadership as part of *noblesse oblige*. Where this phenomenon is found today, ascription and achievement usually go hand-in-hand. Someone may gain initial access to leadership positions by right of birth, but must undergo special training and prove themselves worthy of leadership. Leaders in societies as diverse as Britain, Japan, and North Korea still assume leadership positions through inheritance.

- Force or threat of force (military coup or rebellion).

- Ideological appeal (Gandhi).

- Foreign support and assistance.

Starting one's own organization. This normally occurs when the needs of the leader and those who follow him are not being met through existing organizations. People who achieve significant positions of leadership in a society via this mechanism usually do so in times of crisis.

- Institutional selection. This is the most common today. Positions and duties of leadership are formalized by one's predecessors and by regulations and codes. The leader comes up through the institution, holding lower offices in successively more responsible positions. At the upper echelons, leadership within the institution can translate into national leadership. This does not necessarily mean that the process is democratic. Communist parties and the military are two examples of organizations that have undemocratic institutional leadership selection processes.

Aspects of Leadership

Leadership can be better understood if looked at as a system where the leader, in conjunction with the follower, mobilizes resources and means to accomplish goals for particular purpose within an environment of conflict. The following model reveals several aspects of leadership.

o Leadership is purposeful. Naturally, the purpose must meet the needs of the leader and followers alike once it is achieved.

o Leadership is goal oriented. Leaders point a direction and tell how objectives are to be accomplished.

o Leadership is causative. Leaders affect social relations and political institutions, if only to maintain them. The leader tries to bring about change. Good leaders bring about intended rather than unintended change.

o Leadership is dissenting.

Leaders overcome obstacles in the environment to accomplish goals. Without obstacles, his followers could accomplish their goals on their own. Obstacles include opposition groups, laws, scarce resources, and cultural constraints.

Conflict also exists between leader and follower. Followers have goals and agendas which may not fit snugly with those of the leader. Few will agree with their leaders on all issues. Leaders must reconcile divergent groups and resolve conflicts among their various constituencies. This is especially true in political parties.

Conflicts may also arise between party bureaucrats who want to serve party interests, and government officials who are party members but who feel a responsibility to serve the needs of a larger constituency.

o Leadership is social.

In the symbiotic relationship between the follower and the leader, the leader fulfills some need for the follower, who then consents to follow. Two or more followers constitute a group. Individuals join groups to add their voice to others with similar ambitions, gaining access to a wider audience. Through the group the individual

converts personal effort into social action. Leaders, then, must not only meet individual needs but also group needs.

Leadership does not have to be governmental, but it is institutional; e.g., Lech Walesa or Desmond Tutu. However, it is not enough for a leader to meet the needs and wants of large numbers of followers. The leader must also be aware that in doing so he reorganizes the needs and goals of the followers, creating new wants and needs in the process. He must then be prepared to help formulate those new demands as well and to meet them. This is done through an organization.

Organization in Leadership

Organization is the most important source of power for leaders in modern society. Usually, that person whom we call a "strong" leader not only has a dominant personality and other personal "leader" traits, but also a strong group or coalition of groups behind him. Similarly, a "weak leader" is generally one whose supporters are few or poorly united. Obviously, personality may be closely related. A leader with a strong personality will draw large numbers of people to him, which may allow him to garner more influence if he can incorporate them into his organization.

Subordinate leaders are a significant part of an organization. Each leader deals with subordinate leaders who have needs, goals, and resources of their own. Second and third echelon leaders are a significant part of the leadership system. A change in subordinate leadership may signal a change in policy. It may also be a source of unintended change because of the way the new subordinate implements policy. Moreover, the type of subordinates he has can provide some insight into the type of person the leader is. First-rate leaders surround themselves with first rate subordinates, while second-rate leaders surround themselves with third-rate subordinates.

The ostensible leader may not really be in charge of an organization. Government decisions are usually collective. One particular leader may get the credit or the blame, such as in the "Bush administration," the "Thatcher government," or the "Mubarak regime," but politics is by and large a team sport. This collective nature of governmental leadership can make it difficult to distinguish just who the most important leaders really are.

"Headship" is not necessarily leadership. There are several heads of state who are merely figureheads, while the head of government actually runs the country. Similarly, economic and social status do not necessarily equate to political leadership; e.g., Malaysian Chinese or Buddhist monks in Southeast Asia. The real leader may not be the person nominally in charge, but the one who gets things done; e.g., Deng Xiao-ping in China. Determine where the real power lies. Only some ministries and committees in government or other positions in society are most important (for example, the Senate Armed Services Committee or the House Ways and Means Committee in the U.S. Congress, the Military Affairs Commission in China, or the Catholic Church in the Philippines). The same is true for opposition groups. In most environments, the

opposition has power and can exercise leadership. Even leaders who may currently be out of favor can exert influence or play roles in the future. Deng Xiao-ping was purged twice before he last came to power in China. Ayatollah Khomeini was in exile for years before he came to power in Iran.

Personal Characteristics of the Leader

o Maintaining power. No matter how effective he may be, no leader is omnipotent. Accordingly, his first order of business is to maintain and/or enhance his position. Because of the friction between leaders and followers, there will always be a system of checks and balances, both formal and informal. As a result, the leader will believe that he has insufficient power to accomplish his objectives and so needs to acquire more. If the checks and balances are weak, the leader can abuse the power he obtains. This is what occurs in authoritarian leadership systems.

o Feet of Clay. As a human being, the leader responds to human personal and psychological pressures. Some of these influences weigh more heavily on the leader. They might be sex (Gandhi), family (MacArthur), class, religion, age, money, health, or the spouse. The leader may be people oriented or structure/process oriented. He has an ideology, a world view, a background and a personal history. He has personal goals. He may be consistent or erratic. Someone may influence him, like Suharto's soothsayer. This type of information resides in biographical dossiers maintained at embassies and various intelligence organizations, biographies and autobiographies, and certain journals or newsletters like Defense and Foreign Affairs Weekly or Current Leaders. Retroactive psychoanalysis of past leaders may reveal a lot about leadership in the culture in which the subject lived.

III. Analytical Questions The answers to the following questions relate directly to the principles stated above.

o Who is the true leader of this organization?
o Does this organization exercise real power or influence? How?
o What factions support the organization?
o Who are its members?
o Is it strong? Well supported? Widely supported? By whom?
o What motivates this leader (money, sex, recognition, power, ideology)?
o How did the leader come to power? Is he charismatic?
o How do leaders come to power in this organization? In this culture? Does he have those traits?
o Did he come to power via normal channels or did he circumvent them?
o What are this leader's strengths? Weaknesses? Desires?
o What strong lessons has he learned through success? Failure? Difficulty?
o In which environment does he thrive?
o Is he an "organization man" or a maverick?
o Does he fit the traditional mold, e.g., right family, right school, or is he an upstart?
o To whom is he beholden? What are their goals?

- o Who are his confidants?
- o Is his focus on international affairs, domestic politics, economic and social issues, or defense?
- o Are his management approach and leadership style autocratic, democratic, or laissez faire?
- o Does he share power or hoard it? With whom does he share?
- o Does he make decisions with input from others?
- o Do others actually participate in the decision-making process, or does the leader make the decision and then seek or demand support for it?
- o What type of people does he surround himself with?
- o Is he reluctant or too quick to make decisions?
- o What threatens his position? His organization? His goals? His organization's goals?
- o Who are his subordinates? Which can be leaders?
- o Is there succession? How does it work?
- o What friction is there between the leader and the led?
- o Has the organization changed personnel recently? Why? Who caused it?

IV. Inter-relationships with other Pol-Mil Factors

o History: Patterns of the characteristics of past leaders repeat themselves within a region and a country. Charismatic leaders harken back to other successful leaders, and play on their similarities and differences.

o Cultural Environment: Culture determines the accepted characteristics and sources of leaders.

o Political Systems: Political systems determine the legal basis for governmental organizations, and establish the conditions for nongovernmental and opposing organizations.

o Political Economy: Economic problems create the openings for leaders. Economic successes help them maintain power.

o Ideology: Leaders identify themselves with ideologies, and may derive their power and followership with this identity.

o Religion: In some cultures, the true leaders are religious leaders. In some cultures, religious leaders exert greater influence than the political structure suggests. In other cultures, leaders must recognize and comply with religious strictures to maintain legitimacy.

o Foreign Influence: More than elites, leaders serve as the principle agents between governments, and are often the conduits or definers of international agreements and negotiations.

o Regional Perspectives: A source of legitimacy for leaders is the quality of their adherence to regional perspectives, and how their agendas and policies reflect commonly held views.

o National Interests: Political leaders articulate and openly pursue national interests.

o Ethnicity: Ethnic groups may choose leaders to represent them. Leaders may be chosen or not on the basis of their own ethnicity.

o Elites: Although a person can be an elite and a leader, elites differ from leaders in that they always represent the top of some class, while leaders need not. Furthermore, leaders must have followers, while elites need not. Finally, both leaders and elites exert real power and influence.

V. Conclusion

Because they exert real power and influence, leaders are often the immediate cause of important circumstances. Accordingly, political-military analysts must understand the leaders in a region. Explaining and predicting leader behavior will help to explain and predict national behavior.

Chapter 12

Elites

1. Introduction

Analysts study elites because they occupy the most influential positions or roles in the governing institutions of a community, or exert influence on those institutions. They are incumbents, leaders, rules and decision-makers. Watching them provides insight into the core values of a community because those core values determine what constitutes the best, what characteristics or activities are influential, and what constitutes real power. Watching them also helps establish cause and effect relationships, since power and influence define elites.

11. Definitions

- **Elites**. For the purpose of political-military analysis, elites are defined as people who:
    - **Are the best of their class.** This class can be any categorization of people, activity, or sphere of social life. Those at the top are the elite. Within their category, other members look up to them, defer to them, and often follow them. The members of the class determine who is best and how "best" is measured.
    - **Exercise power and influence.** The elites that we study are only those who exercise real power or influence. This part of the definition simply relieves you from studying excellent people who do no significantly affect the situation. Some elites have more weights than others because they exert more influence.
- **Strategic Elites.** The ruling elite, top influentials, or the power elite are other terms to describe those elites who exert their influence on society as a whole, rather than on a segment. These leading individuals or groups maintain and develop the society and its culture (patterns of beliefs and values, shared means of communication, and major social institutions) are the strategic elites. No single stratum exercises all key social functions. Accordingly, the functions and the associated elites are specialized.
- **Segmental Elites.** Elites who exert their influence on a major subdomain of society.

Types of Elites

- **Ruling Caste.** One stratum does the most important social tasks, obtains its personnel through biological reproduction, and is set apart by religion, kinship, language, residence, economic standing, occupational activities, and prestige. Religious ritual is the main force that supports the position of this ruling stratum.
- **Aristocracy.** A single stratum monopolizes the exercise of the key social functions. The stratum consists of families bound by blood, wealth, and a special style of life and supported by income from landed property.
- **Ruling class.** A single social stratum is associated with various key social functions, and recruits its members into its various segments based on wealth and property rather than of blood or religion. Historically, ruling classes have held economic rather than political power, but their influence tends to extend to all important segments and activities of society. Although various differentiated and specialized sectors may be distinguished, they are bound together by a common culture and by interaction across segmental boundaries.

Functions of Strategic Elites.

Elites focus attention, coordinate activities, and keep things working. They help a country manage problems, change, growth and crisis. Elites symbolize and perpetuate the unity of a culture by emphasizing common purposes and interests. They coordinate and harmonize diversity. They minimize factions and resolve group conflicts. They try to protect their group from external danger. These functions can be grouped as:

- Goal attaimnent, the setting and realization of collective goals. These are the current political elite;
- Adaptation, the use and development of effective means of achieving these goals. These are economic, military, diplomatic, and scientific elites;
- Integration, the maintenance of appropriate moral consensus and social cohesion within the system. These elites exercise moral authority, such as priests, philosophers, educators, and first families;
- Pattern maintenance and tension management, the morals of the system's units individuals, groups and organizations. The elites that keep the society knit together emotionally and psychologically, are such celebrities as outstanding artists, writers, theater and film stars, and top figures in sports and recreation.

Quantity and variety of elites.

- In less complex societies elites are few in number and comprehensive in their powers. In societies at very simple levels of development, one elite may perform all four-system functions.
- More advanced industrial societies will tend toward several elites whose functional specialization accompanies a growing moral and organizational autonomy among them. As populations grow, occupations become differentiated, moralities vary, bureaucracies increase, and societal leadership moves from aristocracy or ruling class to leadership based on strategic elites. A large, industrialized country, with many occupational, regional, and ethnic differences, a society with levels of power, work, prestige, wealth, and lifestyle will probably not vest leadership in a single hereditary or traditional group, or in a single ruler. Instead, these elites will probably be specialized and varied.

Elite Goals

Elites seek to:

- Preserve the ideals and practices of their societies and sub-domains.
- Maintain their status as elites. This is the most predictive characteristic of an elite.

Recruitment

Elite replacement, or recruitment, is the process of attracting and selecting suitable candidates. Recruitment occurs in two basic ways: on the basis of biological (or social) inheritance and on the basis of personal talents and achievements. One of these tends to prevail. Understanding how and why elites are recruited suggests general social tendencies toward expansion or toward consolidation. Expanding societies or subdomains recruit more on the basis of personal achievement. Consolidating groups tend to recruit based on inheritance of status. The style of recruitment reflects profoundly on social mobility, individual incentive, and discontent among social strata. Styles of recruitment affect both the composition of the elites and their outlook.

In more modem industrial societies, recruitment and selection pattern accompany differentiation and autonomy among the elites. Recruitment based on social inheritance is giving way to recruitment based on individual achievement. Recruitment may also be based on ancestry, education, experience, and training. The public elects some elites, others are appointed by predecessors or superiors. Some are born to their positions. Some elite positions are temporary, others for life.

Sources of recruitment. Some elites can be found in training or in preparation. Military academies, prestigious prep schools or universities, key postings, cathedrals and seminaries, key fraternities or clubs, and elite branches of military service are all fishbowls to spot and study prospective elites.

Rewards. This is recruitment from the viewpoint of the elite candidate. Rewards for becoming an elite may be esteem, money, power, acceptance, or merely the ability to live up to expectations. Understanding the rewards that accompany elite recruitment reveals motivation, and accordingly, sources of leverage and manipulation.

Watching Elites.

Examining the varying skills, styles, and backgrounds of elites reveals truths about the complex system they represent. The activities of these elites will in many ways reflect the desires of the heterogeneous populace they represent.

Finding Elites.

The analyst identifies elites through research. Excellent sources are:

- US Intelligence agencies (CIA, DIA). Call the desk officer for the country, and ask.
- The US International Information Program formerly USIA). Call the desk officers in Washington and in country, and ask.
- FBIS. Review the names of key parties to major events.
- Embassies, attaches, and mil-groups. All of these have up-to-the-minute information on local elites.

III. Analytical Questions.

- How does or will a circumstance or policy affect the elites?
- How do they exert pressure, influence, or power? What kind of influence? When and why do they do it?
- What are the rewards for this type of elite? Are the rewards threatened?
- Who are the elites in this society? What segments do they represent? What categories are there?
- What functions do they perform?
- What functions does the segment perform? Who does it represent? How are they recruited? From where? Are there limitations?
- Where do the elites come from? Is there a pattern?
- What is there about this elite that reflects societal patterns or trends? (If this elite is also a leader, see the questions in "Leadership".)

IV. Inter-Relationships with Other Political - Military Factors.

- History: Elites represent the historical movement from aristocracy and oligarchy to pluralistic ideologies. Often major historical events defined what are now the traditional elites.
- Natural environment: Sources of elites may be tied to environmental realities, as in the landed agricultural elite of Argentina, or the oil sheiks of the Middle East.
- Political systems: By definition, elites hold key political positions, and the nature of the checks and balances associated with those systems limit or define the associated power and influence.
- Political economy: Traditionally, wealth is a major identifier of elites. People who control wealth, such as major industrialists, form an important segment of elites in capitalistic societies.
- Role of the military: The military presents a source of elites in most countries.
- Ideology: Some societal segments or subdomains are defined by ideology. The paragons of each ideology become elites, and are strategic elites if the holders of that ideology exert power and influence.
- Religion: Like the military, organized religion is a societal segment or subdomain that is a source of elites.
- Foreign influence: From a reverse perspective, elites may be the targets of foreign influence. The Pope influenced the religious elites of Latin America by promoting "liberation theology", which enabled political activism by the Catholic clergy.
- Leadership: (see "Leadership" chapter)
- Regional Perspectives: As the representatives of various societal segments or subdomains, elites are the repository of a culture's point of view.
- National interests: Elites manifest themselves by exerting influence and power to define national interests in their favor, or to resist national policy that is not in their favor.
- Ethnicity: Ethnicity can be both a recruitment prerequisite and disqualification. Each ethnic group will have elites, and if the group is influential enough, these elites will be strategic elites.

V. Conclusion

Political-Military analysts study elites because they exert power and influence. This helps to explain and predict, and to establish cause and effect relationships. When we ask, "Who gets helped or hurt?" to find a cause or predict an effect, we look first to the elites.

Chapter 13

The Cultural Environment

I. Introduction

The analyst uses culture as an important factor to explain and predict behavior. This chapter distinguishes culture from other factors and introduces the analytical aspects of culture. The chapter does not address the use of culture in your interactions in other countries.

II. Culture and Society Defined

For our purposes, culture is learned and shared attitudes, values, and ways of behaving in a society. Culture includes customs, folkways, manners, mannerisms, etiquette, behaviors, body language, gestures, celebrations, milestones, dress, outlooks, perceptions, and thought patterns. It is embodied in history, art, myths, legends and heroes. It addresses appropriate responses to situations. It determines the circumstances and quality of apology, retribution, reward, punishment, equity, commiseration, disdain, shame, guilt, congratulations and pride. It selects and applies social sanction and reward. It expresses itself in superstitions, outlooks, perspectives, conventional knowledge and points of view. It encompasses the sense of time, individuality, possessions, sharing, self-worth and group-worth. It establishes the social hierarchy, defining roles by sex, age, position, religion, wealth, family and profession. In essence, culture defines what is and is not okay, accepted, and normal.

Culture also includes what you may call "Big 'C' Culture." This culture includes the fine arts, theater, famous artists, films, music, dance, and literature.

Culture relates to society. Society refers to those regularized mutual patterns of behavior among a specific group of people who share a geographical area and culture. Attitudes, values, and patterns of behavior characterize a society. These patterns of behavior demonstrate social organization; i.e., reciprocal rights, duties, and expectations between individuals in the group. Society and culture are interdependent concepts. One cannot exist apart from the other. However, they are not the same. Society refers to people and their social organization, while culture refers to their learned and shared way of life.

Because of differences in environment and historical experience, members of different human societies exhibit widely different patterns of behavior. Since social behavior is based upon commonly held ideas or notions of what is the correct response to a given stimulus, the most basic differences between peoples in different societies lie in the realm of ideas.

Culturally defined groups share a sense of common identity among members. This common identity works at different levels. It might be characteristic of a subgroup of society--a club, profession, or descent group. At its broadest level, it might include a collectivity called an “ethnic group."

Groups, Norms, and Values

Groups. Since we define culture as learned and shared behavior it is clearly a group phenomenon. Accordingly, an understanding of group structure and process illuminates culture. All societies are comprised of a number of groups that may be related to each other in various ways. Political-military analysis requires that the analyst correctly identifies important groups in a society and correctly assesses patterns of behavior (culture) characteristic of each group.

Primary and Secondary Groups. Behaviorally, a primary group refers to groups that are small, intimate, and informal. The family is an excellent example of a primary group. In Africa, a lineage segment (of closely related kinfolk) in a local area would be another good example. Secondary groups, on the other hand, are utilitarian, formal, and impersonal. School classes, student bodies, labor unions, and PTAs are examples of secondary groups. In America, a religious denomination would normally be a secondary group. In Senegal, an Islamic religious brotherhood might well be a primary group. A person's primary group associations are usually more important to him, and will more likely affect his behavior than his secondary group associations.

Folkways, mores, and laws profoundly influence how one society will interact with another. They can have a significant effect on interstate relations. For example, a Judeo-Christian ethic--a Western model of appropriate behavior--results in certain expectations by Americans that others share our concern for individual human rights, whether or not the foreign cultures share the same ethic. A political-military analyst is expected to be able to assess the influence of folkways and mores on the formulation of national policies.

Acculturation (Acquiring Cultural Competence)

Society's purpose is to make each member a fully responsible and functional individual within the whole. Accordingly, it does whatever is necessary to aid any one of its members to learn proper and appropriate behavior for any given social setting or situation. The individual, in becoming culturally competent, subordinates his dreams and expectations to the shared rules and requirements (norms and values), not only for the larger society but also for every specific demand within the life as a whole. The intent of society is responsible participation. Most members of the society eventually absorb the ideas and are appropriately "acculturated."

Obviously, a native-born adult member of a foreign society has a natural advantage over the analyst who is trying to acquire 30 years' cultural competence in two or three years. However, outside observers are often more insightful than insiders because of a lack of an agenda or embedded prejudices.

Social Controls

Society imposes cultural competence through social controls. A society's regular and expected patterns of behavior are called norms, and society expects its members to live by them. These norms are embodied in folkways, mores, and laws. As you might expect, not everyone in a given society always follows the norms. It follows that all societies have mechanisms for

social control. These mechanisms operate at different levels.

The lowest level of mechanism for social control is "folkways," which are the manners and customs of a culture. They catalog the "normal" way to do things. Although these are taken very seriously, law does not enforce them, and failure to follow them is not considered an act of immorality. Folkways usually refer to behavior-like manners, dress, greetings, and other such activities. The observance of folkways makes for smooth interactions in society. Rewards for compliance include acceptance, inclusion, and esteem. Ridicule, avoidance, negative comments, and similar mechanisms usually enforce them negatively.

"Mores" are more powerful social controls. These might include sexual and marriage rules and other requirements of virtuous conduct. Mores are social rules and regulations of a moral nature. Their observance furthers membership, inclusion, regard and esteem. Various sanctions enforce them, although again, scorn, ridicule, isolation and exclusion are the primary mechanisms. Society permits its members to withhold from a transgressor any discretionary good thing.

The highest level of social control is that of laws. Laws are rules and regulations that are enforced by the state. The state may legitimately use force to assure compliance. Laws usually grow out of folkways and mores.

Culture, Change, and Predicting Behavior

Ideas, models, norms, values, and behavior are always changing. Usually, the changes occur so slowly that most members of a society easily accept them. However, a variety of factors can accelerate change to the point that local models, ideas, and social organization cannot adequately cope. This is frequently the result of changes in the natural environment (drought, epidemic disease) or changes in economic conditions associated with national development.

Conditions of accelerated change often provoke regional tension, instability, and strife. The political-military analyst anticipates such circumstances and predicts the outcomes. This involves explaining and predicting how individuals in specific groups will act in response to social change. It requires an understanding of the key themes, models, and patterns of behavior in that cultural context. At the same time it necessitates a good historical perspective--an ability to recognize tendencies and patterns in similar circumstances in the past. Finally, it requires that the analyst clearly understand the range of viable economic and political options available to the group under study. Often, the analytical techniques provided by the disciplines of economics, political culture, and political science can apply.

Of course, to perform this role competently, the analyst must not only understand the processes of cultural adaptation to change but also the dynamics of change in specific natural environments and natural economies.

Language

To the extent that thought and language are interdependent, language is key to understanding

culture. No culture can be completely understood without understanding the language. Languages will be rich in words about what is culturally important, and poor in words that have little cultural significance. However, knowing the language in no way indicates mastery of the culture.

Ethnocentrism and Cultural Relativism

Ethnocentrism and cultural relativism are opposed approaches to understanding and explaining behavior in foreign-cultural contexts.

Ethnocentrism is the practice of interpreting and evaluating behavior and objects by reference to the standards of one's own culture rather than by those of the culture to which they belong. It results from the acculturation of the analyst that has internalized his own culture's norms. This internalization generates the notion that his culture's norms are superior to all others.

An ethnocentrist carries the notion to the point of defining an action as right or wrong by the standards of his own culture. Other ways of doing things make sense or do not make sense only in this light. Ethnocentrism allows a person to be satisfied and complete within the context of his own culture. However, it embodies, engenders and communicates an attitude of superiority of one's own ideas over all others. Consequently, ethnocentrism may decrease the analyst's ability to understand, explain or accurately predict behavior in other cultures. In extreme cases, it can lead to xenophobia. The Shiite fanatics of Iran provide a classic example.

Cultural relativism is the practice of interpreting and evaluating with reference to the normative and value standards of the culture to which the behavior belongs. It views the world and explains behavior in terms of the relevant culture (the culture under analysis). In this approach, behavior is appropriate or inappropriate. It makes sense and follows patterns, based upon the norms and values of that culture. The relativist carefully avoids judging others based only on his own cultural prism.

For the analyst, cultural relativism provides access to the other person's point of view and perspective. This, in turn, provides insight, competent explanation of otherwise opaque and strange happenings, and a powerful ability to predict human action and reaction.

Although a powerful analytical tool, cultural relativism should not serve as an article of faith. Extreme cultural relativism is actually derogatory of the culture being analyzed in that it assumes the absence of universal natural laws or human traits. All people bleed when cut; all cultures prohibit stealing, murder, rape, etc. Indeed, ethnocentrism provides the analyst with familiar cultural examples to compare and contrast. It tells him how different or how the same is the culture he analyzes. Finally, it provides him with a lexicon which people of his own culture can understand when he reports his findings.

Going native. This unflattering phrase describes behavior, not analysis. The person who adapts his behavior to that of a foreign culture gains a lot in his ability to accomplish missions, avoid problems and find out information. However, some people interpret these gains as signals that they can scrap their own core values in favor of the ones under analysis. At this point, they have gone native, and are of no further use to their country.

Categories, Stereotypes and Labels

Political-military analysis selects those cultural factors (categories) that particularly influence political and military behavior in a given region, and determines their likely influence on the situation at hand. It considers local groups, local social organization, key cultural themes and values, and historically sanctioned modes of adaptation to social change. Finally, it expresses these relations with precise, carefully defined terms that clearly illustrate social dynamics.

Often, one must categorize groups of people, e.g., traditional, secular, Western, Islamic, etc. However, these labels are often very arbitrary and misleading -- they may or may not conform to the way the people themselves define their social universe. Terms in popular English usage, which Americans frequently apply to foreigners with little empirical justification, further complicate identification of social groupings. For instance, we often describe Islamic residents of the Middle East and North Africa as Arabs, even when they are of other than Arab ethnic origin. Ethnic distinctions among Africans are popularly ascribed to "tribalism," even though the actual African distinctions are often more analogous to European "nationalities" or even to economically defined social classes. While the competent analyst is obliged to use labels, he must use labels with great care, avoiding imprecision and stereotyping.

- The labels that are of most interest to political -military analysts are cultural distinctions; that is, they are distinctions based upon commonalties in ideas and behavior among certain populations. Within this very broad category are a number of subcategories. These, too, are labels that require careful use.
- Distinctions among language, cultural values, and sociopolitical cohesion also provide insight. For example, what analytical category does the word Jewish suggest? Is it a religious, racial, national, cultural, or linguistic term? Who is a Jew? It is such a complicated issue that the definition has never been officially defined in Israel. Obviously at times the term Jew has been used in all categories. For instance the term “anti-Semitism” generally refers to anti-Jewish prejudices. However, the word Semitic refers to a language family to which both Hebrew and Arabic belong. Therefore, technically speaking anti-Semitism refers to Arabs as Jews.
- Do not confuse patterns in human physical features with patterns in human behavior. Human distinctions based on differences in outward <u>physical appearances (phenotype)</u> might not correspond to differences in cultural norms and values. An example would be Americans of Asian descent who exhibit very <u>few</u> behavioral traits unique to the Asian society of their ancestors. Although some human populations do exhibit a higher incidence of unique physical or genetic traits within themselves, the analyst must avoid stereotyping groups by phenotype.

Analysts must be very careful in the use of labels. If a term that is primarily a linguistic category might not imply the corresponding social or political correlation. Not all-native speakers of English are ethnically English nor are they all subjects of the English sovereign. If the term (Hausa, Swahili, or Somali) designates a general ethnic group, a corresponding political cohesion does not necessarily apply. For example, neither foreign nor domestic scholars agree on the meaning of 'Arab'. Is it a linguistic group, a race, a culture, or simply a political term?

The word 'Arab' conjures up very different perceptions by different people in the Middle East. Must all Arabs be Muslims? Some Muslims would adamantly affirm that they are synonymous. Christian Arabic speakers of Jordan, Iraq, or Palestine would vociferously deny that. Are all people of an Arab nation Arabic? The Maronite Christians of Lebanon have died by the thousands to assert their distinct cultural identity. So it goes, and every Arab summit convened will be ripped asunder by the same unanswered question: "Who/what is an Arab?"

A clear distinction should be drawn between terms that primarily describe shared cultural identity, such as "society" or "ethnic group" or "nation," and terms that have primary reference to a governing political structure, such as "state." A political-military analyst must be able to discern the difference and understand the ramifications of this distinction for a specific region.

In many areas of the world, primary cultural identities do not correspond to state boundaries. The contradictions between the culturally specified identities of local populations on the one hand, and the identity of a recently created state on the other, force national decision-makers to devote considerable attention to nation building. By definition, this involves efforts to undermine peoples' loyalty to other institutions. India and Nigeria are good examples. Occasionally, these attempts threaten regional stability or great power interests.

Many states of Western European design are typically formal, secular, and territorial in nature. Other states contain societies with various systems of government that may or may not interface well with the national political structures. In times of transition and stress, societies often display tendencies to reacquire and redefine social or political behavior hallowed by tradition that supposedly characterized a better, earlier age. When this is combined with religious revitalization, the results can be revolutionary. The Mahdiya in the Sudan in the 1880's and the Ayatollah Khomeini's revolution in Iran are good examples of this. The political-military analyst should be able to anticipate such events by noting the historically sanctioned behavior exhibited by a society undergoing great stress.

The competent analyst must be able to sort factors and apply labels that assist in understanding social organization and behavior. He or she must know when certain factors and labels are important and when they are not. Good political-military analysis requires an incisive elaboration of the ideas behind collective behavior. To achieve this, great precision in the use of categorical labels is of paramount importance.

The following table, created by Dr. Gary Weaver on pages 75 and 76 of his book Culture, Communication and Conflict, lists many of the terms, factors, categories and labels that sociologists and anthropologists use to analyze cultures. Further study will illuminate what these terms measure, and how those measurements aid in analysis.

CHARACTERISTIC CULTURE	
Abstractive	Associative
Gesellschaft	*Gemeinschaft*
Society	Community
Urban	Rural

Apollonian	Dionysian
Heterogeneous	Homogeneous
SOCIAL STRUCTURE	
Individualistic	Collective
Small or nuclear family	Extended Family
Overt social rules	Implicit social rules
Loose in-group/out-group distinction	Rigid in-group/out-group distinction
Achieved or earned status	Ascribed status
Flexible roles	Rigid roles
Loosely integrated	Highly integrated
Class	Caste
Social and physical mobility	Little social or physical mobility
Low power distance	High power distance
PHILOSOPHIC OUTLOOK	
Mastery or control over nature	Harmony with or subjugation to nature
Melodramatic/escapist	Tragic/realistic
Humane/inhuman	Human/inhumane
Objective	Subjective
Quantitative	Qualitative
Alloplastic	Autoplastic
Mind/body dichotomy	Union of mind and body
PSYCHOLOGICAL ORIENTATION	
Psychology of abundance	Psychology of scarcity
Schizoid or fragmented	Comprehensive or holistic
Need for achievement	Need for affiliation
Abstractive and logical	Anthropomorphic & complexive
Masculine	Feminine
Direct responsibility	Indirect responsibility
Great use of extensions	Little use of extensions
Extension transference	No extension transference
Steep pleasure gradient	Flat pleasure gradient
Weak uncertainty avoidance	Strong uncertainty avoidance
Guilt-internal	Shame-external
THOUGHT PATTERNS	
Analytic	Relational
Theoretical learning and knowledge	Experiential or kinesthetic learning and knowledge
Dichotomous/divisions	Holistic/joining together
Linear-separations	Nonlinear-comprehensive
Abstractions/prose	Imagery/poetry
BASIC VALUES	
Doing	Being

Change/action	Stability/harmony
What/content	How/style
Individualism	Belongingness
Independence	Interdependence/dependence
Self-reliance	Reliance upon others
PERCEPTION	
Mind/body dichotomy	Mind and body are one
Monochronic time/action	Polychronic time/action
Linear or segmented time	Nonlinear or comprehensive time
Future orientation	Past or present orientation
Space/objects separated	Continuity of space/objects
Subject-object	Subject-subject
Nonsensual and non-senseful	Sensual and senseful
INTERACTION	
Low-context	High-context
Competition	Cooperation
Verbal emphasis	Nonverbal and verbal
Written or electronic	Face-to-face
Impersonal	Personal
Schizoid/fragmented relationships	Holistic/interdependent relationships
Monological	Dialogical
Practical/aloof	Nonpurposive/involved
Easy to break action chains	Difficult to break action chains
Systematic	Spontaneous

Imperatives for Cultural Analysis. Use the following to direct your use of culture as an analytical factor:

- Be a cultural relativist, but not an extreme one. Adjust your point of view, understand the other person's position, and empathize. "Table" your own point of view for the purpose of explanation and prediction, but never abandon it. Do not 'go native' in thought or deed.
- When you find yourself thinking: "These people are (dirty, stupid, lazy, immoral, evil, etc.)," you are probably being ethnocentric.
- Most people in a culture behave appropriately. Inappropriate behavior happens less often in all cultures. Hence, if most everyone behaves in a certain way, it is appropriate to the culture. This provides predictability to reactions. Most people react appropriately.
- All differences between one culture and another culture are positions on a continuum, without a fixed scale. That is, you can say Germans value family more or less than Spaniards, but you must resort to examples to demonstrate how much more or less.
- Cultural generalizations, although sound and valid, suffer from the same defects as all generalizations: you particularize them at risk. You might use your knowledge of machismo to predict a Mexican election, but you may not assume any particular Mexican man is macho.
- Cultural generalizations are often snapshots in situation, time and place. You can expect that

many cultural truths change over time, that they vary between urban and rural situations, and that they may erode with the advent of global mass media, industrialization and other forms of development.

III. Interrelationships with Other Political-Military Factors:

- History. History explains culture as it follows the evolution of society over time. History explains the ways in which a population has adapted to the combination of its natural environment and other forces over time. History catalogs the external and internal influences and events that condition a society, and records the reactions. History provides the examples of how culture predicted and explained past events.
- Natural environment. Societal adaptation always includes accommodations or exploitations of the natural environment.
- Culture and Religion. Religion and culture overlap, especially where religion is dominant. Religion often exerts social control, prescribes and proscribes behaviors, and embodies perspective and outlook. Religion may form societal groups or establish a social hierarchy. These and other functions of religion are also functions of culture and society.
- Ethnicity. Again, ethnicity and culture overlap. In some cases, ethnicity and culture are nearly identical.
- The role of the military. Attitudes about and within militaries are cultural. Militaries form very cohesive secondary groups with exceedingly clear social controls, norms, and behaviors. Acculturation is so thorough and universal in military organizations, that soldiers are predictable over a larger span of behaviors than almost any other secondary group.
- Mass media. Mass media serves to dilute culture. Soap operas, commercials, movies, and international news all provide examples of people acting successfully in different ways. The portrayed people may accept or receive rewards for behaviors, which are locally unacceptable. They may receive sanctions for doing things, which are locally acceptable.

Sources of region-specific cultural information.

- Brigham Young University publishes a Culturgram for every country in the world. These are extremely rich and concentrated sources of cultural information.
- Travel guides available in most bookstores will have introductions, capsules, or whole chapters of cultural information.
- Tourist bureaus and chambers of commerce of many countries publish cultural hints (usually flattering), often on websites.
- U.S. embassies will direct you to a culturally savvy office in the country team of most countries. Often this will be USIA, which manages a cultural interchange.
- Foreign embassies in the United States will publish or direct you to cultural information about their country.
- Language texts and dictionaries provide great insight into what is important in a culture, especially if the text distinguishes usage from country to country.
- Foreign books, magazines, newspapers, films radio and television programs provide familiarity with almost all components of the culture under study.
- Language immersion programs normally include a substantial cultural component.

IV. Analytical Questions.

- What are the modal personality traits of the people of the area you are studying?
- How does language act as a mirror of the society? Is language a cohesive or divisive element? Does language coincide with class and/or racial divisions?
- How are the roles of men and women defined in this culture? Is there a major difference between the *hoi polloi* and the elite? To what extent does this affect your study of the culture or more importantly, operating within it?
- What are the basic values of this society? How do they translate into a worldview?
- What are the major environmental determinants affecting the shaping of culture in this society?
- What is the impact of the prevalent cultural attributes on the political system and popular view of government?
- What is the prevalent view of the individual, vis-à-vis the family and state?
- What are the significant sub-cultures within the area you are studying?
- In Weaver's chart (above), where does this culture fit on each of the scales? Which of these have operational importance in explaining and predicting?

Chapter 14

Religion

I. Introduction and Definitions

Religion is one of the most important and pervasive phenomena in the human experience. Even someone who does not himself subscribe to any particular religious belief cannot help but be struck by the influence religion has had on societies and cultures around the world and over time. It has permeated the collective psyche of mankind. It has inspired much of the world's finest art, literature, dance, drama, music, and architecture. We use religious occurrences to mark time, such as A.D., B.C., A.H. Religion has influenced the types of political systems under which we are governed, the economic systems in which we trade, and the social systems in which we live. There is no example in history of a culture without religion, and all governments and states that have tried to eliminate religion have failed. People have endured the most horrible of pogroms and oppression and have made great sacrifices to cling to their religious beliefs. Even in societies normally held to be secular or "non-religious," e.g., Western democracies or Confucian China, religion has been and remains a basic and powerful social force. Across time, space, and cultures, the search for gods is a constant theme in the community of man.

Do not argue the rightness or wrongness of religion or promulgate a particular religious belief. Instead, define what religion is, the role it plays in various societies, and how it is studied. From there, try to figure out what effect a particular religious belief has on the political, social, economic, and cultural fabric of the society in which the religious order exists. Remember that political-military analysts are not theologians.

Religion Defined

Religion develops from man's feeling that because there is so much in this world that is beyond his control, he himself is not the final answer and, therefore, there must be something greater than he. Once he accepts this concept, he will try to modify his behavior to coincide with what he perceives as the edicts of that greater power. Religion, then, is both the inner experience an individual has when he senses a supernatural force and the ways in which he tries to bring his own personal and social life into harmony with that force.

Since religious practice always involves some sort of community, the term “religion” is commonly used to refer to an organization of people who subscribe to similar beliefs and practices. There is a difference in focus when referring to religion, on one hand, and a religion, on the other.

Common Traits

There are several religions in the world today that differ dramatically from one another and which among them have thousands of sects. However, all religions have at least three traits in common. These traits are a belief in a force superior to man, a code of conduct, and the

concept of transcendence.

The first trait, already alluded to, is belief in a force superior to man. This may be a god, a pantheon of gods, or an impersonal, abstract force. Most Western religions have personal gods, which are individual beings. Some Eastern religions instead believe in a creative principle or force.

The second common trait is a code of conduct, which will assist the believer in harmonizing his life with the divine will. This code is often the foundation of a society's moral and ethical systems, such as the Ten Commandments of the Judeo-Christian tradition or the Eightfold Path of Buddhism. (Morality is a way of living based on precepts believed to be true. Ethics is a way of explaining, defending, or construing moral action.)

The third trait common to religions is the concept of transcendence--that we can somehow escape this world. Every religion will have transcendence as its ultimate spiritual goal, whether by following moral rules as a path to an other-worldly paradise, by practicing forms of physical or mental discipline to escape the endless cycle of desire and suffering in the world through enlightenment, or by devoutly appeasing the gods through prayer and ritual.

Eleven Components of Religion

A comparison of two or more religions can be made by looking at several different aspects. The first aspect is the numerological belief; e.g., the types of supreme power the religion reveres. Is it based on an impersonal Absolute, on personal monotheism, or on polytheism?

Second is the historical aspect. Who, if anyone, is the founder of the religion? Is he real or mythical? Where and when was he born? What was his life like? When and under what conditions did he found the religion? Did he claim to be of supernatural origin or to have a special relationship with the deity? How did he die and when? How did the religion spread and develop over time?

Third is the revelatory aspect. Is the religion based on a revelation to the worshipers from the deity (such as in Christianity, Judaism, or Islam), or is it based on self-discovery (such as in Hinduism, Buddhism, or Taoism)?

The fourth aspect is the cosmology of the religion. How and why was the world created? Is it real or illusory? Is it eternal? If not, how and when will it end? Has it ended before, only to be re-created? Are there several dimensions of it?

The fifth aspect consists of the anthropological beliefs. How does the religion view man and human nature? What is man? How did he come to be? Why? What is the value and purpose of life? Do only humans have souls or is all life valued equally? Is man immortal? Will he live again? Must he?

Views toward proselytzation and excommunication comprise the sixth aspect. Is the religion a missionary religion? How does one qualify for membership in the religion? Is there anyone who can be forbidden membership? What means can be used to obtain a conversion?

Under what conditions can a member be expelled? Once expelled, can he be readmitted? If so, under what conditions?

Sociological precepts comprise the seventh aspect. What types of earthly social order does the religion call for? Are all believers equal before the Divinity? Who is not equal, on earth or in heaven, and why? What types of roles do people play in both the religious and secular communities? How is religion used to determine who plays what role? What types of interpersonal relationships are called for? What types of segregation or integration are established and on what basis? Who are the leaders? Who are the followers? Why?

The eighth aspect deals with the soteriology (the study of salvation) of the religion and addresses the concept of transcendence. Is the spiritual goal of the religion salvation or liberation? Have they already been chosen, or does everyone still have a chance to gain enough merit to achieve the goal? How is such merit gained? How is the goal achieved? Is it possible to know that one has achieved it prior to death? If we achieve it, what happens then? What happens if we do not achieve it?

The ninth aspect is the sacramental component and deals with that which the religion holds as sacred. This has several aspects.

o Sacred space and time. What are the sacred places of a religion? Why are they sacred? What is the proper conduct within them? What are the sacred times--usually celebrated as holidays--for the religion? Why are they considered holy? What is the proper form of celebration? Sacred events usually occur in sacred places and times. Sacred places are those locations where one goes to worship. They may include shrines, temples, and churches as well as rivers, mountains, and promontories. The places and dates of the founder's birth and death are normally held to be holy, as are the place and date of the founding of the religion. Even those religions that lack this type of historical grounding will often see the place where the believers dwell as the Holy Land and will have religious festivals and holidays to mark certain occasions.

o Sacred words and writings. This category can be broken down into at least three subdivisions. First are the scriptures. Is there a Holy Book or Books? Is it held to be the word of God? Is its author known? Was there only one author or many? Is there only one acceptable scriptural language or may any language be used? The second subdivision is sacred stories. These may be in the scriptures or may be secondary works. They may be based on fact or be legends, myths, or fables, but are generally allegorical. They are a profound aspect of any religion if for no other reason than to tell us how people see themselves in relation to their god. For example, Shintoism says the Japanese islands are godly creations and their inhabitants are descended from gods; the Judeo-Christian tradition holds that man was created in God's image, but fell from grace in the Garden of Eden; Hinduism says that the four social castes sprang from parts of Brahma’s body--the lower the body part, the lower the caste. The third subdivision of sacred words is the moral code contained in scripture and stories. It may be laid out explicitly or merely implied.

o Sacred people. These may be historical, legendary, or contemporary. They can be divine, such as the Dalai Lama or the Japanese emperor; semidivine, such as Christian saints;

mortals with a special connection with the gods, such as a shaman or a witch doctor; or simply mortals with special training, such as priests, preachers, monks, or imams. Part of studying sacred people is to determine if the religion has a clergy. If so, who are they? How are they selected and trained for their profession? Are they venerated? Can anyone join the clergy or are certain categories of people (e.g., women) excluded? What is the clergy's relationship with the population at large?

o Sacred symbols. All religion is symbolic in that it is an outward manifestation of an inner experience. If man could not symbolize, there could be no religion. Symbols may be verbal, such as invocations like "Praise the Lord," "Amen," or "In the name of Allah, the merciful and compassionate." They may be actions, such as bowing the head and placing our palms together to pray or making the sign of the cross. Symbols may also be physical, such as the Kaaba, Buddhist and Hindu statues, or the Crucifix. Some sacred places or writings are also sacred symbols. For example, Christians swear on the Bible, while Muslims face Mecca while praying.

The tenth aspect of religion we can study is its ritual and rules of worship. Ritual is one of the most important aspects of religion. There are rituals for every aspect of life from birth to marriage to funerals. There are rituals for daily prayer; for celebrating holy times and for worshipping in holy places; for asking the gods for a good crop during the planting season and for thanking them when the crop is harvested; for choosing sites for houses, shrines, and graves and protecting those sites from evil once they are chosen. Even if we worship privately, we tend to so with socially acceptable rituals. When studying these rituals try to determine what they mean and why. What is the tradition behind them? Who can perform the ritual? Where and when? Who can observe or participate in it? Who is expressly forbidden from observing or participating? Why? Do believers worship as congregations? Must they? How does the believer prepare himself for ritual or worship? How does the ritual for congregational worship differ from the ritual for individual worship? Is the purpose of ritual and worship to gain favors from the gods or to avoid their wrath?

The final aspect of religion is the difference between the Little Tradition and the Great Tradition. There is no religion today that is practiced purely as espoused by its founder or indeed as espoused by its current believers. In religion, as with culture in general, we must distinguish between what is said and what is done, what is preached as the ideal and what is really practiced. With religion, however, this concept becomes more complex. Robert Redfield said that there are two ways of expressing religious motifs. One is what he called the Great Tradition. This is intellectual, literate, scholarly, elitist, orthodox, and it has a long-term perspective oriented on history. The other means of religious expression Redfield called the "Little Tradition." This is illiterate or non-literate, oriented on the present or on cosmic time. It is the religion of the common man and is transmitted by family and community rather than through formal training. The Little Tradition is the religion of myths, festivals, local shrines and temples, and local gods and spirits. The Great Tradition is the religion of scholarship; debate; beautiful cathedrals and churches; and omnipotent, omniscient, omnipresent deities. The Great Tradition is the religion of the priest, whose responsibility lies in maintaining the whole social and religious order for the long-term welfare of the believers. The Little Tradition is the religion of the shaman, who deals with the exigencies of daily life and the immediate and temporal

welfare of his clients. For the political-military analyst, the Little Tradition may often be more important, because it has a greater influence among the common folk. The practices of the Little Tradition and its shaman may allow for a channel of communication or manipulation.

Five Levels at Which Religions Operate

The religion one espouses is usually an accident of birth. To be sure, there are normally provisions in the religion for conversion, but most people who subscribe to a particular religion today are not converts. They are members of a particular religion because their parents were. In fact, in many societies, one does not "join" a religion per se, since religion cannot be separated from the totality of life; e.g., Hindu India or Islamic Arabia. For most people, religion is an integral part of their day-to-day existence, not just something they do two hours one day a week between brunch at the officers' club and mowing the lawn.

Religion can operate on at least five levels in a society. These are individual, social, economic, military, and political. Since societies are made up of individuals, we include the individual level as our first. Religion meets man's basic psychological need to come to terms with the world around him. As one wag has said, "religion lets us explain the inexplicable, ponder the imponderable, and 'unscrew the inscrutable." It provides comfort and guidelines man can find nowhere else.

o Religion gives man a sense of self. Some even define religion as that which allows man to come to terms with his real self. As such, it gives one a sense of belonging and maybe even well being. It helps answer questions like who am I? Where did I come from? Why am I here? What happens when I die? How and why was the world created? What am I to this world? Religion often helps us feel that no matter how insignificant or inconsequential we may be to our fellow men, we are important at least to our god. He/she cares for us, even if no one else does.

o Those who come to grips with their true selves often feel that they can now see the world more clearly, that they have reached a higher state of consciousness. This can be a deeply personal religious experience, usually described as achieving a state of inward joy, or serenity and inner peace. Some may feel as if they have been enlightened or have "seen the light." Many feel as if they have actually been "born again," leaving behind their old life to begin a new one in service to their god. To many people, this is the most important aspect of religion.

o Religion also helps people establish personal moral codes. For many, "good' and "bad" and "moral" and "immoral" are relative and arbitrary; therefore, they are meaningless, without the sanction of a divine will behind them. These codes may address behavior as mundane as proper clothing and eating habits or as serious as sexual relations and the sanctity of life. Religious codes help people make tough choices that might not otherwise be made. With a religious code, choices and options are prescribed by a Higher Authority.

o The final facet of the psychological level is its power to encourage acceptance of one's role in life while, paradoxically, giving hope for something better at another place and/or time.

Religion helps the common man go through hell. He accepts his fate because it is ordained by karma and dharma, because of kismet or God's will, or because there is a better world waiting for the meek on the other side. Religion can also inspire hope. Men beseech their gods for protection, help, wealth, and health. Through religion, personal concerns are met with religious truths. Religion may well have risen out of man's realization that in this world we are ultimately all alone. Religion helps us prepare emotionally and intellectually to bear with those aspects of human existence that are beyond our control. There are some that posit that the purpose of religion is not so much morals as it is morale. As Will Durant has poignantly pointed out, "As long as there is poverty there will be gods." But never be mislead into believing that religious fervor is a function of an economic environment. Many of the post-modernists would have you believe that a poverty-free society would discard religious beliefs. This has time and again been proven to be more of an ideological wish than reality. For instance the wealth of the Kuwaiti citizen has not diminished an increasing movement toward a more strictly interpreted Islam.

The second level at which religion operates is social. Religion always finds expression in some sort of community. In fact, for a belief system to be considered a religion, it must have at least two adherents. They may be considered heretics, but at least it is accepted that they have a religion. If only one person holds a belief system, he is merely considered mad. Religion operates on the social level in several ways.

o One social function of religion is that it provides a definition of the community. Just as religion always is grounded in a community, so do communities define themselves at least in part by reference to religion. This may in fact be the central concept of the community's collective identity, such as in pre-World War II Japan or modern-day Israel and Pakistan. The religion may also stipulate that certain non-believers be accorded conditional membership in the community, such as Islamic perceptions of Jews and Christians as "People of the Book." Finally, religion also helps identify “them” Vs “us.” Non-believers are then classified as "infidels," "pagans,” "heathens,” or "heretics" or as simply the uninformed.

o Another social function is to establish a normative standard for social organization and conduct. These standards normally regulate social relationships and may address everything from sex, marriage, and male-female relations in general to filial piety, teacher-student relations, and relationships at the work place.

o The third social function of religion is social legitimization. It can be used to justify a social system or to support its overthrow. Members of the society may be encouraged to accept their lot in life because God has willed it so. Those who are better off in the society enjoy their status and wealth because they are the chosen of God. Similarly, if the social system is at odds with a religion, the religion can be used by its believers to incite rebellion.

o The fourth social function is social mobilization. Religion can serve as the focus or impetus for social action. Many charitable organizations are religious-based, and some religions call for believers to care for the less fortunate. For instance within Christianity the Protestant movement put emphasis on personal salvation through faith while Catholicism has

emphasized good works as being in tandem with faith. Similarly, a community's religious center may also serve as the social center. Many social activities are oriented on religious events, times, and places. Religious leaders often serve as social leaders and are in some cases more effective in this realm than political figures.

o The final social function is scholarship. Religion has historically been one of the main vehicles used to promote literacy. People learn to read in many parts of the world by studying scriptures. A basic textbook in many Islamic countries is the Qu'ran. Monks and other religious leaders often double as teachers. Universities and other institutions of higher learning have been established in the name of most major religions. Similarly, missionaries of several denominations have established schools around the world. Many of these schools have had a significant impact on the education systems of the countries in which they were established, even if efforts to proselytize were not especially successful. Religion, as interpreted by more devout clergy, however, may also retard scholastic, or more properly, scientific progress, by proscribing the study of certain subjects or by dictating how facts may be interpreted, understood, or presented. This is generally very rare and more of an ideological mantra than a reality.

The third level at which religion operates is economics. Religion generally encourages certain types of economic practices while prohibiting others. Economic topics religion can address include the distribution of wealth, welfare responsibilities, taxation, banking practices, economic development, investment, use of material resources, acceptable occupations or vocations, and economic relations with other countries. For instance within Islam usury or interest loans are forbidden. The American Catholic bishops regularly issue tracts on economic justice.

The fourth level at which religion operates is the military. Is military service compatible with religious beliefs? Under what conditions? Who serves? Who is prohibited from serving and why? Who fights and who only serves in supporting roles? With whom do we fight, why, with what, when, and under what conditions? Is special merit gained by fighting? How is the enemy to be treated if captured or defeated? What can we expect from the enemy if we are captured or conquered?

The fifth level at which religion operates is politics. There are several aspects to this.

o Religion may promote or oppose certain types of legislation, such as those regarding birth control or abortion, divorce, taxation, or child care. On the other hand, the government may be compelled to pass laws that circumscribe religious practices regarded as unhealthy or pernicious by the society as a whole, such as polygamy.

o Religion can be used to promote national integrity among a country's peoples. Countries as diverse as Israel, Pakistan, and Burma have appealed to religion as a way to overcome ethnic or other divisions among the citizenry. On the other hand, religiously pluralistic societies such as Malaysia and India have had to overcome religious differences in their struggle for national unity. Some countries, like the United States, have even stressed tolerance of religious differences as a means of encouraging national integration.

o Religious organization or principles can be used as the focus for political mobilization. Even secular leaders of parties may appeal to religious values as an attempt to gain support from the polity for their positions on issues considered secular by some.

o Religion can also be used to justify support of opposition to political regimes or political programs. This is common in Islamic countries.

o Religion can influence the political system through its influence on individual leaders. The religious belief of political leaders can have a significant impact on the efficacy of a government or on its policies. The deep religious convictions of America's President Carter or, Iran's Ayatollah Khomeini are cases in point.

o Religious influence on government need not be limited to a few leaders here and there. In some countries, especially those with political systems that are specifically religious-based, political representations may be determined by religious affiliation. A certain number of seats in the legislature or certain numbers or types of government jobs may be reserved for particular religious groups. The Iranian majlis, (parliament) for instance, has seats reserved for Christians, etc.

o The final political area upon which religion may impact is foreign policy. Nations may band together over certain issues in a display of religious solidarity or may side against another nation for religious reasons. Examples are non-Arabic Islamic nations who side against Israel on many issues to show their support for their Islamic brethren, or the U.S.-Israel relationship, which is based at least in part on the Judeo-Christian connection. The Organization of Muslim Countries (OIC) is one such example.

Aspects That Exhibit Political Influence

Of the five levels of influence a religion may have in a society, the political-military analyst is, of course, most interested in the political level. Donald E. Smith has identified five aspects that can be studied to determine how much political influence a religion may exert. Naturally, none of the five dictate a given level of political involvement. They merely indicate whether or not such a proclivity exists.

The first aspect is how the religion views history. Religion will help determine how history is remembered, interpreted, and used. If history is seen as unreal, the believers will be unconcerned with political power. If history is seen as crucial, then believers will be more prone to seek political power as a means to influence the course of history. Islam is an example of a religion deeply imbedded in history to the extent that history before the advent of the Prophet Muhammed is called the era of Jahaliya- the era of ignorance.

The second aspect is tolerance of other religions. Generally, the more tolerant a religion is of other religious beliefs and practices, the less politically active it will be. On the other hand, intolerant religions encourage garnering political power as a means to suppress what are seen as heretics or apostates. More frequently demagogues use religion and its presumed uniqueness to demonize other groups out of political expediency. Islam is unfortunately used by political

demagogues as a vehicle in this context.

The third aspect is ecclesiastical organization. The better organized a religion is, the better suited it is to political action, at least in general. However Sunni Islam is an exception to this in that they have no structured clerical hierarchy but on a grassroots level exert considerable power.

The fourth aspect is the way the religion views Church-State relations. If there is a clear distinction between ecclesiastic and political roles, the less politically influential the religion will be. If no such distinction is made, the odds of political involvement increase.

The final aspect is social regulation. The more a religion stipulates regulation of social life, the greater the areas of potential conflict between religion and other aspects of the society. The believers may then seek political power to resolve such disputes in their favor. Conversely, the less regulation called for by the religion, the fewer points of conflicts there will be, and there will not be as great an incentive to seek political influence.

Caveats for the Study of Religions

Shamanism and animism are still very much alive today, especially in the civil affairs/psychological operations arena in developing countries. The political-military analyst may find that this considerably complicates his attempts to study the religions of his regions.

Distinguish between communalism and religion. It can be bewildering to see adherents of religions that preach tolerance and love, killing one another in the name of their religions. This does not necessarily mean that they do not believe in their religion, just that other concerns take precedence. In this case "love thy brother" may be construed to mean "kill thy non-brother."

When studying a religion, attempt whenever possible to distinguish between major sects and denominations. Learn what it is that makes them different. In some cases, the differences may be so great as to make them all but separate religions.

Religion is an integral part of a culture, but it is only a part. There are many different aspects of life and culture that will distinguish people from one another, no matter how close their religious beliefs. A Japanese Christian is still Japanese, and a Javanese Muslim is still a Javanese. Their affiliation with Christians and Muslims in the United States or the Middle East, while important, are not nearly as significant as the differences among them.

Religions may change over time, although the irony is that in trying to maintain "relevancy" they may secularize themselves out of existence by attempting to fit within the current zeitgeist. A myriad of social, political, economic, and intellectual forces are constantly buffeting religious concepts. Religious teachings and practices must confront these but carefully as to avoid becoming a therapeutic "feel good" exercise. The constant drumbeat to modernize the belief system usually results in it becoming irrelevant as the deep rooted need for spirituality

leads people to more traditional belief systems.

Religions have a fundamental paradox in that the basic legitimating idea--the spiritual goal--is unattainable in this life. One must die to get to heaven or achieve Nirvana. This has not proven to be a handicap, as shown by the influence religion has retained even today. It may in fact be one of the reasons religion has remained a powerful force. If the goal were in this life, once it was achieved, there would no longer be any reason to continue adhering to the religion.

The worst thing political-military analysts can do is put religion in a purely secular context. Adherents believe what they do on faith. For them, their belief is true and not open to dispute. Similarly, miracles are quite real for believers. What to us may seem commonplace, coincidental, or just plain phony--such as faith healing, speaking in tongues, or water stains that look like a religious figure--can be major religious experiences for someone who believes. It is counterproductive, to try to dispel these believers or to convert them. Besides, the mission of a political-military analyst is not to gain converts or correct what he may see as misperception--it is to understand the religion and use that understanding to accomplish the mission. The political-military officer should also be aware of the danger of allowing his assessments to be influenced by an attraction to the powerful appeal of a number of traditional non-western religions.

II. Interrelationships With Other Political-Military Factors

As we Americans are imbued in most cases with the idea of the separation of Church and State, we have difficulty understanding those many cultures in which separation of religion from government or any other sphere of human activity is unthinkable. Within Islam, for instance, the persuasiveness of the religion has a profound influence on every aspect of the sixteen factors. For instance there is a whole field of study on Islamic economics. The Qu'ranic and Hadith prescribes very particular ways of conducting business and the use of wealth, advocating social justice and governing other aspects of economics. Within Christianity the concept of social justice is particularly emphasized subject. The "just war " concept is a facet of Christian theology, which was widely discussed during the 1991 Gulf war. The view of Islam toward "jihad" and the interrelationship of the military and use of force in the "house of peace, house of war" concept must be understood by those assigned to the Middle East. The interrelationships between political systems, ideology, and religion must also be recognized. The interplay between ideology and religion is often so intense as to make them appear inseparable. For instance the "Islamists" have basically abducted the religion of Islam and transformed it into an ideology with a "heaven on earth" millenarianism to obtain power, and institute a political system of their own preference.

III. Questions To Be Considered

1. What is communalism? Discuss in the context of the country under study.
2. Discuss how a religion exhibits political influence as structured in the Smith outline, i.e., aspects that exhibit political influence in your area of evaluation.
3. How does religion intersect with political ideology and political systems? How powerful (or weak) is it in the nation under study.
4. How does religion of the region affect the conduct of warfare - if any?

5. To what extent is the religion or religions of the country a unifying or divisive element in society?
6. Is the religion compatible with technology and modern science? Is it all encompassing or a general guide?
7. Define the national impact of history on religion and religion on history.
8. What are the general trends in the country, i.e., a move toward secularization or a revival of religious fervor?
9. What is the relationship between the leadership and secular leadership?
10. What influence do religious leaders have over the populace in matters of state?

IV. Conclusion

Religion is a complex and fascinating topic. As stated earlier, even someone who does not believe in a particular religion must respect it as a major social force. William and Ariel Durant put it eloquently when they wrote--

"Even the skeptical historian develops a humble respect for religion, since he sees it functioning, and seemingly indispensable, in every land and age. To the unhappy, the suffering, the bereaved, the old, it has brought supernatural comforts valued by millions of souls as more precious than any natural aid. It has helped parents and teachers to discipline the young. It has conferred meaning and dignity upon the lowliest existence, and through its sacraments has made for stability by transforming human convenants into solemn relationships with God. It has kept the poor (said Napoleon) from murdering the rich. For since the natural inequality of men dooms many of us to poverty or defeat, some supernatural hope may be the sole alternative to despair. Destroy that hope, and class war is intensified. Heaven and utopia are buckets in a well: when one goes down the other goes up; when religion declines communism grows".

Chapter 15

Ethnicity

I. Introduction and Definitions

Ethnicity is an historical process that develops from society and culture. Often it is a complicated and emotional classification of people and their perspective of where they fit in the nation-state. The modern nation-state is based on citizenship; implying a degree of allegiance and exclusivity from other nations or people. However, within the nation-state there are those groups of people who may not belong to the politically dominant groups and hold distinct cultural and/or social differences. They are labeled "ethnic" groups and at times, “minorities," whose differences are often granted recognition in all aspects except political self-determination. At times these ethnic groups will aspire to become their own nation-state and then ethnicity produces the rise of conflicts or wars aimed at self-determination or liberation.

As Manning Nash writes (*The Cauldron of Ethnicity in the Modern World),* “Ethnicity... is clearly related to politics, to class, to economics, and to culture and ethos.” He goes on to say that ethnicity has a deep personal component either as an embattled minority or as a member of a majority struggling to maintain control. All too often the post-modernist writers try to cram every conflict into a convenient category of race, class, or gender. While related to those factors ethnicity goes well beyond them to the core identity of individuals. While many observers of the Middle East tied the bloody civil conflict in Lebanon to class and political struggle, the crux of the conflict was the powerful catalyst of ethnic (religiously based) hatreds exacerbated by economic and political power disparity.

Ethnicity Defined

Most individuals would define ethnicity based on race, skin color, language, or nationality. This outward manifestation, however, is only a first step in defining ethnic differences. One must examine beyond the surface of an individual or group and recognize that perception defines their ethnicity. This perception is based on primordial ties--ties that initially define who a person is, what he is like, and how others are different. Thus, we can define ethnicity as "a self-perceived group of people who hold in common a set of traditions not shared by others."

These traditions may be based on language, religion, history, or other ties considered the 'building blocks' of ethnicity. These building blocks remain unchanged over time and are not subject to politics or economics:

o Body - biological components relating to blood, genes, flesh. This relates more to racial divisions.

o Language - communication that contains meanings and elements unique from other languages. An example here would be the division between French Canadians and the rest of Canada.

o Shared history - struggles, fate, a common purpose. An implication that personal and group fate are one in the same. This would apply most emphatically to the Arab feeling of unity

beyond religion, or nation, buttressed by a common (more or less) language.

o Religion - beliefs and practices that relate a group to some religious group different from the majority. There are many examples of this of which the southern Sudanese, Muslims of Mindanao, Christians of East Timor, the Copts of Egypt are but a few examples
.

o Nationality - a desire for the symbolic and, at times, political means of an independent people. Traditionally this has defined Americans although some would now question this in light of the daily bombardment of divisive points of view, and the highly politicized environment of hyphenated America in which we live. It is ironic that as we urge other nations to grow beyond Tribalism, we seem to be reverting to it. John LeCarre in his book *Our Game* has a character saying "While we are pulling down economic borders these ethnic crazies are putting up national borders."

Using these building blocks, an ethnic group develops a perception of themselves and where they fit in the nation-state. If the nation-state is a pluralistic society, pecking orders based on politics, race, region, religion, or language may develop. A combination of these pecking orders has produced some great empires--Greek, Roman, Chinese, and British, as examples. Those groups who did not assimilate and/or retained visible manifestations of their ethnicity, maintained a perception that they were distinct from the dominant group, an example being the Jews of Palestine.

Ethnic distinctions may be determined by eight referents: physical characteristics, name, nationality or national origin, language, religion, tribal affiliation, history, and cultural aspects such as clothes, eating habits, houses, and so on. Any of these components may be changed and a new ethnicity assumed. Individuals may adapt to changes quickly but group changes require more time, usually more than one generation if a different ethnicity is to take hold.

Individuals may display their ethnicity with varying degrees so that their ethnicity becomes latent, minimized or active. Different situations may require different displays of ethnicity depending on geographical location, emphasis by a political leader, or perhaps arrival of immigrants. In other words, depending on the context, individuals may choose to play down or play up their ethnic identity. They may even go so far as to challenge their national identity, regardless of the context. A Breton will probably declare himself a Breton first and a Frenchman second, whereas a Parisian will remain first and foremost, a Frenchman. Ethnic identity may not be static either. For instance an Egyptian may identify himself as an Egyptian one day and an Arab the next. It largely depends upon the context of the situation and with whom he may be speaking.

Why doesn't the Breton call himself a Frenchman or the Parisian call himself a European? Modernization appears to have pushed in the opposite direction of sociologists' predictions of a united, technologically bound universe. Instead of merging, societies search for smaller, more intimate ties against the alienation that modernization produces. Ethnicity then serves as a counterweight to that alienation. This is a particularly important concept to remember as we preach the "global village." While the European Economic union seems to be pulling Europe together, one only need to observe the world soccer competition to understand that the

nativist pull is far more powerful-at least in a certain time frame - than any economic cooperation.

As individuals seek these smaller ties, they may lean toward stratification and segregation. Stratification deals with access to political, economic, or social privileges. Segregation deals with physical separation of people. In stratification, individuals hope to break the barriers that curtail their economic benefits (such as unemployment), their political influence (lack of legitimate representation), or their social acceptance (an unfavorable background). In segregation, individuals may be subject to microsegregation (separate facilities), mesosegregation (ghettos), or macrosegregation (confinement to reserves or homelands). In analyzing these forms of segregation and stratification, the analyst needs to determine whether they are intentional or unintentional, formal or informal, or even official policy. The currents presently (2000) moving through the American Black community are examples of this dichotomy. One group seeks the more traditional goal of integration into the overall tapestry of American life, while a more recently organized group seeks to reinstitute segregation, in terms of university living arrangements, black colleges, unions, churches etc.

Today, some form of conflict is normal in a pluralistic society. One cannot examine the politically successful groups of a country without analyzing their influence over conflict. The political elite can no longer ignore those who may have been absorbed politically since minor groups may be the next majority. Thus, we might assume that the more ethnic groups that are visible in a country, the greater the chance for conflict. This conflict may occur in various political, economic, or social spheres and at various intensities. In order to minimize the potential for ethnic conflict, political elite's may employ several methods--

o An ideological commitment to minimize ethnicity, as we used to do in the United States, until recently when, as stated above, the renewed emphasis on ethnicity by minorities has reintroduced a new sort of segregation desired by the minority in contradistinction to the earlier segregation imposed by the majority.

o A nonethnic basis for consensus, such as religion, meaning the same sect. Being Muslim or Christian is not enough. One must be the "right kind" of Muslim or Christian. (Shia-sunni split in Lebanon, the Catholic - Protestant conflict in Ireland, the Orthodox - secular Jewish antagonism in Israel.)

o Creating a sense of belonging whereby the survival of the nation takes precedence over the individual or sectarian identity. The reluctance of French Canadians to go it alone must be based at least partially on the fear of being swallowed up economically and culturally by the United States.

Understanding ethnicity provides insight on the political, economic, and social structure of a foreign environment. Ethnicity will play a bigger role in the potential for conflict as countries become less homogenous. In a 1988 study by Walker Connor, of 168 surveyed countries, fewer than 25 percent were considered homogenous societies. The presence of ethnic groups vying for pieces of the political and economic pie can be a decisive element for examining the success of the political elite. The military analysts will probably find few areas of the world where ethnicity and the potential conflict it brings does not affect the power base of ruling elite's. The analyst is charged with understanding the extent of influence that a given

ethnic group may have and its potential to affect the political, economic, and social make-up of the region he studies.

The study of low intensity conflict (LIC), operations other than war (OOTW), counter insurgency (COIN), Small Wars, or whatever these political-military conflicts are called when you are reading this, must increasingly entail a greater understanding of ethnic warfare. Much of our Vietnam strategy in dealing with insurgency- what little there was- was focused on revolutionary warfare. This requires a much different strategy than ethnic warfare. For instance revolutionary warfare emphasizes the importance of wealth distribution, better government, land ownership, civic action etc. While all of these have a place in ethnic warfare, all the civic action in the world, or most efficient government, will not solve the problem of Palestine. There is little doubt that the Arabs of the West Bank are better off economically, socially, and in terms of personal freedom, than most Arabs in the surrounding Arab nations, but this has in no way diminished their ultimate desire to obtain independence from Israeli rule. So it is in Yugoslavia, the former Soviet Union, Sudan, Cyprus, the Kurdish regions and a myriad of other places in the world.

II. Interrelationships With Other Political-Military Factors

Since ethnicity is based upon religion, or language, or history, or culture and is often maintained or exacerbated by environmental, political, ideological, or economic factors, these must be analyzed in conjunction with ethnicity. For instance socio-economic factors are very important in assessing the volatility of an ethnic environment. When examining an ethnic group within a nation, generally analysts see socio-economic vertical stratification of a sect or ethnic group as a stabilizing factor while horizontal status as a destabilizer. For instance when an ethnic community is represented at all levels of the socio-economic ladder, there is little likelihood of violent conflict but when one socio-economic group occupies the lower end of the socio-economic spectrum, the potential for violence is high. This was the case with the Shia in Lebanon. Looked down upon by both Christian and Sunni Muslim communities, and virtually powerless at the national level, a rapidly growing Shia community swarming into the cities were ripe for rebellion. "Justice comes from the barrel of the gun." This became their slogan - borrowed from the Palestinians in their 1970's war against the Israelis (who had borrowed it from Mao).

The existence of the growing ethnic problem in every area of the world has particular interest for the political-military officer such as the SOF officer. The depth and detail of knowledge will be a much greater requirement in an ethnic conflict. For instance launching a PSYOP campaign, or a civic action project based on an assumption that the Kurds are a monolithic group with common aspirations will be a fatal mistake. And so it is throughout most of the world. Ethnicity is particularly important in the composition of the military. For instance in the United States the Army is composed of almost one-third Black or Hispanic soldiers (as of June 1998). Almost half of the total force originates from the South. Does this have an impact on our goal of an apolitical force? The Lebanese army splintered into three separate factions at the beginning of the civil war in 1976, supporting their confessional factions rather than the nation. The non-Arab or Shia soldiers of Saddam Hussein's army had little stomach for the war in the Gulf. The bottom line is this. Most nations in the world are multi-

ethnic and ethnicity as a force has put stress on the nation state as a viable concept. Can a nation survive and prosper in an environment of divided loyalties, segregated communities, and barely - concealed mutual antagonisms?

III. Questions To Be Considered

1. Define ethnicity. Identify the various ethnic groups in the nation under study. How strong are their loyalties to the central government? What is the central government's attitude toward minorities?

2. Is ethnicity a danger to nation state and why? If not why? Could it be exploited?

3. What is the ethnic composition of the military? The officer corps? The soldiers? What is the distribution of ethnic groups throughout the various arms and branches?

4. Does the socio-economic structure break down along ethnic lines? How? Any potential for conflict?

5. Do the ethnic minorities have a neighboring nation of the same minority with an irredentist history?

6. How unified, in terms of culture, language, religion, etc., are the minorities? Are they concentrated in certain geographical areas? Are they dominant in certain occupations? Are these occupations critical to the functioning of the country?

7. In philosophical terms can the nation under study integrate ethnic minority issues within a majoritarian democracy? Will there be some power sharing by the minority?

8. In terms of psychological operations themes, how general can these themes be, i.e., is there one-size fits all appeal or must the appeals be pencil thin in focus? In other words does the national populace respond to the same stimulus or symbols?

9. Does your own ethnic background predispose you to an affinity to one side or the other? Is there a tendency to assign devils and saints to opposing sides in an ethnic conflict, particularly among the media?

Chapter 16

Technology and Political Military Analysis

I. Introduction

This section on technology is a new addition to the POL MIL Handbook so several parts are still in draft and some issues remain to be explored. This will happen, in part, by developing questions and observations about technology during the long seminars and in the Media Technology course. The first question to be addressed here is why this Handbook should include a "new" section on technology? In other words, what is new about technology that makes it important in political military analysis?

II. The Definition of Technology

To begin with, we need to remember that technology means the application of knowledge to create solutions. This means that we need to think of technology as a concept rather than as a specific invention like a CD player or a computer or a hammer (and sickle). How we use such tools to solve problems is what matters here and this is where Twenty First Century technologies differ significantly from the tools of the previous centuries. In the past, technology has referred generally to the devices and machines that multiply the strength and abilities of men to make and move things. Whether we consider personal automobiles and power tools or giant cranes and planes, these devices generally serve as manpower multipliers. They are also designed and operated in terms of Newtonian Mechanics characterized by linear cause and effect relationships such as the watch works described in the introduction to this Handbook. With such technology, accuracy depends on precise parts working in unison and transaction speeds are constrained by the force of gravity.

By contrast, Twenty First Century technologies achieve precision through micro-circuitry operating at light speed. Former General Perry Smith describes it in terms of his digital watch:

> I wear a digital watch that tells time in various formats and has three alarms, a stopwatch, and the storage capacity for twenty telephone numbers. For a time I had a faulty watchband and I dropped the watch on the ground at least ten times while I was jogging, yet the watch has never broken. I have had to replace the battery only twice in five years. This watch is certainly much more complex than the old wind-up watch that told time but did nothing else. In comparative terms, the watch I wear today is the least expensive watch I have ever had, and yet it is the first watch I have owned that has never had to be fixed or cleaned. It is a much more sophisticated watch but it's also much, much more reliable" (Smith, p. 146)

Precision, reliability and uncertainty are key aspects of the new technology.

Characteristics of Twenty First Century Technology

In general, there are four distinct aspects of new technologies that we need to understand in order to use the concept of technology as a productive frame of reference for political military analysis. These include the shift from analog to digital systems, the multi user functionality of space based platforms, the speed and volume of digitized transactions, and their non-linear complex nature.

The shift from analog to digital systems can be "seen" quite literally by comparing the faces of the two watches described above. The digital watch represents the compression of data about the physical world into "bits" at the smallest atomic level which is then stored, combined and reconfigured on microchips at light speed. As, explained in user-friendly detail by Nicholas Negroponte in **Being Digital**, this process involves reconfiguring information about the physical world into digitized grids that are then encoded and decoded through digitized computations. The effect is "virtual" reproduction of physical phenomena through information processing.

A second significant aspect of this technology relates to the fact that such information processing systems, or devices, can be interlinked by transmitting light signals across space. This allows for the expansion of digitized processing through the non wired, as well as hard wired channels and facilitates information sharing and programming. The unique new aspect here is the increasingly large set of earth orbital transmission and relay satellites servicing businesses, government, militaries, and private users alike. As a result, both information products and services have become readily available to commercial users around the world so long as they have the decoding devices (i.e. cell phones, modems, computer terminals, etc.). The effect of this technology on cultures, finance markets, militaries, polities and ecological environments cannot be understated and is described as "globalization" by Thomas Friedman in his book **The Lexus and the Olive Tree**. This process has created a globally linked system in which digital computation devices constitute the infrastructure and space based platforms constitute the superstructure of the Twenty First Century.

A third aspect of new technology has already been mentioned above and will be developed during the program. This refers to the compression and transmission of data at light speeds based on the use of silicon chips. This not only allows for global "real time" communication but also for the development of technology designed to address aspects of human behavior never before understood. This includes the kind of biogenetic research that relates to cloning, human performance enhancement, disease immortality (cancer and AIDS), and artificial life. This has led not only to medical breakthroughs but also to a shift from user-based interfaces to agent-based interfaces with computers. In other words, Twentieth Century computers are built around button pushing and power point paradigms, whereas twenty-first century computers and devices will be built around the use of voice and face recognition and sensory signaling.

More important, both from a research and national security standpoint, this aspect of new technology introduces an era in which digitized information can be designed to

permutate and self replicate. This means that technology can "create" knowledge beyond computational solutions, facilitate artificial life and "invent" other technology. The related processes have important implications in all aspects of scientific research and have been shown applicable to phenomena as diverse as bee colonies and commodity prices. From a national security point of view, it ushers in the age of warfare through "smart" weapons and an array of new threats such as information viruses.

The fourth dimension of "newness" about this technology comes from the fact that research on the physics of light has generated important and paradoxical theories about how the world works. In a sense, these theories have asked: is light a particle or a wave? And the empirical answer is: yes. Traditional physics theories require that the answer be one or the other (either a wave or a particle) but "complexity" theories show that it can behave like both. In other words, we must accept paradoxical answers and uncertainties about physical relationships in order to create new technologies. This means we live in a world of multi-causality (and some times a-causality, i.e. no cause) where simple linear constructs fail to model human behavior effectively. Indeed, they may even lead to self- deception about how the world works.

Consequently, leaders in political military affairs, business, medicine, and all major professions have begun to change their views of the world according to new paradigms of action. This shows up in research on *national security* such as Thomas Czerwinski's Coping **with the Bounds, Speculations on Non linearity in Military Affairs**; on *leadership*, as in Margaret Wheatley's **Leadership and the New Science:** in *business*, as with Peter Senge's **The Fifth Discipline**, and in many emerging studies that will reshape the way we think and act.

In short, multi agent and multi causal models represent a needed paradigm shift in the analysis of political military affairs and International Relations.

Requirements of the New Paradigm

Where action on the ground is concerned, CA and PSYOP officers need to understand these concepts, because they have important doctrinal implications related to the expectations of policy makers regarding high tech solutions. This is especially important with regard to Operations Other Than War where the role of new technology in such operations emerges as a "qualitatively different problem from command and control in peace operations…" This requires new thinking in order to use the new technologies effectively. In other words, "…we are moving from a Newtonian and Cartesian paradigm of viewing the world as a clockwork universe, inherently mechanical, predictable, rational and reductionist, to viewing the world as flowing, adapting, nonlinear and holistic. (OOTW, p1) This view guides current and forthcoming military analysis such as the Strategic Assessment 2000 published by the National Defense University.

Based on this paradigm shift, "…new tools have been developed due to the increased synergy between the computer and our own minds, the ability to compute what

models, or descriptions of nature, we had conceived, but had, heretofore, only approximated." (OOTW, p2) Some of these new tools are described below, but the essential point here is that they are useful to the extent that they interface with users and doctrine that embody new operational concepts. This includes successful management on the ground of technology based on phenomena such as neural networks, cellular automata and genetic algorithms.

While we need not know the technical scientific definitions or theoretical aspects of these phenomena, the point here is that they refer to different ways of getting things done in the operational environment. In particular, they affect our views of "control" and uncertainty regarding political military outcomes. Ironically, the prospect of pinpoint precision and total networking of operational personnel can trigger an overload of information yielding an uncertainty over priorities, protocols and traditional command and control issues.

As the 1998 Marine Corps study on Maneuver Warfare concludes:

> Just a few years ago, we could not accept living with uncertainty on the battlefield. The prevailing view was that if we were able to collect and process enough information, with the right models and equations then we could prosecute war better. However, what [we know from] complexity theory … is that we cannot overcome or "control" uncertainty through the collection and processing of information. In fact, we may be fooling ourselves in thinking that we could have any control at all. (Hoffman and Horne, 1998, p7)

Thus, the technological challenge for the CA PSYOP officer is to develop a political military interface that accurately matches outcome expectations with appropriate technologies.

Technology and Operations Other Than War (OOTW)

The current technology revolution has introduced important new tools in many fields including medicine, telecommunications, microelectronics, and military operations. As a recent study by the National Defense University has noted "many technologies are being developed for many purposes, but these technical 'solutions' often appear out of step with operational priorites."35. Consequently, technology effectiveness depends heavily on "educating operators about what is available and feasible...[and to do so in a way that] bridges the present gaps between technology, policy and operations"(OOTW, p. 35)

For example, several generic technologies "appear to have wide application across representative OOTW" in just this manner. The data in Figure 1 juxtaposes generic technologies with possible missions. "In the military context, most of the technologies require integral C2, or are themselves a C2 application." (OOTW, pp. 39-41)

Figure 1. OOTW Missions and Generic Technologies

OOTW Technologies Missions	Information Disinformation	Information Sharing	Information Handling	Day/Night All Weather	Signatures	Training and Simulation	Sensors Platforms		Non-Lethal Weapons
Counter-Insurgency	+	+	+	+	+	+	+	+	+
Counter-Terror	+	+	+	+	+	+	+	+	+
Peace Enforcement	+	+	+	+	+	+	+	+	+
Peace Operations	+	+	+	+	+	+	+	+	+
Counter Drug	+	+	+	+	+	+	+	+	+
Civil Operations	+	+	+	+		+		+	+
Non-Combat Evacuation	+	+	+	+		+		+	+
Disaster Relief	+	+	+	+		+	+	+	+

Thus, C2 requirements, not just technical feasibility determine potential mission effectiveness. These same OOTW mission areas can be juxtaposed to technology applications that support each mission as shown in Figure 2 (below) to demonstrate "near-universal application across many mission areas." (OOTW, p. 41)

Figure 2. OOTW Missions and Technologies

OOTW Technologies Missions	Counter Insurgency	Counter-Terror	Peace Enforcement	Peace Operations	Counter Drug	Civil Operations	Non-Combat Evacuation	Disaster Relief
Demining	+	+	+	+				
PSYOPS	+	+	+	+	+	+	+	
Sniffers	+	+	+	+	+			+
Computers	+	+	+	+	+	+	+	+
Mechanical Disablers	+	+	+	+	+			
See Through Walls	+	+	+	+	+			
Acoustics	+	+	+	+	+			
PSYWAR	+	+			+			
Lasers	+	+	+	+	+			
Terrorist Atk Warning	+	+	+	+	+			
Radio Frequency	+	+	+	+	+	+	+	+
Counter Sniper/Mortar	+	+	+	+				
Body Armor	+	+	+	+	+			
AP/AM	+	+	+	+	+			
Anti Sam	+	+	+	+				
Auto Translation	+	+	+	+	+	+	+	+
Crowd Control	+	+	+	+		+	+	+
Location Recovery	+	+	+	+	+	+	+	+

Specific OOTW technologies currently under development include demining equipment, non-lethal weapons and several specific devices listed below:

Soldier 911, PRC-112/GPS Tracking and Warning system –
Preprogrammed border location and situational alert transmitting.

Livermore Labs
"Lifeguard" Anti Sniper IR System –Infrared sensing system to track sniper bullet trajectories and return fire automatically

-***People/Vehicle/Metal Sensors*** - For use in Border Patrol to distinguish people from metal background objects

Hovering UAVs – "local area satellites" that can be fitted with sensors to provide "near real time" data

MHD (Magneto Hydro Dynamics) - designed for actions such as "disabling equipment and stopping vehicles "with electromagnetic power impulses"

High Power, Low Frequency Sound Systems – Acoustic NLW that can cause intestinal distress and disorientation

High Intensity Lights/Laser Weapons – designed to "flash-blind" people and disrupt or disable optical and infrared targeting system

Stink Bombs – A negative olfactory experience

Micro Sensor Networks – Designed to create randomly scattered fields deployable from a wide range of delivery systems

Taken together, the research, development and fielding of such technologies introduces new issues in doctrine, training, and rules of engagement and new uncertainty in political military affairs.

Technology in Regional Theatres

High technology has transformed the way we do business in all key areas of life and this has penetrated every major region of the world. Just log on to the Internet for an example: http://www.arab.net/gid/welcome.html. This is the web site of the Jordanian state intelligence service. And consider the political demand of a Chinese politician in a "dirt poor" northern Chinese village: "We need more trees, also fiber-optic cable so everyone can have a telephone." (Friedman, p. 60) Fiber optics in rural China where schoolhouses have dirt floors? What does this tell us?

In short, any given region of the world will exhibit a mix of technologies unique to that area so we need to analyze how high tech resources interface with low-tech environments.

So, what are the operational considerations? A hallmark of the new technology paradigm is the opportunity, indeed the necessity to approach the world as a mix of dynamic systems and to adapt to diverse environments with a mix of high and low tech solutions. This means that we must adopt "non linear [models] and methods that will help better represent the real world." We need new questions that generate field applicability of political military analysis.

As an observational exercise, for example, we can ask which technologies elites and masses in a given environment use to process and exchange information. How does this compare to the information technology we use? What can we expect counterparts to know and not know about us as a result? And, how can we exploit what the counterpart does not know about us?

From an operational standpoint, additional questions related to mixed technology environments can shed light on how to interpret various aspects of the political military environment. For example, can low tech environments characterized by manual labor and handicraft economies "modernize" rapidly to attain high payoff productivity? Why (or, why not)? What is the relationship between technology and prospects for sustained development? Along these same lines, what role does culture play in technological and economic development. Do cottage industries and traditional village cultures signify intellectual and political inferiority because of high tech poverty or, are all people essentially equal in capability given the same technology? We may find valuable results by simply asking how local people and their elites solve problems in terms of available technology.

Asking and answering these kinds of questions can help the political military officer use the sixteen factors of analysis a "heuristic" device to create a "crude picture of the whole" operational environment, with technology as a pivotal dimension. In this manner, the "inherently nonlinear nature of the military C2 system" and the dynamics of mixed technology environments can offer new tactical and strategic opportunities.

This means that observing how people communicate, conduct business and go about their daily lives can tell us not only about technology but also reveal behavioral "codes" by which people collectively confront challenges, cope with disaster, relate to authority and sustain their identities.

III. Conclusion

As a new addition to the pol mil framework, this discussion of technology is still in draft so it remains for the reader to identify and research additional technology issues related to political military affairs. In particular, it is important to reckon with the multi-dimensional aspect of the technology concept because not all pol mil environments are high tech. Indeed, technology must be viewed in terms that go beyond just a simple spectrum of low to high tech assets that populate any given environment in order to arrive at an effective plan of action. We must therefore ask where each nation(s) of a target environment experiences advantages and disadvantages. And, in doing so, we will have another part of the puzzle that this book seeks to piece together. By assessing the technological dimension of the environment we can create more accurate explanations about how nations and their societies "form, function and fail." (Pentland, 1994)

Chapter 17

Media

I. Introduction

While we generally accept that the role of the mass media is a critical political-military factor, it is difficult to know precisely what the influence is. In analyzing the role of the media, one of the most pervasive questions may be the hardest to answer. What is the power, influence, and effects of various media? The short answer is: causal relationships are difficult to as certain because of the confounding effects of multiple variables.

Dutton defines media as a "critical *cultural institution* in which ideas and meanings are created and circulated within the society (Dutton, 10)." Mass media is a relative term; it refers to media that reach a large number of people.

Analyzing media can be approached from the standpoint of the basic elements of communications theory: sender, medium, message, and receiver. In looking at the media from these elements we will also highlight the tenets of the major theoretical perspectives. Be wary of theories that try to explain the media by focusing on only one aspect of the communication process.

II. Analyzing the Senders

A common question posed is: who "controls" the media? Who determines what messages to transmit? Is it the government, commercial sources, journalists, editors, the public (by what they will tune in to), or some combination of the above?

The propaganda and Marxist models focus on the senders and their messages. These theories focus on what *media does to people.* In these models, the media is an agent of social control, subservient to the dominant forces (elite) in the economic and political environment. Media is seen as a shaper of culture. In the words of Dutton, "The interests of the ruling group (be it a ruling class, patriarchy, etc.) are maintained through the media reproducing a dominant ideology, a set of beliefs and ideas which represent those interests as natural (Dutton, 5)." Ownership of the media is regarded as a key component in the domination of one class over another. From the Marxist perspective, the concentration of ownership and high entry costs prohibit contending viewpoints from being heard.

In the economic model, the mass media is viewed as industry. The mass media caters to market segments. The owners or senders seek to maximize audiences, rather than control or change audiences. In this model, what is produced is determined by demand. Profitability is the overarching goal. From this perspective, the prevailing views espoused in the media will be those in consonance or harmony with the prevailing cultural norms and values.

In the pluralist and free press models, no single sector of senders is omnipotent. There is a distribution of power in society; many competing interests have access to the media. While mass media tend to reinforce central values, the mass media also reflect culture. Changes in culture are reflected in changes in media. Even within sectors, no group is a monolith. For example, within government, there are differences between what the various actors have to say, The evidence of the utility of this model is indicated by the degree of diversity in a country's media.

In the functionalist model, the focus is on determining the roles and functions that media serve in a society. What role does the media play in socialization? Is the function of media entertainment, informational, ritual, or some combination (for example, "infotainment")?

In analyzing senders in a country, examine who owns mass media systems. But also realize that there may be a difference between who owns media and who finances media. For example, corporations own much of the media in the West, but media is primarily financed by advertisers (and indirectly, the audience). Also look at the role of conglomerates. Is ownership highly concentrated and what are the implications of this concentration? Who has access to media production?

How does the government influence media? Is there overt control by the government? Or does the government have an impact in other ways? How important is the government as a source of information? Even when the media is not explicitly controlled by the government, what role does the media play in disseminating government viewpoints? Is the news primarily generated by government press releases and news events or does investigative reporting play the major role? What influence does the government have in determining how issues are framed?

What is public policy, law, or regulation with regard to the media? Are there license fees, accreditation procedures, or legal restrictions on what can be propagated? Is there overt censorship? What happens to those who produce "illegal" media? Imprisonment? Are there subtle or indirect forms of censorship? Is there a government ministry of information (or culture) which has an impact on what is produced? For example:

> Every [Arab] government but Qatar has an information ministry whose Essential task is to mobilize the media - and through them, the public at large -in support of government policies. Information ministries monitor reporters' activities and whereabouts and help to shape (and sometimes wholly shape) the news agenda - both that which they produce for domestic consumption, and that which they allow to be broadcast overseas (Alterman, 1998, p.49).

How does the government control or influence media emanating from external sources? Are there restrictions on foreign ownership? Are there rules that favor certain producers? For example, in Saudi Arabia, in addition to overt rules, *al-Sharq al-Aswat (The Middle East)* is the only international newspaper that is printed in Saudi Arabia. This means it is the first international paper available each day. The paper is generally very supportive of the Saudi regime (Alterman, 1998).

Is the media in the country in transition from being state-dominated to a more pluralist model? And what are the implications? In states where media have been dominated by political propaganda, there are indications that people react differently to new media, particularly advertisements. This has been true in Russia, where the population is unforgiving of anything resembling propaganda or distortion (Davidson, 1992). Overall in Russia, advertisements have tended to remain heavily factual rather than persuasive (Mueller, 1996). Based on survey research of Russians after being exposed to Western TV commercials in 1990, a member of the J. Walter Thompson agency described the Russians as ambivalent about advertising:

> Emotionally, commercials are capable of evoking two opposing kinds of responses. On the one hand, they give a quality catharsis - an escape from daily hardship into fantasy and dreams. On the other hand they are capable of causing deep resentment and a wish to

> distance oneself because the imagery is too painful and absurdly removed from current reality. (As quoted in Davidson, 1992. p.48)

Brzezinski (1993) makes a similar point in his discussion of global communications and their effect on increasing awareness of inequalities.

What effect has technology had on the sender? Does technology make it more difficult for governments to control what people receive? Although some may predict that the Internet will reduce the ability of the state to control the flow of information; the opposite may be true. Those states with a propensity to try and control information will probably attempt to continue that propensity. Electronic searches may make it easier. It depends on encoding and routing. And the government may still have a gatekeeper function. For example, Bahrain, the UAE, and Saudi Arabia all have firewalls that control access into and out of the country (Alterman, 1998). While new mediums may hamper traditional censorship, the effect is not preordained.

III. Analyzing the Medium

Examine what media are commonly used. A good reference book, such as World *Radio & TV Handbook 1999, is* a useful starting point for radio and TV. Other reference books are available for other media. Also determine the relative importance and role of the various types of media. Is society oral, print-based, electronic or some combination depending on the sector? For most of the world, oral modes of communication continue to be an important means by which societal values are transmitted and acculturation takes place. Media can be classified into three broad categories:

a. Visual

- Newspapers
- Books
- Posters
- Internet (can also be audio-visual)
- Magazines
- Leaflets/pamphlets
- Direct Mail
- Billboards

b. Aural

- Telephone
- Radio
- Audio Recordings

c. Audio-visual

- TV (broadcast, cable, satellite)
- Internet
- Rallies/public speeches/conventions
- Schools (esp. compulsory public ed)
- Word of Mouth
- Audio-visual recordings
- Film
- Plays/live drama
- Church
- Loud speakers

Also examine what effect the medium has. Marshall McLuhan answers this question in the often quoted "the medium is the message," where is the focus is on technology and production.

What effect has technology had on mediums? According to Altschull the press in some countries "has been losing its character as an instrument of substantive information One result of technology is the constant news cycle. There is a premium on having something new. Those with the hottest news can capture audience and therefore advertising dollars. Previously, the news cycle was twice a day: the morning paper and the evening news. In the twice a day cycle there was more time for reflection, analysis, and confirmation. What role does live coverage have? We

see a compelling television image and we believe. But do images mask reality? The image may not be indicative of a greater reality.

And technology may not be the decisive factor. In the Iranian revolution, cassette tapes were critical in broadcasting the revolutionary message. Although there were more sophisticated technologies present, they were not readily accessible to the revolutionary movement.

Also determine if language poses a barrier to use of new technologies? For example, only a few search engines can search Arabic text (Alterman, 1998).

IV. Analyzing the Masses

In analyzing the media in a country, look at the form and content of the media products that are produced. What is mediated? Read the news available in the Foreign Broadcast Information Service (FBIS). Analyze advertisements. What symbols and themes are used by advertisers of products that are successful in a country? Even if you don't understand the language, watch film or TV. Try to answer the following questions:

- What are the dominant styles and formats found in the media?
- How are the visual arts used?
- How is music used?
- What symbols are used?
- What are the themes?
- Who is the messenger?
- Who are the opinion makers?
- What are the patterns?
- What is the regularity and how much repetition is used?
- How much variance is there?
- Do all of the major providers basically provide similar material in similar formats?
- What is the length?
- What is the role of sports in the media?
- What is the role of the news?
- What is considered newsworthy, and what is the content of the news?
- Who judges what is important?
- In prosperous and stable times, how interested are people in political news?
- Is news primarily information or entertainment?
- Is it analysis, commentary or opinion about the news?
- How prevalent are statements by public officials in the news?
- What is conspicuously absent from the media?

When analyzing the media in a country, look at a wide cross-section of media products. Doing so can provide a window into the culture.

V. Analyzing the Receivers

While the propaganda model focuses on the sender and the message, Elihu Katz poses the question in terms of what media does to people, but *what people do with the media.* Katz's basic argument is: the media must be analyzed within the context of social, cultural, and political institutions. The focus is on the reception and consumption of the message. In his 1977 book (co-authored with Wedell), *Broadcasting in the Third World: Promise and Performance*, Katz analyzes the introduction of broadcasting institutions into developing countries. Drawing on

original research in eleven countries, he concludes that there is a significant difference between expectations and actual effects across countries. The intended message may be very different than the audience's reading.

Katz's cross-cultural study *The Export of Meaning: Cross-Cultural Readings of Dallas* further indicates that viewers interpret according to their cultural prism. In other words, media that emanate from foreign sources interact with indigenous factors. The result in one country may be very different than in another. Do not assume you know what the effect will be. There are many factors which influence acceptance of a message, including the value system of the receiver, credibility given to the source, and repetition.

When assessing the impact of mass media on audiences, examine the characteristics of media that has a wide audience. From a purely behavioral standpoint, what are the patterns of reception? What is the dispersion/concentration of media and of audiences? Are there diverse products for a diverse audience?

What is the effect of technology on the receiver? As Alterman reports, "Only about 10 to 15 percent of all Arabs have regular access to satellite television, a smaller number reads the international Arabic press, and a smaller number still is proficient with the internet (p.3)." Although technology may provide access to new sources of information, to what degree do people use those sources? And what percent of the audience can afford access?

VI. Inter-relationships and Some Analytical Questions

Cultural Environment

- What role does media play in transmitting culture within the society?
- What role does media play in creating/sustaining a national identity?
- To what degree does the media serve as an agent of change?
- What is the form and content of prevalent media?
- What explicit meanings are in this content?
- What implicit meanings are in this content?
- To what degree does content reinforce the status quo?
- How are subcultures reflected in the media?
- Are new products or genres easily accepted, or are products that differ too much from the mainstream rejected?
- Does transnational media contribute to distorted perceptions about other cultures?
- To the extent that Western media has significantly penetrated the culture, how has it affected the culture?

History

- Do shared media experiences become history?
- Does the portrayal of history in mass media become the prevailing understanding of history?

Elites

- What differences are there in media consumption patterns of elites and others?
- What is the role of opinion leaders who interpret events?

Foreign Influence

- What is the degree of foreign media penetration?
- Is foreign ownership permitted; are there restrictions?
- What is the effect of transnational media?
- Does it highlight relative deprivation?

Political System

- What are the parameters of political debate within the media? (While debate may be acceptable, there may be area that are out of bounds and therefore not tolerated by governments or accepted by the general populace.)
- What is the degree of press freedom?
- What topics are taboo?
- Is it permissible to criticize the head of government?
- Is there an alignment between media and political parties or particular interest groups?
- How does access affect what is produced?
- Are those journalists who present issues in a light most favorable to the regime rewarded with better access to officials?
- How dominant is the state in the shaping of the media?

National Interests

- Has the country entered into any interstate agreements concerning the flow of media
- What effect has media had on the power and influence of non-state actors?

Political Economy

- Who owns mass media systems?
- Who finances media?
- What is the relationship between the state, the economy, and the media?
- What is the economic impact of the media?

Role of the Military

- How is military service portrayed in the media?
  For example, the perceptions created by the movie *Saving Private Ryan* are much different than the view of military service portrayed in Top Gun.

Religion

- What impact has the media had on traditional religious values?
  For example, Sinclair (1987) argues that the advertising prevalent in Western media has the cultural effect of legitimizing consumption and de-emphasizing religious dogma. Advertising appeals to desire, pleasure, and achieving satisfaction through consumption. The effect may serve to undermine some religious conditioning which focuses on rewards in an afterlife rather than earthly rewards. In a culture that constantly and pervasively emphasizes consumption,

individual gratification is no longer taboo. Brzezinski (1993) makes a similar point in his discussion of "permissive cornucopia".

VII. Summary

There is no single framework for analyzing and understanding the media. The relevance of different theological perspectives change by country. The role, importance, and functions of the media also change from society to society. You must examine media in the *context* of the other political-military factors. Economics, politics, culture, and the media are inextricably intertwined. Media can be an independent variable, acting as an agent of change, and media can also be the dependent variable, changing in response to other factors.

Foreword

The Role of Rhetorical Theory in Military Intelligence Analysis: A Soldier's Guide to Rhetorical Theory by Maj Gary H. Mills is another in an Air University Press series of substantive essays considered too short for publication as monographs but too lengthy to be journal articles. The purpose of *The Role of Rhetorical Theory in Military Intelligence Analysis* is to share Major Mills's rhetorical understanding with young officers attending initial intelligence training. Throughout he infuses key elements from the rhetorical discourse community into the discourse community that deals with training in military intelligence. Major Mills notes that his target audience is the military intelligence community. However, Air University Press is pleased to include this study as one of its Fairchild Papers because many aspects of *The Role of Rhetorical Theory in Military Intelligence Analysis* can enhance the rhetorical analysis of traditional university students and instructors.

About the Author

Maj Gary H. Mills, USAF, is currently serving as a senior analyst at Supreme Headquarters Allied Powers Europe. Prior to his current assignment, he was an assistant professor of English in the Department of English and Fine Arts at the United States Air Force Academy (USAFA), Colorado Springs, Colorado. Additionally, Major Mills was design director of *War, Literature and the Arts: An International Journal of the Humanities* and *Andre Dubus: Tributes* (Xavier Review Press, 2001). He holds a Master of Arts in technical and expository writing. Major Mills was commissioned through USAFA in 1990.

Preface

Nimitz's concept of intelligence was dynamic: Facts were high-grade ore to be sifted carefully, the pure metal of knowledge extracted and forged into a weapon to defeat the enemy.

—Gordon W. Prange
Miracle at Midway

I completed training for USAF intelligence-applications officers more than a dozen years ago. Since then I have used and adapted the USAF's practical discourse and analytical skills in a wide range of situations around the world. However, I never fully grasped the rhetorical framework behind these critical modes of communication until I was exposed to discourse theory at the University of Arkansas at Little Rock. As a result of my studies, I have learned how the rich backdrop of theory adds to the daily application of intelligence analysis.

Fortunately, as a result of my rhetorical education, I have a greater understanding of the critical theory behind each briefing, presentation, and mission-planning product. More importantly, theory focuses a penetrating analytical view on the power coursing through threat systems and hostile countries. Clearly, Air Force intelligence specialists will benefit from a detailed look at the ways an understanding of rhetorical theory enhances intelligence analysis. My purpose is to share my widened rhetorical understanding with young officers attending initial intelligence training. Throughout this study, I infuse key elements from the rhetorical discourse community into the discourse community that deals with training in military intelligence. As a result of this union, a powerful discourse paradigm shift places military intelligence specialists in a unique rhetorical position—one that will turn rhetorical theory into a powerful force multiplier.

My target audience is the military intelligence community; however, many aspects of this study can enhance the rhetorical analysis of traditional university students and instructors. The same targeted and tailored analytical approach used with threat systems applies equally well with almost any subject placed under the rhetorical "crosshairs." While adapting this

study to nonmilitary analysis, the reader should feel free to replace the intelligence cycle—discussed later—with processes specific to his or her discourse community. Additionally, the unit-level issues—addressed in the chapter titled "In the Trenches"—are applicable to a wide range of nonmilitary organizations and discourse groups.

Michel Foucault's rhetorical lens allows a detailed view of power and discontinuity in a widening range of situations and organizations. Rhetorical theory's application, in the enhancement of intelligence analysis, highlights its powerful, universal utility; with equally powerful utility, other rhetorical masters are also addressed. Readers should open themselves to the dynamic utility of rhetorical theory and remember that it is a power tool that continues to shape discourse and perceptions. For many, theory is an ephemeral element in the course of day-to-day activities; and in 1994, according to Ferdinand Saussure, "the very ones who use it daily are [often] ignorant of it." Fortunately, for those who can see and wield it, theory serves as a force enhancement and a catalyst for powerful paradigm shifts. In 1995 Walter J. Ong noted in his book *Orality and Literacy: The Technologizing of the Word* that rhetorical theory will continue to surround and shape our human identity. Through a strong rhetorical understanding, we bridge the gap between theory and application, resulting in the enhancement of our daily operations and analytical growth.

Acknowledgments

I thank the following professors for their outstanding support and guidance: Brig Gen (USAF, retired) Jack Shuttleworth, PhD, permanent professor and department head, Department of English and Fine Arts, USAFA, Colorado Springs, Colorado; Dr. Charles Anderson, Dr. Julia Ferganchick, Dr. Michael Kleine, Dr. Barry Maid, Dr. Roger Munger, and Dr. Richard Raymond, all from the Department of Rhetoric and Writing at the University of Arkansas at Little Rock. They excelled as academic authorities and, most importantly, professional mentors. I also recognize Naval Doctrine Publication 2, *Naval Intelligence,* which served as a key inspiration for my selection of some of the epigraphs for each chapter. Additionally, the Central Intelligence Agency's *A Compendium of Analytic Tradecraft Notes* bridged a daunting gap between theory and application, thus helping to open the way for rhetorical theory in the intelligence career field.

Abstract

As an unconventional analytical source, Michel Foucault contributes new power perspectives to intelligence analysis; and he gives a nontraditional look at a growing, evolving threat environment. As highlighted in *The Foucault Reader,* Foucault's analytical edge confronts these threats "by refusing to separate off knowledge from power." "His strategy has been to focus his work, both political and intellectual, on what he sees as the greatest threat—that strange, somewhat unlikely, mixing of the social science and social practices developed around subjectivity." Foucault's theories address the human behind the satellite images and database numbers: the result generates a powerful perspective on threat countries, systems, and situations.

His power influences resonate in every human system and organization. Specifically, he addresses the flow of power through organizational hierarchies. Through Foucault's rhetorical vision, one can look at an organization as a power being with a rhetorical circulatory structure supporting its existence. Power (discourse and knowledge) flows through the entire organization. Now, as a power-influenced (human-conceptualized) entity, organizations have spatial, temporal, and social compartmentalizations. These compartmentalizations require a physical means (conduits) of sharing information in order to allow power to flow. Additionally, Foucault addresses—in the 1982 book titled *The Archaeology of Knowledge and the Discourse on Language*—how the power shifts, ruptures, and discontinuities in the conduits can take on many forms when overlaid against the wide range of global norms. Most importantly, based on theory's powerful utility, the seeds of analysis must be planted as early as possible. Rhetorical theory is the key to enhanced analytical growth—an outgrowth that serves as a powerful military-intelligence force multiplier.

Chapter 1

Introduction

> *Knowledge is for me that which must function as a protection of individual existence and as a comprehension of the exterior world. I think that's it. Knowledge is a means of surviving by understanding.*
>
> —Michel Foucault

As intelligence specialists, the exterior world—more than 260 countries, geographic regions, and their associated political and military challenges—will test your ability to organize, process, and analyze vast amounts of information.[1] You have joined a skilled community responsible for the tireless analysis of potential and active threats against the United States. Fleet Adm Ernest King, USN, retired, effectively voiced the demanding requirements and standards for the modern intelligence specialist: "Institute rigorous, continuous examination of enemy capabilities and potentialities, thereby getting the utmost value of information of the enemy and enabling our forces to be used with the greatest effectiveness. It is particularly important to comprehend the enemy point of view in all aspects."[2]

Comprehension of the threat point of view requires a rhetorical vision that can be focused only through a fundamental understanding of how communication (verbal, textual, symbolic, and electronic) influences the intelligence cycle and, ultimately, joint combat operations.[3] Simply put, rhetorical theory (the exploration of communication and its impact, influence, and relationships in all forms) is in action all around us; it applies to every aspect of human existence. The role of theory in intelligence analysis is even more pronounced. Theory is a force multiplier; it is a natural, often overlooked, military enhancement.

An operationally tailored application of rhetorical theory can make the intelligence community—more importantly, your day-to-day work—even more effective. Typically, years of train-

ing and operational experience are needed to groom an outstanding analyst. Through a tailored instruction of rhetorical theory, new intelligence specialists just joining the career field can develop and mature at faster rates.

Well-worn steps and checklists are deeply ingrained in the military mind-set; however, the rich tapestry of rhetorical theory is unfortunately lost in the application of intelligence analysis at the level of a typical small unit. Dr. Charles Anderson, graduate-program director of the University of Arkansas at Little Rock's Department of Rhetoric and Writing, believes that we all know what to do come Monday morning, but theory helps us understand why. At unit level, theory takes a backseat to operations tempo, additional duties, and challenging requirements to meet a growing range of duties with fewer personnel. Typically, as a mission-oriented community, we tend to shun concepts and theories that do not appear to directly support the war fighters (soldiers, sailors, and airmen) in the completion of a broadening array of duties ranging from direct, conventional combat to peacekeeping operations. Theory is a powerful and integral part of current and future military conflicts. However, a look at a few unconventional rhetoricians is in order to focus the power of theory.

Sherman Kent, former Central Intelligence Agency (CIA) senior analyst and author, highlights the changing role of theory in intelligence analysis: "Intelligence today is not merely a profession, but like most professions it has taken on the aspects of a discipline: it has developed a recognized methodology; it has developed a vocabulary; it has developed a body of theory and doctrine; it has elaborate and refined techniques. It now has a large professional following. What it lacks is a literature. From my point of view, this is a matter of greatest importance. As long as this discipline lacks a literature, its method, its vocabulary, its body of doctrine, and even its fundamental theory run the risk of never reaching full maturity."[4]

Kent's call for a refined and tailored intelligence discourse makes the need for a solid comprehension of rhetorical theory even more critical. Additionally, he provides a superb example of rhetorical theory in action:

> The literature I have in mind will, among other things, be an elevated debate. For example, I see a Major "X" write an essay on the theory of indicators and print it and have it circulated. I see a Mr. "B" brood over this essay and write a review of it. I see a Commander "C" reading both the preceding documents and reviewing them both. I then see a revitalized discussion among the people of the indicator business. I hope that they now, more than ever before, discuss indicators within the terms of a common conceptual frame and in a common vocabulary. From the debate in the literature and from the oral discussion, I see another man [or woman] coming forward to produce an original synthesis of all that has gone before. His [her] summary findings will be a kind of intellectual platform upon which the new debate can start. His [her] platform will be a thing of orderly and functional construction and it will stand above the bushes and trees that once obscured the view. It will be solid enough to have much more built upon it and durable enough so that no one need get back in the bushes and earth to examine its foundations.[5]

Rhetorical theory can work exactly, and as easily, as Kent advertises in many settings with impressive results. Unfortunately, many analysts view this process as an administrative speed bump instead of an intellectual catalyst. Additionally, Kent's analytical foundation is only partially constructed if you fail to bring the right tools to the work site. With luck this guide will serve as a useful tool kit.

Application of targeted theory takes on many forms. For example, the CIA calls its process an "analytic tradecraft"—a process based on creative use of all source information and in-house best practices, in order to support "individual intelligence consumer's concerns."[6] Former deputy director for intelligence John Gannon—currently chairman of the National Intelligence Council—clearly recognizes both strengths and challenges of discourse. The growing "revolution in information technologies has improved our access to sources and our ability to quickly deliver intelligence."[7] Conversely, the rapid flow of information "has also made our [intelligence community's] work more challenging as we are bombarded with information of varying quality, relevance, and depth."[8]

All too often stereotyped and disregarded as pure academia, rhetorical theory is at the very core of military analytical development. Additionally, the same theory forms the basis of what many military intelligence specialists all too easily chalk up to mere experience. Through an operationally tailored analysis of Michel Foucault, this study will uncover a rhetorical framework

supporting the military analysis process: a rhetorical template designed to bridge the application gap between strict checklist discipline and power analysis, resulting in the highest quality of intelligence analysis.

Chapter 2

Let's Get Rhetorical

> *The DI (Directorate of Intelligence) will need greater interaction with outside experts to meet the broad and complex analytic challenges it faces. It must position itself to compete in a new information age in which consumers increasingly will have ready access to alternative sources of high-quality data and expertise.*
>
> —*Analysis: Strategic Plan*
> Central Intelligence Agency
> Directorate of Intelligence

As an integral part of the military's new information age, you need to be aware of alternative sources available to enhance your communication and analytical skills. Recently retitled as intelligence operators, intelligence personnel must apply every available tool in order to support worldwide warfighter operations. As highlighted by the CIA Directorate of Intelligence, your effective use of "outside experts will yield useful information and insight, along with constructive challenges to [your] working assumptions, that can only sharpen [your] analysis."[1] In this study, Foucault's discourse theories serve as the primary rhetorical workshop. As a result, there is a need to define the wide and essential scope of rhetorical theory, including a brief look at its history. The word *rhetoric* brings to mind many different meanings: "The practice of oratory [discourse or speech]; the study of strategies of effective oratory; the use of language, written or spoken [or electronic], to inform or persuade; the study of the persuasive effects of language; the study of the relation between language and knowledge; the classification and use of tropes and figures; and, of course, the use of empty promises and half-truths as a form of propaganda."[2] Intelligence officers interface with most of these overlapping meanings.[3] You even study many influences and forms of propaganda. However, most importantly, you must understand that "rhetoric is an action" and that it affects communication and analytical perspectives.[4] "In

one sense, rhetoric is an action human beings perform, and in a second sense, it is a perspective humans take. As an action, rhetoric involves humans' use of symbols for the purpose of communicating with one another. As a perspective humans take, rhetoric involves focusing on symbolic [and analytic] processes."[5] With some luck, this study will effectively communicate the strength of rhetoric's influence on intelligence—ultimately changing and shaping your perspective on analysis.

As service-trained communicators, you use written, spoken, and electronic discourse on a daily basis. Unfortunately, aside from military briefing style and training in audience awareness (for aircrews, command staffs, threat working groups, etc.), military technical schooling provides very little instruction in rhetorical theory. Your job is to organize, analyze, and share information; yet, ironically, you get very little training in the formal discipline critical to the core of your military profession—a fifth-century B.C. discipline that was initially established to settle conflicting property claims.[6]

"A revolution on Syracuse, a Greek colony on the island of Sicily, in about 465 B.C." brought about the end of a dictator's reign and ushered in a democratic system of government.[7] As a result of this change, Corax of Syracuse saw the need to equip citizens with skills to settle their property disputes since "they could not hire attorneys to speak on their behalf as we can today."[8] "Corax realized the need for systematic instruction in the art of speaking in the law courts and wrote a treatise called the 'Art of Rhetoric.' Although no copies of this work survive, we know from later writers that the notion of probability was central to his rhetorical system. He believed that a speaker must argue from general probabilities or establish probable conclusions when matters of fact cannot be established with absolute certainty."[9]

It is intriguing to consider that the standard "Probable Course of Action" portion of our crisis and situation briefings shares a formal genesis that extends as far back as Corax's *Art of Rhetoric*. Origins of this often elusive and mystic discipline are based on a very pragmatic and simple need to clarify and establish truth.

Development of rhetorical theory has changed dramatically over the years. "The historical development of rhetoric [is] divided into conventional chronological periods: the Classical (from the birth of rhetoric in ancient Greece to about 400 [A.D.]), the Medieval (to about 1400), the Renaissance (to the early seventeenth century), the Enlightenment (from the seventeenth to the end of the nineteenth century, a bit longer than in conventional usage), and the twentieth century."[10] Years can easily be spent studying each period of rhetorical development. This study includes these rhetorical divisions to underscore the fact that, much like the military, rhetorical theory is always changing and establishing new communication paradigms.

Intimately tied to origins of the formal art of rhetoric, the classical preparation of a speech or briefing—a principal medium used to share intelligence information—is particularly important. "Aristotle devoted a large portion of his *Rhetoric* to invention, or the finding of materials and modes of proof to use in presenting those materials to an audience."[11] Aristotle's canons (rules or laws) resulted in the first "pragmatic processes of presentation."[12] The rhetorical process of preparing a speech or briefing is divided into five stages: "(1) invention, search for persuasive ways to present information and formulate arguments; (2) arrangement, organization of the part of a speech to ensure that all means of persuasion are present and properly disposed; (3) style, use of correct, appropriate, and striking language throughout the speech; (4) memory, use of mnemonics and practice; and (5) delivery, presenting the speech with effective gestures and vocal modulation."[13] These five canons remain the cornerstone of the study of rhetorical organization, and key elements of this organization are in all effective intelligence briefings (fig. 1).[14] Additionally, it is important to note, under the arrangement stage, that "Aristotle says that all speeches have four parts: the introduction, the statement of the issue, the argument, and the conclusion."[15]

As an essential element in modern intelligence briefings, "classical emphasis on logos [logical appeals used to persuade during the invention step] is presented as if in recognition that human beings respond most strongly to rational appeals."[16] Aristotle codified two additional forms of persuasion: ethos (character and

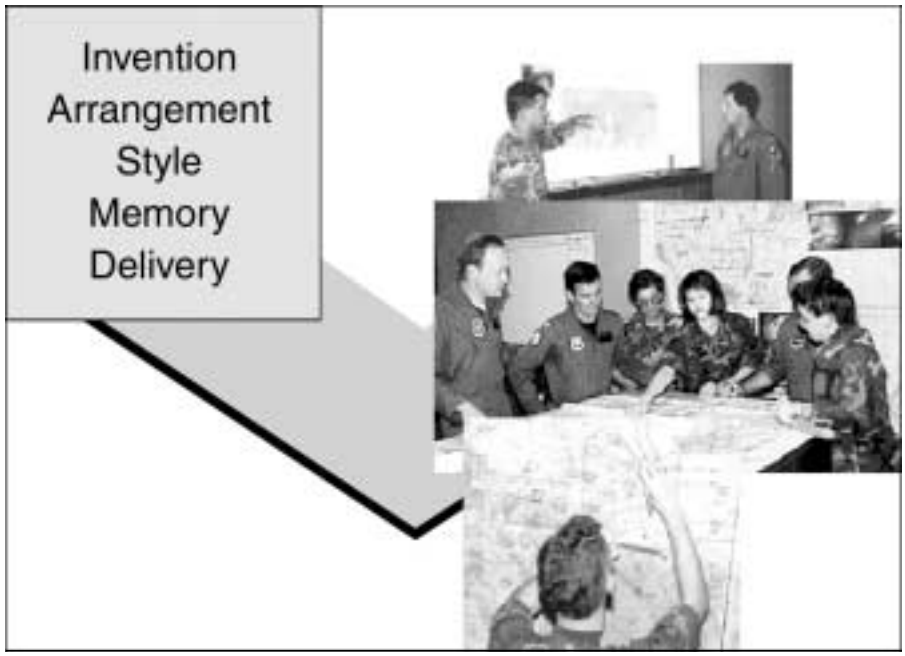

Figure 1. Military Briefing Origins

credibility) and pathos (the production of a certain attitude or emotion in the audience).[17] Obviously, you need to focus on logos and ethos—a logical analysis shored by credible sources (and a credible, ethical presenter) will serve you well. Methods you select to shape an audience's perception greatly influence your credibility. "As a rule, then, the consumer's confidence in the analyst's estimative judgment comes only after he or she has established credentials for expert command over all source information."[18] Importantly, you must respect pathos as a very powerful form of persuasion; however, please try to avoid emotional appeals—a sure way to crash and burn during a mission or current intelligence briefing.

Underlying the military's technical paradigm shifts, from linear formations to joint warfare and from muskets to precision weapons, exists an even more impressive rhetorical transition that continues to gather strength. Rhetorical theory is as alive today as it was during the days of its two key architects, Corax and Aristotle. Rhetorical theory is not as murky a

subject as some may have initially envisioned. You are already using, adapting, and improving on the rhetorical blueprints of the greats. "But there is more to say about the marriage of war [the profession of arms or military analysis] and knowledge."[19] Aristotle, a critical analytical cornerstone, raised an issue of analytical proficiency that should balance your growth as an analyst and officer.[20] He details the levels of knowledge required for true proficiency:

> Every systematic science, the humblest and the noblest alike, seems to admit of two distinct kinds of proficiency; one of which may be properly called scientific knowledge of the subject, while the other is a kind of educational acquaintance with it. For an educated man [or woman] should be able to form a fair offhand judgment as to the goodness or badness of the method used by a professor [or commander, allied or enemy] in his [or her] exposition [or leadership/tactics]. To be educated is in fact to be able to do this; and even the man [or woman] of universal education we deem to be such in virtue of his having this ability. It will, however, of course, be understood that we only ascribe universal education to one who in his [or her] own individual person is thus critical in all or nearly all branches of knowledge, and not to one who has a like ability merely in some special subject. For it is possible for a man [or woman] to have his [or her] competence in some one branch of knowledge without having it in all.[21]

You must avoid becoming strictly competent in only one branch of knowledge. Be "able to tell the difference between sense and nonsense, as we might say using modern terms, about the field [of intelligence]."[22] You must also be critical of a wide range of disciplines and be "able to distinguish between sense and nonsense even when [we are] not . . . specialist[s] in any one area of knowledge."[23]

Rhetorical theory is one of many disciplines at the heart of Aristotle's universal education—an education you will need in order to excel as an analyst.[24] Thanks to rhetorical theory, you can apply discourse-power theory to better understand how power flows influence real-world threat systems. Additionally, even without specific technical specialization, you can apply this rhetorical template to any system, resulting in a honed, critical perspective: a viewpoint filtered from the nonsense and focused on threat systems and potential crisis situations.[25]

Critical analysis is the trademark of the intelligence career field; however, it is impossible to accomplish without rhetorical theory. Interestingly, the topic of this project has been dis-

cussed with many of my friends in the intelligence community, and I have received a wide range of winces and head tilts in response to rhetorical theory. Ironically, rhetorical theory is at the root of my colleagues' most basic skills of organization and discourse: tasks they accomplish daily with little to no understanding of theory's rich history and framework. It is easy to live in theory denial; however, if you open yourself to an element of universal education, you will enhance the theory you are already using—and potentially take into combat.

Chapter 3

Intelligence Process

The success of any crisis deployment hinges on the existence of a reliable command and control system and of a flexible, reliable system for gathering, analyzing, and disseminating strategic and tactical intelligence.

—Gen H. Norman Schwarzkopf
United States Army
Operation Desert Storm, 1991

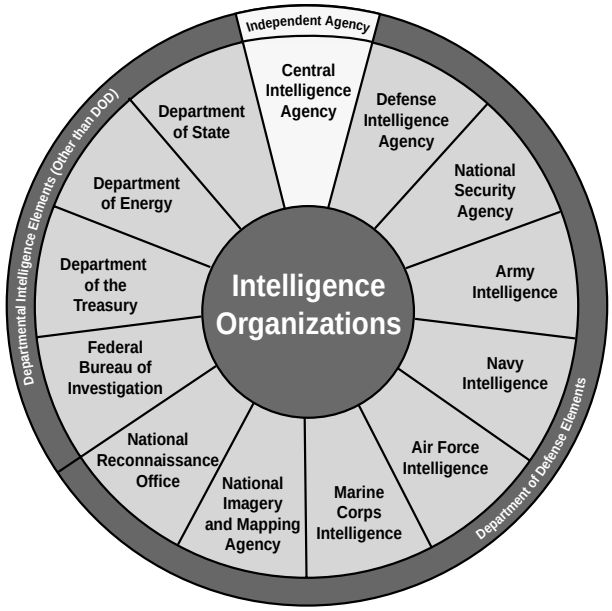
Before pressing forward with Foucault's rhetorical theories, I will review basic military intelligence pedagogy to highlight the key process that serves as a rhetorical road map. According to Joint Publication (JP) 2-01, *Joint Intelligence Support to Military Operations*, the intelligence cycle is the "process by which information is converted into intelligence and made available to users."[1]

As evidenced by the joint (Army, Navy, Air Force, and Marines) document on the subject, the cycle is well ingrained into each military service. It forms a fundamental bond among 13 national-level and service-level intelligence agencies (fig. 2).[2]

Planning and Direction Phase

The intelligence cycle begins with the planning and direction phase (fig. 3), in which commanders and intelligence analysts "identify and prioritize information requirements."[3] Key elements of information are identified, and a plan is then developed to satisfy as many user requirements as possible. "Early discovery of any requirements that cannot be satisfied through organic (internal to the unit or service), theater, or national intelligence collection resources will highlight potential intelligence gaps."[4]

Before continuing, I must highlight a critical distinction between information and intelligence: "Information is data that have been collected but not further developed through analysis, interpretation, or correlation with other data and intelligence. The application of analysis transforms information into intelligence."[5] A particular style or method of transforming information



Source: Central Intelligence Agency, *Agencies of the US Intelligence Community (USIC): 1998*, n.p., on-line, Internet, 10 June 1999, available from http://www.cia.gov/ichome.htm.

Figure 3. Intelligence Cycle

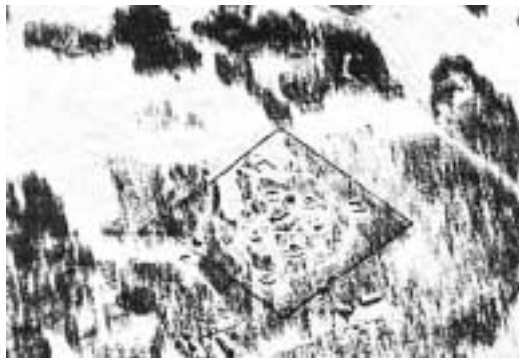
into intelligence is also at the core of rhetorical theory. You join the ranks of the great rhetoricians every time you take a piece of data, such as an image, troop positions, and so on, and process it through your experiences or knowledge of past or similar events. The widening range of information mediums presents additional rhetorical challenges to experience throughout the course of your career. Unfortunately, military events have proven that many of you will be "thrown into the mix" with a relatively limited experience base soon after graduation from intelligence school.

Collection Phase

Since 1960 the quality and quantity of artifacts made available to intelligence analysts have dramatically increased due to many technical advancements associated with the collection phase of the intelligence cycle. Collection of intelligence data has a firm, often infamous, footing in world history. Maj Gen Oleg Kalugin, the KGB's first chief directorate, now retired, highlights that "spying (politically toned as collecting) has been with the human race from time immemorial; it has often been called 'the second oldest profession' and was used by ruling elites as a major tool to protect their power from real or imaginary threats and rivals, both domestic and external."[6] General Kalugin intimately understands how "intelligence-gathering was transformed by satellites, lasers, computers, and other gadgetry capable of ferreting out secrets from every corner of the globe."[7] Specifically, an example of one of the most sophisticated collection organizations was publicly unveiled in 1992 with declassification of the National Reconnaissance Office (NRO).[8] NRO also revealed a revolution in data collection that began with the 1960 launch of the Corona reconnaissance satellite (photo below).[9]

National Reconnaissance Office Corona Satellite

Examples of the early artifact evolution include more than 800,000 Corona satellite images (one example is provided in the photograph below) that were declassified in 1995.[10] NRO "enable[s] U.S. global information superiority, during peace through war."[11] A quick look through NRO's archives clarifies the concerns of former CIA deputy director Gannon about the increasing flow of information. Obviously, since the launch of Corona, subsequent collection platforms have increased the number, type, and quality of intelligence artifacts.



Former Soviet SA-2 (surface-to-air) missile site, Corona, shown here in 1969.

In addition to spaceborne satellites, there are air-breathing (operating within Earth's atmosphere) collectors spanning from reconnaissance aircraft (photos shown on next page) all the way to original air-breathing collectors—humans. "Rulers and military leaders have always needed to know the strengths, weaknesses, and intentions of their enemies. Consequently, the trade of spying [intelligence collection and analysis] is as old as civilization itself. Around 500 B.C., ancient Chinese strategist Sun Tzu wrote about the importance of intelligence and espionage networks in his classic book *The Art of War*. The Bible [also] contains more than a hundred references to spies and intelligence-gathering."[12] Importantly, through collection and analysis, rhetorical theory has been there to put the key pieces together.

Left:* U-2. *Above:* The Predator unmanned aerial vehicle flies Navy reconnaissance close to the carrier USS *Carl Vinson.

Processing and Exploitation Phase

In addition to the collection of information, the processing and exploitation phase takes information and converts it into "forms suitable for analysis and production."[13] Processing information includes "translating foreign languages, developing film from tactical reconnaissance aircraft, generating hard (paper) or soft (electronic) images provided by electro-optical or infrared sensors, and converting raw electronic intelligence data into a standard message format suitable for automated handling."[14] Suitable analytical forms are often intimately tied to systems collecting the data, as evidenced by the Corona satellite images. The exploitation phase is a rich discourse mechanism for rhetorical research.

Production Phase

The production phase turns planned, collected, and processed information into "finished intelligence."[15] "Intelligence production is the integration, analysis, evaluation, and interpretation of information from all available sources into tailored, usable intelligence. A key principle in production is the fusion of information from various sources to form a complete and accurate product. Fusion is essential for an effective intelligence production

process that accurately reflects and supports the commander's prioritized essential elements of information (EEI)."[16] The human element is not only key to the transformation of information into intelligence but it also shapes your analytical techniques.

Additionally, the fusion from multiple sources demands an understanding of both operational and rhetorical benefits of each intelligence source (table 1).

Along with accelerated political and military events, advances in technology have accelerated the need for a heightened rhetorical understanding. Unfortunately, at the unit level (your primary training grounds), analysis is subtly pushed to the sideline in favor of information management. Technology provides a wide array of artifacts (imagery, electronic signals, databases, and so on), and inexperienced personnel often mistake these artifacts as analyzed intelligence. Rhetoricians

Russell S. Tomlin, L. Forrest, M. M. Pu, and M. Kim highlight the analytical implications of these artifacts: "This artifact, in essence, contains the meaning intended by the speaker [or the reporting-collection platform]. It is conducted to the listener [or analyst] in either spoken [or visual] or written form. The text [or image, data, etc.] is then unpacked and its meaning extracted from the text artifact by the listener [or analyst]."[17]

Within this process, analysts must extract meaning from data and images. The collecting system (camera, electronic spectrum receiver, and so on) may not accurately or adequately frame meaning or significance with the artifact. An analyst's difficult task is further complicated by the nature of the artifact. Without an associated, precise meaning, "the source, sometimes the only source [of information]," requires the analyst to engage "actively in constructing [his or] her own conceptual representation of the matters [or situation] at hand."[18]

Analysis is often confused as a product instead of a key (critical) rhetorical process. Conflict between artifact (product) and process will continue to complicate intelligence analysis. However, rhetorical theory is integral to the packing and unpacking of meaning behind modern artifacts.[19] Specifically, theory enhances the ability to visualize a battle space or situation when the artifacts fail to contribute to analytical "knowledge integration."[20] Rhetoricians have focused on challenges that thwart effective artifact analysis; the problem is twofold. The first hurdle deals with an analyst's ability to integrate information (knowledge integration) into a "coherent representation," resulting in construction of "concepts and events virtually identical" to the actual situation.[21] Deception and misinformation can significantly degrade your ability to develop a comprehensive understanding of a system or event. Equally debilitating, the second obstacle deals with management and control of the ever-increasing information flow (information management) in a "dynamic, real-time interaction."[22] Knowledge integration and information management continue to stress and stretch military analysts' capabilities. Unfortunately, the distinction between intelligence integration and information analysis is often blurred. "Knowledge integration (analysis) requires effective information management, but effective information management

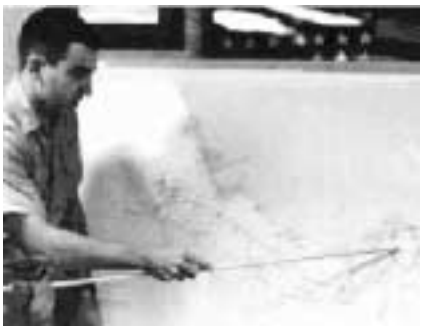
is not enough to account for knowledge integration."[23] With the growing number and diversity of artifacts, the intelligence community's focus on effective integration must remain paramount.

Dissemination and Integration Phase

During the dissemination and integration phase of the intelligence cycle, intelligence is provided directly to the user in a format that is "readily understood."[24] Answers to the commander's EEI are satisfied in a "timely manner without overloading the user and minimizing the load on communications capabilities."[25]

> Getting the product to the user is the last step in the intelligence cycle; but, because the cycle is dynamic, the process does not end with dissemination. First, intelligence personnel must ensure that the product is actually used. This is a particular obligation of intelligence personnel who are members of operational staffs. They are in the best position to demonstrate the value of intelligence products to commanders and other staff members. Second, intelligence personnel must see to it that dissemination is refined by gathering feedback from the commander or other users [aircrews] to ensure that intelligence requirements have been satisfied and the finished intelligence products are usable.[26]

Intelligence within this phase is "pushed" and "pulled" (as seen in photographs below) as analysis flows through intricate communication networks from command echelons down to individual flights, companies, and naval elements.[27]



Left to right: **Formal intelligence briefings "push" information to users, but tactical intelligence briefings "pull" it from them.**

The intelligence cycle is a proven tool to effectively fulfill many of the commander's objectives, as shown in the next photograph. An operationally focused instruction in rhetorical theory can

Aircraft scored a direct hit on a reinforced Iraqi aircraft shelter.

strengthen this process. Specifically, rhetorical theory can help ensure that analysis efforts and resources are tasked against threat pivot points. Seeds of analysis must be planted as early as possible through a focused interest in theory. Rhetorical theory is key to enhanced analytical growth. We will look to Michel Foucault, the master rhetorical gardener, for guidance before this author spreads more fertilizer.

Chapter 4

[What the] Foucault?

I think we should have the modesty to say to ourselves that, on the one hand, the time we live in is not the unique or fundamental or irruptive point in history where everything is completed and begun again. We must also have the modesty to say, on the other hand, that even without this solemnity—the time we live in is very interesting.

—Michel Foucault
Power/Knowledge: Selected Interviews and Other Writings

Paul-Michel Foucault—a prominent philosopher, historian, and rhetorician—was born in Poitiers, France, in 1926.[1] School was an exciting aspect of Foucault's life from a young age, and he excelled rapidly through the French school system.[2] While in his teens, Foucault experienced the toils of war as his town fell under control of German occupation forces during World War II.[3] "In his Jesuit school, Paul-Michel wasn't exactly a war hero [then again, he was only in his teens], but he did help other kids steal wood from the Nazis to heat the school."[4] During the German occupation, he experienced his "intellectual, sexual, and political coming of age" under an oppressive power shift that resulted in the "disappearance, flight and arrest of teachers, town's people, and relatives in the horizon of Nazi authority."[5]

Even after the rigors of a trying childhood, Foucault progressed intellectually and academically after the war. "Foucault went from school to school, doing extremely well on his exams, until he had reached the summit: he scored fourth among all the students in the country competing for entry to the Ecole Normale Supérieure in Paris—the most exclusive and intellectually intense college-level school in France."[6] His driven study of philosophy, psychology, and psychopathology fostered his drive to chart the "independent systems" that shape discourse and society.[7]

Foucault never served in the military; however, his firsthand occupation experience and painstaking study of history,

human behavior, and—most importantly—power, made him a social and intellectual tactician of the highest order. The breadth of his studies covers many expansive and elusive aspects of society.

> Foucault's early studies concerned the history of mental illness and society's response to it. Society's use of the concept of madness in the 17th century is the subject of his *Folie et Déraison: Histoire de la folie à l' âge classique* (1961; *Madness and Civilization).* In his book *Surveiller et punir: Naissance de la prison* (1975; *Discipline and Punish: The Birth of the Prison),* he examined the origins of the modern penal system. In these and other books, Foucault put forth the thesis that institutions such as asylums, hospitals, and prisons are society's devices for exclusion and that by surveying social attitudes in relation to these institutions, one can examine the development and uses of power.[8]

Foucault's other pivotal works include *The Order of Things: An Archaeology of Human Sciences* (1966), *The Archaeology of Knowledge* (1969), and *History of Sexuality* (three volumes, 1976–1984).[9]

His works are sometimes difficult to read, and he can test the mettle of even the best students of rhetorical theory. Furthermore, these books do not take up much shelf space in the military community's libraries. However, do not let this discourage you from seeking rhetorical sources to help you think and operate outside of the box. Foucault's work in this study is transplanted into the realm of military analysis, far from his original target audience. However, contemporary author and rhetorician Sonja K. Foss highlights the utility of Foucault's rhetorical theory: "In the area of rhetorical scholarship, Foucault's originality lies not in the introduction of totally new concepts for use in rhetorical theory but in how his notions may be used by others to stretch existing conceptualizations or may be applied to new domains."[10] Foucault would frown upon this "institutional" use of his power analysis. He once stated that "the goal of my work during the last twenty years has not been to analyze the phenomena [*sic*] of power, nor to elaborate the foundations of such an analysis. My objective, instead, has been to create a history of the different modes by which, in our culture, human beings are made subjects."[11] Fortunately, Foucault's analysis of the cultural modes and norms results in a striking power blueprint: a social projection that is bolstered by his refusal "to separate off knowledge from power."[12] Most importantly, even as a very reluctant,

unintentional military tactician, Foucault understood the critical, pivotal elements and practices of society: his most general aim was to "discover the point at which these practices [social, political, economic, legal, philosophical, and scientific traditions] became coherent reflective techniques with definite goals, the point at which a particular discourse emerged from these techniques and came to be seen as true, the point at which they are linked with the obligation of searching from the truth and telling the truth."[13] His detailed studies of mankind reveal critical discourse linkages—such connections are discussed in greater detail later in this paper.

Interestingly, he superbly catalyzes the domain of tactical analysis. Specifically, elements of his military applicability are highlighted during an interview conducted by Alessandro Fontana and Pasquale Pasquino. Foucault was asked the following question concerning the military model of power: "You have said about power as an object of research that one has to invert [Carl von] Clausewitz's formula so as to arrive at the idea that politics is the continuation of war by other means. Does the military model seem to you, on the basis of your most recent researches, to be the best one for describing power; is war here simply a metaphorical model, or is it the literal, regular, everyday mode of operation of power?"[14] Foucault frames his power response to the above question and generates even more compelling questions:

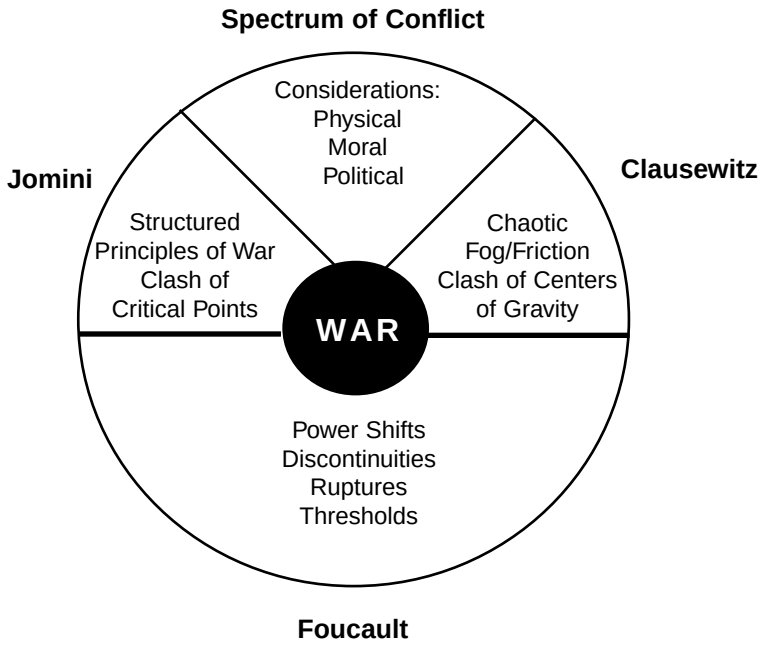
> As soon as one endeavors to detach power with its techniques and procedures from the form of law within which it has been theoretically confined up until now, one is driven to ask this basic question: Isn't power simply a form of warlike domination? Shouldn't one therefore conceive all problems of power in terms of relations of war? Isn't power a sort of generalized war which assumes at particular moments the forms of peace and the state? Peace would then be a form of war, and the state a means of waging it. A whole range of problems emerges here. Who wages war against whom? Is it between two classes, or more? Is it a war of all against all? What is the role of the army and military institutions in this civil society where permanent war is waged? What is the relevance of concepts of tactics and strategy for analyzing structures and political processes? What is the essence and mode of transformation of power relations? All these questions need to be explored. In any case it's astonishing to see how easily and self-evidently people talk of warlike relations of power or class struggle without ever making it clear whether some form of war is meant, and if so what form.[15]

Foucault's understanding of power relations serves as a primary analytical platform. More power specifics are discussed later.

Ever since you were young cadets or officer candidates, an understanding of Clausewitzian principles on the spectrum of conflict formed the basis of your understanding of combat. From structured, gentlemanly conflict under Gen Baron Antoine Henri de Jomini's warfare theory to chaotic conflicts described by Clausewitz, warfare is a historically prevalent element of human life.[16] Clausewitz's concepts of fog and friction were readily seen in the conflict in Kosovo. The fog (uncertainty) of combat is highlighted by smart weapons missing targets, US soldiers being captured, and stealth aircraft (F-117s) being inexplicably uncloaked (mangled debris) by Serbian television.[17] Similarly, the friction (countless minor complications) of supporting large combat formations with weapons, fuels, maintenance, personnel (aircrews and ground-support technicians), and accurate intelligence also complicates modern conflicts.[18]

At this point you may be asking, "What the Foucault?" Well, underpinning the entire spectrum of conflict is a complex, ever-shifting flow of power, ruptures, and discontinuity.[19] "One can never be absolutely positive that all enemy capabilities [power pivot points and decisive points] are associated with evaluating enemy intentions . . . intelligence preparation of the battlefield can reduce vulnerability to enemy actions by describing enemy courses of action so that they can be countered, forestalled, or exploited."[20] Power, as briefly discussed above, is often veiled: its absence is as poignant as its presence. As intelligence officers, your task is to chart the power plays on the political fronts and battlefields (fig. 4).

Foucault highlights many avenues for the analytical development of power. Conflicts share integral power relations resulting in valuable "concepts of tactics and strategy for analyzing structures and political processes."[21] Most importantly, Foucault asks, "What is the essence and mode of transformation of power relations?"[22] In order to help answer at least a portion of this critical question, I use Foucault's understanding of power flows and discontinuity. The effective preparation of the battle space for the prevention or prosecution of conflict



Source: Squadron Officer School, "4100-L-1," lecture, Class 97-D, Maxwell AFB, Ala., 1997.

Figure 4. Spectrum of Thought

begins with an understanding of these "warlike relations of power."[23]

All too often you focus on the physical platforms of the profession of arms (aircraft, computers, ships, tanks, etc.); however, it is the human element that allows the entire process to succeed. By the end of this discussion, I hope you have an appreciation of how rhetoricians such as Foucault can help you better understand the elusive human element of conflict—and the analysis of human struggles. As intelligence officers, you are also instructors, mentors, and subject-matter experts on a wide range of operational and tactical issues. Along these lines, you have an obligation to remain current in many forms of intellectual literacy. Marcus Cicero (106 to 43 B.C.), a famous Roman statesman, lawyer, and scholar, is remembered as one of history's greatest orators.[24] Cicero clearly highlighted his commitment to the arts: "No one should be numbered with the orators who is not accomplished in all those arts that befit the

well-bred; for though we do not actually parade these in our discourse, it is nonetheless made clear to demonstration whether we are strangers to them or have learned to know them."[25] You simply, much like your rhetorical forefathers, need to remain open-minded to the best available concepts in all fields. Unfortunately, discourse theory spends little time in the spotlight. However, as the primary communicators (orators as Cicero put it) of the military, you need to understand the underlying concepts of your trade.

Chapter 5

Power Plug

Here I believe one's point of reference should not be to the great model of language (langue) and signs, but to that of war and battle. The history which bears and determines us had the form of a war rather than that of a language: relations of power, not relations of meaning.

—Michel Foucault
Power/Knowledge: Selected Interviews and Other Writings

During spring 1999, I watched as 22 aircraft laden with airborne infantry and equipment from the 3d Battalion, 504th Parachute Infantry Regiment surged forward to form an impressive line of gray and camouflaged aircraft feeding onto the runway at Pope Air Force Base (AFB), North Carolina (see photos, next page). Each C-130 turned out of its parking location onto taxiways with near-drill-team precision. I reflected on the four previous 16-hour days involved in planning and preparation of the formation, including route analysis, many modifications, and then the scramble to provide each crew with mission-ready products. The mission was now under way. Concept and formation briefings were long since over. The final mission presentation, the joint mission briefing, was met with approving head nods and closing remarks from an Army brigadier general and an Air Force colonel. While standing at the edge of the legendary Green Ramp, the loading area for airborne troops and equipment, I was overwhelmed by the roar of 88 propellers cutting through the air. Although this was just an exercise, I could not help considering the physical and rhetorical ramifications of the event.

Later that evening, after all the aircraft were aloft, I returned to the mission-planning area to observe a second rhetorical event. An Army officer, one of the evaluators of the loading process, was honing his power-analysis skills and reading Robert Kaplan's *Balkan Ghosts: A Journey through History*. Considering the conflict in Kosovo, the officer's effort to explore a

Left: **C-130s parked on the ramp at Pope AFB, North Carolina.** ***Right:*** **Airborne troops getting ready to board.**

critical element of rhetorical analysis (history) was impressive—specifically, the officer's drive to bridge a daunting, expansive gap between a volatile region's history and the potential application of the power, like the force now airborne. Obviously, the two power events vary greatly in magnitude; yet, they share a common rhetorical thread—a tailored analysis of your own and the threat's power infrastructure.

Since you are intelligence specialists, understanding the power in both your and the adversary's capabilities and systems is extremely critical. Sun Tzu clearly understood the value of this critical examination of adversary and self: "So it is said that if you know others and know yourself, you will not be imperiled in a hundred battles; if you do not know others but know yourself, you win one and lose one; if you do not know others and do not know yourself, you will be imperiled in every single battle."[1] Knowing yourself and others, as Sun Tzu puts it, requires a detailed understanding of the physical (weapon systems, ranges, guidance types, etc.) and rhetorical (origin, history of use or misuse, supporting institutions, and infrastructure) power coursing through every aspect of intelligence analysis.

It is difficult to use power effectively unless it is studied and observed from an appropriate vantage point. For Foucault, the vantage point starts at the "panopticon."[2] Foucault adapts Jeremy Bentham's concept (physical plan) for the panopticon in order to give each power event its proper perspective.[3] "The panopticon consists of a large courtyard, with a tower in the center, surrounded by a series of buildings divided into levels

and cells. In each cell there are two windows: one brings in light and the other faces the tower, where large observatory windows allow for the surveillance of the cells. The cells become 'small theatres, in which each actor is alone, perfectly individualized and constantly visible.'"[4] Bentham's panopticon represents an actual architectural mechanism for observing and controlling a subject from a central position.[5] Although not exactingly adapted by Foucault, the panopticon is crucial to his power analysis.[6] Foucault uses the observation point in his search for power mechanisms and architectures. Figure 5 illustrates a potential hierarchical flow of power or discourse through two typical organizations. The pyramid on the left—shown in each of these panoptic illustrations—represents a sample US organization while the structure on the right represents a look at an adversary's power connections. The centrally placed observation tower, or panopticon, represents Foucault's power-observation position. The transparent cubes of the pyramid represent the panoptic cells with windows we

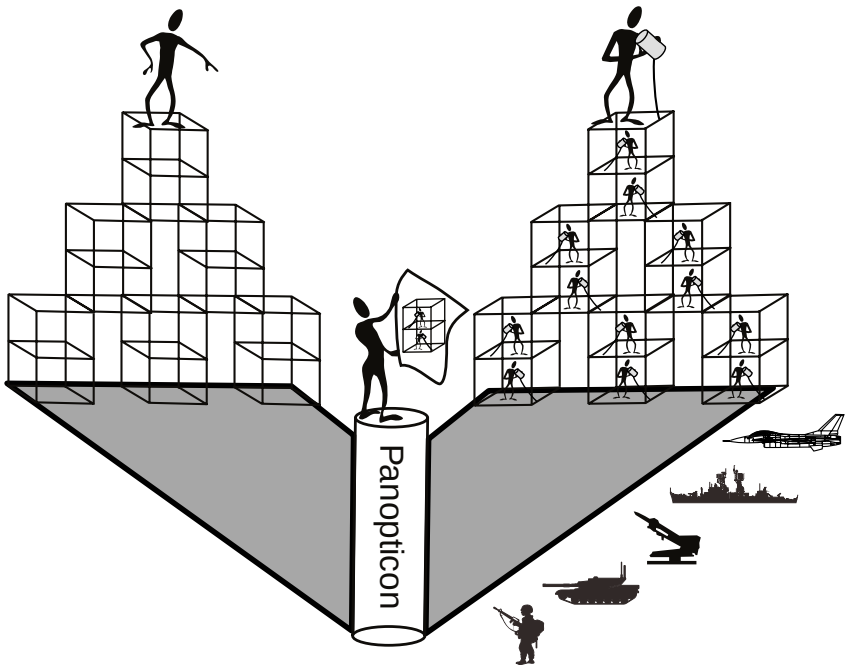

Figure 5. The Panopticon's Point of View

look through with the help of many intelligence sources.[7] Spread before the panopticons are Foucault's "institutions, economic and social processes, behavioral patterns, systems of norms, types of classification, [and] modes of characterization."[8] "The panopticon offers a particularly vivid instance of how political technologies of the body function. It is a 'generalizable model of functioning; a way of defining power relations in terms of the everyday life of men. . . . [I]t is the diagram of a mechanism of power reduced to its ideal form. . . . It is in fact a figure of political technology that may and must be detached from any specific use.'"[9]

Analysts can identify the same power infrastructures in everything ranging from an integrated air defense system to the training doctrine behind an individual soldier in the field. There are many operational panopticons in the military. Airborne command, control, and surveillance systems (see photos below) take their place as the high-tech, mobile observation points. These modern advancements embody many of the essential elements of Bentham's original concept. Military installations, field camps, and airborne formations depend heavily on the ability to observe and analyze a battle space or conflict. "Thus, through spatial ordering, the panopticon brings together power, control of the body, control of groups and knowledge."[10] The power analysis "perch" is well defined

Left: **The E-3 Sentry is an airborne warning and control system (AWACS) aircraft that provides all-weather surveillance, command, control, and communications needed by commanders of US and NATO air defense forces.** ***Right:*** **The E-8 joint surveillance, target attack radar system (JSTARS) is an airborne platform equipped with a long-range, air-to-ground surveillance system designed to locate, classify, and track ground targets in all weather conditions. Its capabilities make JSTARS effective for dealing with any contingency, whether actual or impending military aggression, international treaty verification, or border violation.**

and well organized; however, it too is subject to its own level of control. “As the final step in architectural and technological perfection, the panopticon includes a system of observing and controlling the controllers. Those who occupy the central position in the panopticon are themselves thoroughly enmeshed in a localization and ordering of their own behavior.”[11]

US military services, especially their service infrastructure, are built around many of the same “system[s] of observing and controlling the controllers.”[12] From controlling who has information access through panoptic background investigations to centralized control of access mediums—message traffic, encrypted Internet Web sites, and compartmented programs—intelligence agencies carry many of the same watermarks of Bentham’s original panopticon blueprint.

Importantly, the system of checks and controls adds to an organization’s “economy of power.”[13] “That is to say, procedures which allowed [and still allow] the effects of power to circulate in a manner at once continuous, uninterrupted, adapted, and ‘individualized’ throughout the entire social body.”[14] A clear understanding of an organization’s circulatory system will lead to the heart of its key strengths and weaknesses. Physical and social procedures surrounding the flow of power serve as key power conduits that you must take a look at through Foucault’s rhetorical lens.[15]

Foucault’s analysis techniques not only match the intelligence architecture but they also work as a “focusing lens” for the organization’s power flow. Additionally, Foucault’s analytical lens works equally well to magnify the often-hidden power conduits in an adversary’s structure. A detailed understanding of power conduits and the restrictions placed upon them is needed to apply Foucault’s analytical tools.

From the combatant commander down to the soldier in the field, a conceptually simple yet powerfully complex power architecture exists. Each power level in the architecture acts as a power plug in a “network of relationships that are systematically interconnected” in a series of standard and potential connections (fig. 6).[16] Our routine conduits constitute what is seen as standard operating procedures; furthermore, these connections end up in baseline field orders, air tasking orders,

and special instructions to energize US power architecture with discourse power. Intelligence officers can excel as "power boosters" and/or "surge protectors" in order to maintain an optimal balance in the flow of "juice."

> In this task of adjustment, discipline had to solve a number of problems for which the old economy of power was not sufficiently equipped. . . . It must neutralize the effects of counterpower that spring from them and which form a resistance to the power that wishes to dominate it: agitations, revolts, spontaneous organizations, coalitions—anything that may establish horizontal conjunctions. Hence the fact that the disciplines use procedures of partitioning and verticality; that they introduce, between the different elements at the same level, as solid separations as possible; that they define compact hierarchical networks; in short, that they oppose to the intrinsic, adverse force of multiplicity the technique of the continuous, individualizing pyramid.[17]

As you partition your view of yourselves and others, an objective view of critical-power choke, pooling, and stop points gains strength and clarity.

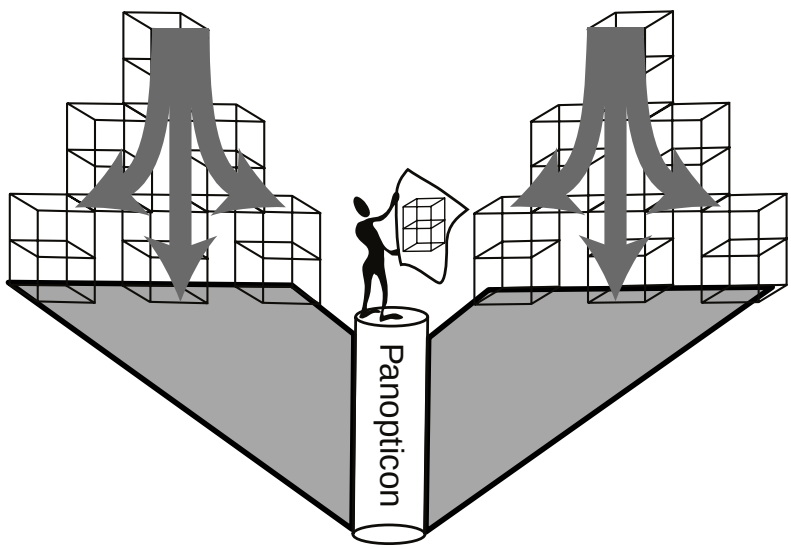

Figure 6. Power and Knowledge Flow

Power, pyramids, and vertical partitions were covered. Just in case you are wondering—no, you do not need to splice an electrical engineering degree with a course in Egyptology. Just keep in mind that observation and control of power depends on a complex group of relations—interactions that depend heavily on

communication.[18] For Foucault, "discourse is a form of social action" built on networks of archives, social practices, and institutions (fig. 7).[19] "[Foucault] demonstrates the microphysics of power that resides in the knowledge that is disseminated in discourse and embodied in laws, regulations, tests, and in the very architecture of hospitals, schools, and prisons, showing the ways that seemingly diverse discourses come together in formations that affect social practices and social controls."[20]

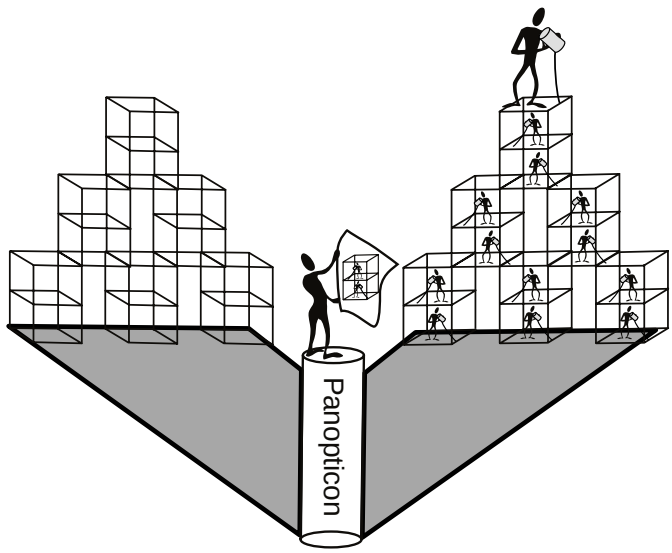

Figure 7. Discourse Hierarchies

If you can understand both your own and the adversary's discourse formation, you can better identify pivot points to reinforce, degrade, or attack. Appropriate action can be initiated if you can highlight the tactics of power that fulfill Foucault's three criteria for "the ordering [structuring] of human [power] multiplicities."[21] These social pivot points serve as critical elements in power analysis. Key discourse pivot points (fig. 8) and target areas will exercise power economically (a significant reduction of hierarchical effort, social resistance, and physical/monetary expense). They will take power to its maximum intensity and range; they will link power and economy through amplifying mediums (visual, electronic, tactile, etc.) and organizations (educational,

military, industrial, etc.) in order to add clarity and strength.[22] If you can understand these areas, you will fully realize your own capabilities. These points are also known as centers of gravity and decisive points. Additionally, these pivot points will help you comprehend the enemy point of view.

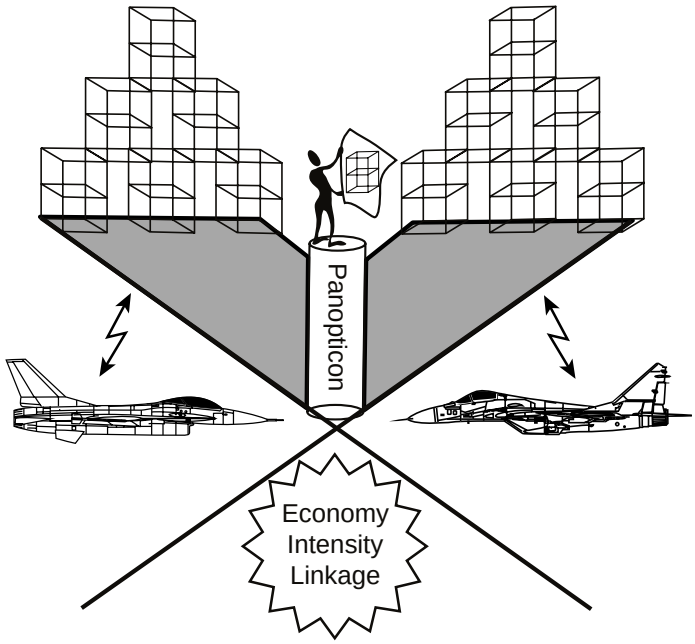

Figure 8. Discourse Tactical Considerations

The fighters in figure 8 represent just one element of a country's military capability. Additionally, they embody every aspect of Foucault's three criteria. For example, the aircraft on the left represents a US plane, and the one on the right represents a hostile force's air capability. The corresponding countries' power structures are directly responsible for employment of their aircraft. Power flow starts at the top of the discourse hierarchies and proceeds down a complex system of conduits (shaped by social and physical procedures, tactics, and strategies) with each aircraft representing the military manifestation of the power flow. Inside each aircraft, there are several additional sets of power conduits. Each aircraft's physical power (speed, range, weapons, etc.) and each pilot's capability repre-

sent another critical set of conduits. The aircraft's physical power is readily seen; however, the pilot's training (aircraft systems and procedures), threat knowledge (systems and tactics), and access to information via (a secure and reliable) connection to the main conduit (with the panoptic view of the battle space) are rarely acknowledged. Overall strength of an allied or hostile power flow is directly tied to the economy, intensity, and linkage of the flow.

Operation Allied Force (Kosovo conflict), the air campaign against Serbian forces, is an example of economy, intensity, and linkage in action. NATO successfully engaged Serbian military infrastructure through an effective use of its own economy, intensity, and linkage. According to *DOD News Briefing* (July 1999), NATO's economy was demonstrated through destruction of 110 Serbian tanks, 210 armored fighting vehicles, and 449 pieces of artillery and mortars, with loss of only two aircraft (pilots rescued unharmed) during 78 days of flight operations. The monetary economy or expense of the operation was considerable. However, the ultimate economy was realized through preservation of NATO and civilian lives throughout the operation. According to Secretary of Defense William S. Cohen, "of the 23,000 bombs and missiles used, only 20 went astray causing collateral damage."[23] Equally, intensity of the weapons employed by NATO aircraft was very evident, as highlighted by the number and variety of targets disabled or destroyed. Additionally, unrestricted range and employment of NATO aircraft highlight the intensity of their employment. Finally, linkage of the employment was underscored by use of multinational command and control systems, aircraft, and personnel in attainment of a common objective. The airpower portion represents only one component during one phase of the conflict in Kosovo. Operation Joint Guardian, the follow-on operation, involved employment of NATO peacekeeping forces (ground troops) in Kosovo.

During the Persian Gulf War, intelligence analysts effectively identified Iraqi pivot points as they determined critical targets against which coalition forces would apply physical power. According to the *Gulf War Air Power Survey*, vol. 1, *Planning and Command and Control,* experienced intelligence analysts were

able to chart the flow of power through the Iraqi military architecture.

> American intelligence recognized the highly centralized nature of the Iraqi military and political systems. And this leadership resided in the person of Saddam Hussein. The CIA, DIA, and State Department devoted a great deal of effort [to] examining him and concluded that he would remain in power for the foreseeable future despite the presence of numerous, ineffective, and demoralized opposition groups. . . . Saddam and the Ba'ath Party maintained their power through a pervasive, effective, and harsh intelligence and security apparatus that periodically infiltrated and decimated internal opposition groups. Thus, both CENTCOM [Central Command—responsible for the Iraqi area of operation] and CENTAF [Central Command Air Forces] staffs targeted leadership before the crisis erupted, but only the military portion of this foundation supported the Baghdad regime. The inclusion of additional political targets into air campaigning occurred only after the United States was committed to Operation Desert Shield.[24]

The Iraqi power structure's economy, intensity, and linkage were effectively identified.

Unfortunately, a misapplication or misunderstanding of our own pivot points can create unwanted entropy that can wreck an operation. Effective discourse fuses power and knowledge critical to any successful military operation.[25] Again, drawing from Operation Desert Storm, a delayed amplification of our own pivot points resulted in an initially poor rhetorical economy of power that was successfully overcome via our superior physical force.[26]

> As in past conflicts, intelligence enabled the planning for Desert Shield and Desert Storm—it did not formulate it. In the case of defensive planning for USCINCCENT [US combatant commander of Central Command] OPLAN [operations plan] 1002–90, intelligence analysts were caught in the post–Cold War transition from Soviet–European emphasis to smaller, but more numerous regional threats. As a result of the region's relatively low priority before Desert Storm, their information on Iraq was less than comprehensive and woefully out of date. Even when those analysts who were watching the Arabian Peninsula detected early signs that Baghdad might be preparing for military operations, they were unable at first to capture the attention of senior policy makers who, up until the summer of 1990, had been advised that Iraq had been exhausted by its war with Iran and would limit its bellicosity to the diplomatic arena.[27]

Fortunately, thanks to Foucault's power analysis, the ability to chart this power flow will help you to operate more effectively during any future conflict—at any echelon (from higher headquarters down to the unit level). Specifically, use of the

military's panopticons can help map the power conduits in each level of an organization—conduits shaped by the organization's social hierarchies, physical structures, procedures, tactics, and strategies. Additionally, an understanding of how Foucault's elements of economy, intensity, and linkage dramatically affect the flow of power or discourse through the conduit structure of any organization, system, or situation will prove helpful.

Obviously, our intelligence capabilities do not allow a complete, unhindered view of an adversary's discourse infrastructures. Moreover, we cannot address discourse mechanisms of real-world threat systems; doing so would move this discussion into a classified realm. Discourse and power flows can be encrypted, hidden, duplicated, and circumvented by many high- and very low-technology means. From satellite communications to hand signals, discourse power flows can branch, ebb, and pool in many ways. However, if you can understand how to isolate, block, or manipulate the discourse flow of any weapon system, you have effectively removed it as a threat. As more is learned about megatons, Mach numbers, cyclic fire rates, and ranges of a wide array of weapon systems, it is very important to consider the power plug for each system; it will undoubtedly highlight the most pivotal characteristics to avoid or exploit.

Chapter 6

Discontinuity Fever

The test of a first-rate intelligence is the ability to hold two opposed ideas in the mind at the same time, and still retain the ability to function.

—F. Scott Fitzgerald
The Crack-Up

Foucault raises a key question in reference to the flow of power and knowledge: "What is the essence and mode of transformation of power relations?"[1] This discussion has shown how the panopticon can help identify critical pivot points in the power relations of a given architecture. However, in order to fully evaluate power surges, you must examine the flow with a power analysis focused on complex shifts, ruptures, and discontinuities underlying the power structure (fig. 9).[2] The base-line requirement is to "differentiate the networks and levels to which they [power events] belong" and to use power analysis to "reconstitute [detect, characterize, and evaluate] the [discourse] line along which they are connected and engender one another."[3] Foucault clearly understands the strengths and difficult consequences of power analysis: "The notion of discontinuity is a paradoxical one: because it is both an instrument and an object of research; because it divides up the field of which it is the effect; because it enables the historian [tactician] to individualize different domains but can be established only by comparing those domains."[4] A "powerful and flexible grid of interpretation with which to approach relations of knowledge and power" forms the architecture of the organization.[5] You monitor "longer-range continuities in cultural [power] practices" that form Foucaultian norms in order to highlight trip-wire events.[6] Unfortunately, even norms expand and contract to set new and sometimes dangerous tensions on trip-wire power events.

Power shifts, ruptures, and discontinuities can take on many forms when overlaid against a wide range of norms across the globe. For example, the death in 1994 of North Korean leader Kim Il Sung created a relatively small ripple in the power flow

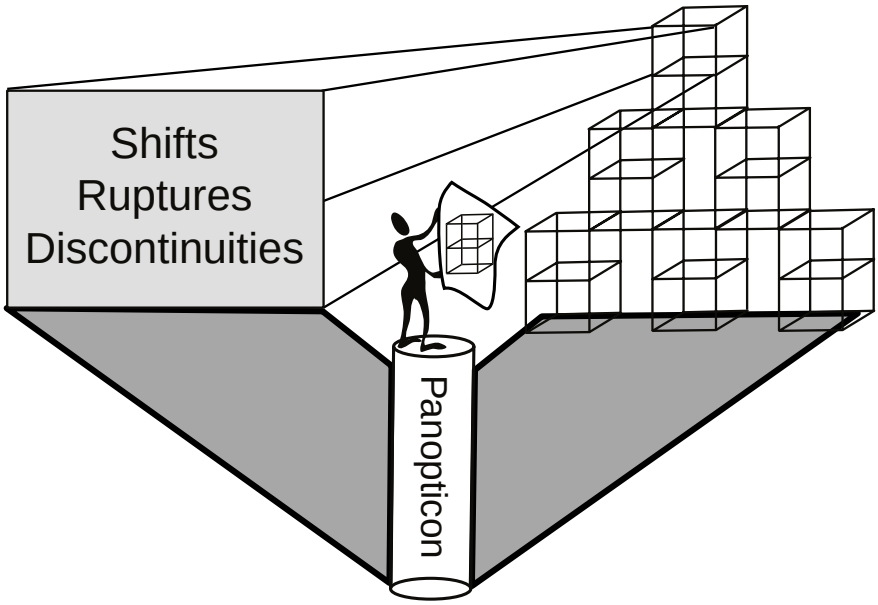

Figure 9. Power Analysis

when compared to deaths of other leaders in other regions. Conversely, the death of Marshal Tito (1892–1980)—anti-Nazi resistance hero from 1941 to 1945 who served as "godfather of all Yugoslavs" after the war—created not only a power shift but a power rupture (creation of new power nodes) with innumerable discontinuities.[7] There are many positive and negative aspects to these power mutations.[8] Obviously, Tito's cohesion of volatile Balkans came at a high price—specifically, his secret police and island prisons.[9] Power ruptures and discontinuities continue to surge throughout the former Yugoslavia—as witnessed in Bosnia and Kosovo (photo, next page). Also, Iraq experienced a dramatic power shift in 2003. The regime change there opened many ruptures and discontinuities as this once repressed country gradually moves toward democracy. Observe the new power nodes that are established, modified, and removed as Iraq is returned to the control of its people. Importantly, consider how these changes can be viewed and analyzed with the help of a rhetorical lens.

Refugees of the Conflict in Kosovo

Other countries (the former Soviet Union, Iran, Cuba, etc.) have faced significant bends in power flow over the years. David Brownstone and Irene Franck's *Timelines of War: A Chronology of Warfare from 100,000 BC to the Present* exhaustively lists recurring (some ongoing from their very origins) issues behind the world's conflicts. The need and the importance of effective intelligence analysis are in no danger of decreasing. James F. Dunnigan and Austin Bay comment on the analysis of global strife: "Wars don't just happen. Organized violence, like the weather, is never a complete surprise. There are signs and long-term trends. You cannot predict exactly what the weather will be at noon tomorrow. You can, however, analyze past and ongoing conflicts and use the results to project the major trends shaping similar current and future events."[10] Shifts, ruptures, and discontinuities (trip-wire events) often precede many signs and long-term trends. You must carefully examine a battle space and help determine a wide array of trip-wire events. Assets, ranging from local (organic) to national level, can be tasked through the intelligence cycle in order to observe these events.

Unfortunately, according to Enoch Powell, even with trip wires, conflicts will remain a permanent part of our history. "The various techniques through which power is enacted are acceptable to us only because most of the power is hidden. The effectiveness of power increases as its visibility decreases.

This disciplinary, normalizing power is far more subtle and pervasive than the easily identifiable, spectacular, repressible, and potentially violent types of power, so we acquiesce readily in ways we would not to more overt forms."[11] As a result of this hidden potential, trip wires can in no way be redirected from the power infrastructure into an isolated checklist. Uncertainties of knowledge (photo below) continue to exist even during our age of high technology.[12]

Uncertainties of Conflict: Crews Train in Chemical Warfare Ensembles

Directly tied to uncertainty is the possibility of deception. The CIA's *A Compendium of Analytic Tradecraft Notes* highlights several key warning signs associated with deception.[13] An understanding of a target country's capabilities, opportunities, and motives helps to scale "the likelihood that a country or organization is engaged in an attempt to distort the analyst's perceptions."[14] "Knowledge of which secrets an adversary most seeks to protect adds a distinctive perspective to the analysts' understanding of the country's military, political, and economic priorities."[15] Additional warning signs highlight the "anomalies in the information available to the analyst."[16] Suspicious gaps in collection, suspicious confirmations, and contradictions to carefully researched patterns represent discontinuities underscored as key warning signs (fig. 10).[17]

Suspicious gaps in collection are generated when "conclusions and judgments received through one collection channel are not supported to the extent expected from the take of other collection systems."[18] Although certain patterns of behavior are subject to rapid change, analysts "should examine criti-

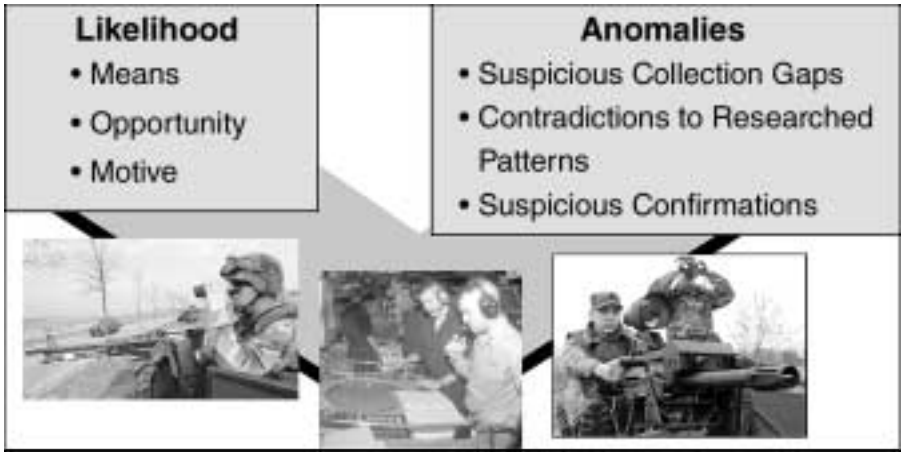

Figure 10. Influence of Deception Warning Signs on Analysis

cally information that signals an inexplicable change, for example, in an adversary's priorities and practices" resulting in contradictions to carefully researched patterns.[19] As a final warning sign to a deception operation, suspicious confirmations result "when a new stream of information from clandestine sources or technical collection seems to reinforce the rationale for or against a U.S. policy initiative."[20] "In these circumstances, receiving the same 'story' from more than one DO [director of operations, or other source] does not in itself speak to the authenticity of the information."[21]

In an attempt to understand power flows and uncertainty or deception, you must remember that analysis is a process— analytical steps steeped in rhetorical theory. Power and discontinuity analysis represent two effective ways to analyze a foe's actions or capabilities. However, prior to initiating any analysis, you need to understand that power (its conduits and flows) influences everyone. Consequently, Foucault's power influences can be found in every human organization and system. Now, you can look at an organization as a power being with a rhetorical circulatory structure supporting its existence. Power (Foucault's discourse and knowledge) flows through the entire organization. As a power-influenced (human conceptualized) entity, an organization has "spatial, temporal, and social compartmentalizations,"[22] which must have a physical means of sharing in-

formation in order to allow power to flow. If you understand the power movement, you can understand the entire organization.

The simplest example of an organization is two people occupying their individual compartmentalizations just a few feet away. You can observe them communicate (visually, verbally, or physically) and can watch what actions take place.[23] The conduits they use are shaped by "social processes, behavioral patterns, systems of norms, types of classification, [and] modes of characterization."[24] Through the proper vantage point (panopticon), you can learn more about how conduits are socially and physically shaped. You can then understand how and when power moves from compartment to compartment. The conduit—along with its content—may take the form of a simple verbal message from one person to another, or it could take on the form of an encoded satellite communication link from headquarters to the cockpit of an aircraft many miles away. Once each actual (suspected or possible) conduit is identified, you can associate actions and events with each type of power flow and conduit. Additionally, critical pivot points—as defined by the Foucaultian elements of economy, intensity, and linkage—can be isolated, attacked, or avoided. If you plot and highlight the conduit's pivot points, you can effectively map the power flow of any organization.

Power shifts, ruptures, and discontinuities in conduits can take on many forms when overlaid against a wide range of global norms. You must be aware that conduits can rapidly change, fail, and fall from expected norms. According to Foucault, "the problem is no longer one of tradition, of tracing a line, but one of division, of limits; it is no longer one of lasting foundations, but one of transformations that serve as new foundations, the rebuilding of foundations."[25] Importantly, many of these power transformations occur naturally. However, you must understand that deception can effectively hide or disguise transformations. Deception can affect your analysis of an organization: a standard consideration for CIA and military analysts. The CIA's *Tradecraft Notes* underscores a need to consider the possible use of deception from the beginning of your observation of an organization, system, or situation.

If uncertainty remains, you continue to focus on the threat power flow, but now you repeat the intelligence process with a different rhetorical perspective/lens.[26] The views of rhetorical theorists such as Kenneth Burke, I. A. Richards, and Walter Ong can also serve as superb perspectives for intelligence analysis. Power flow is one of an unlimited number of rhetorical tools. Historians and tacticians represent "the diversity of sources and thought that both enrich and complicate" analysis.[27] Hopefully, this (Foucaultian) rhetorical sampler illustrates at least one way theory can enrich your analytical perspective.

Unfortunately, all too often you underestimate the power flow and conduit capacity of an organization. You tend to gravitate towards a simple (inadequate) analysis of a threat country's capabilities. According to Eliot A. Cohen and John Gooch, an inadequate analysis—a setback the Israelis faced during the 1973 Yom Kippur War—results from "the products of a failure to think through the many dimensions of a changing strategic challenge."[28]

> Moreover, the IDF [Israel Defense Forces] underestimated the import of substantial improvements in the quality of Arab (and above all, Egyptian) training and coordination since 1967. Because of intensive Soviet advice and, more important, their own efforts, the Egyptian and Syrian armed forces had improved considerably since that war, at virtually every level. To be sure, the IDF had also made tremendous strides in this period, and hence many IDF officers then and since have argued that the relative gap remained the same or had even opened slightly in Israel's favor. The Israeli conception of relative advantage, however, oversimplified the changing relationship between the two sides.[29]

Equally devastating, you also tend to overestimate the power flow and conduit capability of our own military forces. A clear path to understanding our unintentional self-deceptions starts with a step towards understanding our (individual) power strengths and limitations, resulting in an effective "comparative assessment of doctrine and effectiveness"—a penetrating view providing a clear "net assessment" of any situation.[30]

Each one of us serves as a positive or negative pivot point in our organization's power flow. Take the time to learn more about yourself and the other power players in your unit. Learn from those who can successfully analyze the key pivot points and trip wires. Additionally, while in the trenches, document your successes and pass the best analytical processes throughout your

unit and the intelligence community, thereby establishing a powerful conduit for the "rebuilding of [rhetorical] foundations."[31]

Chapter 7

In the Trenches

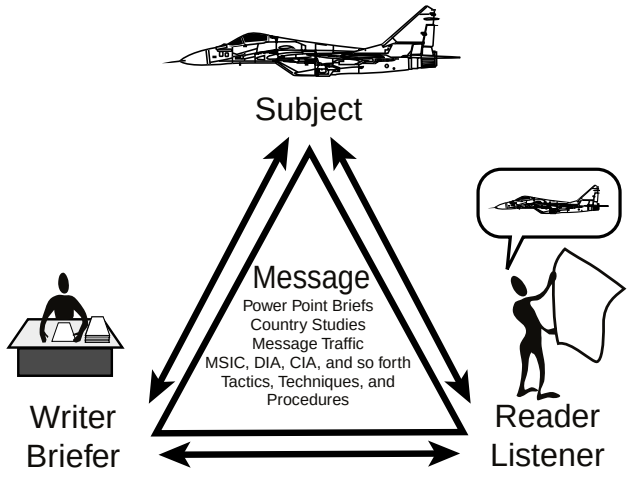
> *But war is not a true adventure. It is a mere ersatz [imitation]. Where ties are established, where problems are set, where creation is stimulated—there you have adventure.*
>
> —Antoine de Saint-Exupéry
> *Flight to Arras*

Real adventure begins at your first assignment when you interact with your primary customers (commanders, crews, and support personnel). The schoolhouse world quickly disappears in a flurry of daily demands. Within your office, you will experience influences of internal Foucaultian power surges from "innumerable points."[1] Some challenges to face include manpower reductions, equipment shortages, and many deployments, as well as a wide array of additional duties. High demand for intelligence support continues to increase as shown in the following photo. Simply put—you will be expected to do more with less. Fortunately, your understanding of rhetorical theory can help.

The F-16—referred to as the Viper by its pilots—is one of many systems you will be expected to support.

From force protection to follow-on test and evaluation of new aircraft and tactics, intelligence support is deeply seeded in daily military operations. Unfortunately, depending on your specific situation, the job may turn from intelligence operator to analysis "medic"—you will hustle to meet operational needs as quickly as they arrive. Usually, this is when theory takes a backseat to providing time-critical products. Yet, even during times of intelligence triage, a few quick notes concerning discourse analysis can help. For example, many well-organized briefings, summaries, and reports are readily available in classified and unclassified formats through the Internet. Specifically, your access to the high-speed Secret Internet Protocol Router Network system makes an incredible array of polished products available. In the trenches, you will depend increasingly on preanalyzed products as you pull down briefings to satisfy short-notice requests. These are excellent products; however, you need to keep in mind that most of these products are not targeted to your specific audience.

Erika Lindemann offers the communication triangle shown in figure 11 as a simple way to help define rhetorical problems.[2] The



Legend:
CIA, Central Intelligence Agency
DIA, Defense Intelligence Agency
MSIC, Missile and Space Intelligence Center

Figure 11. Communication Triangle

problem you will face is rapid adaptation of discourse products influenced by someone else's rhetorical perspective in order to satisfy your customers. As a quick and sound guide, the communication triangle can aid in the formulation of questions concerning the "relationship between terms [corners of the triangle]."[3] The triangle can be used to formulate questions concerning the author's relationship to the subject and audience as depicted in Lindemann's work.[4] Basically, you are "reverse engineering" the originating author's rhetorical process.

As you use products designed for other audiences, you must take on positions (fig. 12) of reader, then writer, editor, and, ultimately, briefer to your specific audience (commanders, crews, and others). Correspondingly, depending on the depth of your analysis, you can significantly enhance your final presentation.

Audience analysis, directly tied to the communication triangle, is critical to all forms of communication. "As you learn more about your audience, the possibilities for your own role as a writer [briefer] will become clearer."[5] This process can be energized by approaching and asking the audience for input. A good recommendation is that you should sit down with your new commanders and crews and ask them what they would

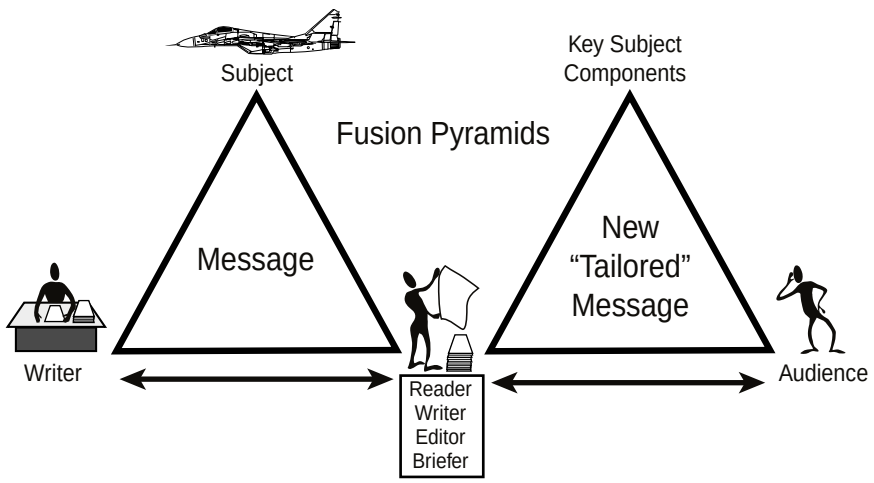


Figure 12. Communication Analysis

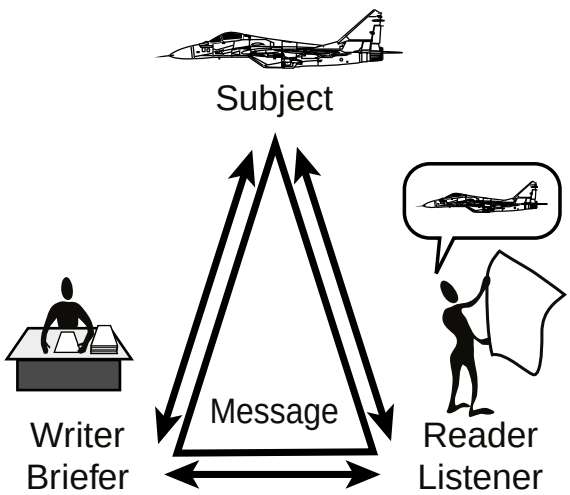
like to see. You will build tremendous ethos in the unit and significantly cut your presentation-tailoring time.

Additionally, analysts must ask some critical questions when they use the communication triangle. Specifically, you must understand your audience.[6] Development of an audience profile can help narrow and define audiences through a look at their ages, occupational specialties, and experiences.[7] As this writer (briefer)/reader (listener) relationship grows and matures, your communication triangle actually shrinks at the base; and your message moves with greater speed and clarity.[8] The new, enhanced triangle in figure 13 represents a comprehensive audience understanding, and the writer can use a medium that optimizes this advantage. The CIA, much like other intelligence organizations, skillfully uses audience analysis in order to tailor products "to the individual intelligence consumer's concerns."[9]



Chapter 8

Conclusion

> *So nations have armies to help them, rulers have ministers to assist them. When the helper is strong, the nation is secure; when the helper is weak, the nation is in peril.*
>
> —Sun Tzu
> *The Art of War*

Your primary job as analysts is to excel as the military's helpers to war fighters and decision makers. Hopefully, this discussion has assisted your "pursuit of expertise in analytic tradecraft" through a deeper understanding of rhetorical theory.[1] Rhetorical theory builds a superb foundation, enhancing the intelligence-analysis process at all levels of the discourse spectrum (from unit-level training to combatant-commander briefings). Specifically, the force of Foucault's power and discontinuity analysis provides an insightful analytical perspective.

As Admiral King emphasized, "It is particularly important to comprehend the enemy point of view in all aspects."[2] Importantly, the enemy point of view is in its greatest state of flux since the Cold War. The former Soviet Union, our Cold War "enemy," has transformed from a power-projection threat into an advanced weapons-proliferation concern. Although this transition is troubling, smaller, highly unconventional threats (countries, organizations, and threat systems) are now in the forefront, resulting in some of the greatest challenges for intelligence analysts. Consider the unconventional attacks orchestrated by Osama bin Laden, resulting in the near-simultaneous bombing attacks on the US embassies in Nairobi, Kenya, and Dar es Salaam, Tanzania, on 7 August 1998. Additionally, the 11 September 2001 attacks on the World Trade Center and the Pentagon underscored a critical need to modify our understanding of the enemy point of view.

As an unconventional analytical source, Foucault provides new power perspectives for intelligence analysis, and he gives

US Embassy Damaged by Terrorists in Tanzania

an unconventional look at an ever-growing unconventional threat environment. Foucault's analytical edge helps confront these threats "by refusing to separate off knowledge from power."[3] "His strategy has been to focus his work, both political and intellectual, on what he sees as the greatest threat—that strange, somewhat unlikely, mixing of the social science and social practices developed around subjectivity."[4] Foucault's theories address the human behind the satellite images and database numbers. He reminds you to "distinguish among events, to differentiate the networks and levels to which they belong, and to reconstitute the lines along which they are connected and engender one another."[5]

Some of you are already using many components of these powerful rhetorical tools. Some organizations, such as the CIA, are compiling key elements of these theories that directly apply to their craft. These theories work to bridge practical application gaps in the intelligence community—enhancing our ability to adapt and thwart failure. Eliot A. Cohen and John Gooch, authors of *Military Misfortunes: The Anatomy of Failure in War,* underscore the basic reasons for failure in military organizations:

"failure to learn, failure to anticipate, and failure to adapt."[6] Theory allows you to learn from rhetorical lessons of the past, resulting in an intelligence service that can anticipate and adapt to power flows, shifts, ruptures, and discontinuities. These authors also underscore the importance of the skill of adaptation (specifically referencing the US Navy's recovery from a string of setbacks during its 1940–42 antisubmarine warfare campaign): "Indeed, the ability to adapt is probably most useful to any military organization and most characteristic of successful ones, for with it, it is possible to overcome both learning and predictive failures. In the interim, however, the cost of such failures will be—and in the case was—high, in terms of blood, treasure, and time."[7] The end result of an enhanced understanding of theory is an adaptive intelligence organization that is able to provide a comprehensive view of the battle space to war fighters. As intelligence operators, you must strive to enhance your analytical growth through rhetorical theory—a force-multiplying education that extends our comprehension of an evolving, growing threat environment.

13. ABSTRACT (maximum 200 words)

The purpose of this thesis was to examine the employment and adherence of the intelligence cycle process model within the National Network of Fusion Centers and the greater Homeland Security Enterprise by exploring the customary intelligence cycle process model established by the United States Intelligence Community (USIC). This thesis revealed there are various intelligence cycle process models used by the USIC and taught to the National Network. Given the numerous different training entities and varied intelligence cycle process models, challenges exist with providing a well-defined training program that ensures consistent and clear intelligence cycle process model employment. Finally, this thesis offers an overview pertinent to researchers and/or practitioners regarding the viability of employing the intelligence cycle process model as the principle guide for domestic intelligence activities.

This thesis employed a qualitative research method that analyzed and interpreted publicly available academic and policy information gathered from government and nongovernment institutions regarding the conceptual and practical intelligence cycle process model narratives. A case study analysis was conducted of the April 15, 2013, Boston Marathon bombing as a platform to discuss the active and effective employment of the intelligence cycle process model by the National Network.

The principal conclusion offers while literature clearly agrees the intelligence cycle process model is a cyclical structure of actions, literature also finds there are common themes suggesting the intelligence cycle does not sufficiently describe how the intelligence process works at the operational stages of domestic intelligence activities within the National Network.

EXECUTIVE SUMMARY

The United States Intelligence Community (USIC) was not designed to serve as a concept intended to detect significant national security threats originating or residing within our nation's borders, but it was focused on foreign intelligence activities. Little research has been done to study the post-9/11 Homeland Security Enterprise (HSE) counterterrorism efforts supporting domestic intelligence activities and its reliance on the intelligence cycle process model. This thesis evaluates whether the intelligence cycle process model supports the performance of domestic intelligence activities, specifically within the National Network of Fusion Centers (National Network) and the greater HSE.

The unprecedented September 11, 2001, terrorist attacks brought into question the USIC intelligence collection capabilities and served as the catalyst for state, local, tribal and private sector partners into the HSE. The DHS 2011 National Network of Fusion Centers Final Report defined the HSE as federal, state, local, tribal, nongovernmental, and private sector entities. The HSE serves organized complex organizations and their relationships through the National Network. The National Network allows for the integration of the HSE as nontraditional intelligence entities employing intelligence collection and analysis. The National Network and broader HSE have become essential elements providing support to the national intelligence architecture.

Originally, the 1947 USIC structure and the function of its intelligence cycle process model was designed to provide essential information to the president, policymakers, federal organizations, and military communities. The 1947 USIC structure has expanded to its current structure that includes 17 organizations charged with conducting intelligence activities – both foreign and domestic. Today, the growth of the USIC and its purpose has expanded beyond federal elements to include the National Network and the HSE in order to enhance domestic intelligence capabilities.

An assessment of the limited information made available that focuses on domestic intelligence and the intelligence cycle employment reveals information gaps concerning its effectiveness and appropriateness within the post-9/11 HSE. While literature clearly agrees the intelligence cycle process model is a cyclical structure of actions, literature also finds there are common themes suggesting the intelligence cycle does not sufficiently describe how the intelligence process works at the operational stages of domestic intelligence activities within the National Network.

This thesis offers an overview pertinent to researchers and/or practitioners regarding the viability of employing the intelligence cycle process model as the principle guide for domestic intelligence collection activities. Intelligence derived from analyzed information through the intelligence cycle process serves as a principle tool for supporting the nation's counterterrorism efforts and offers law enforcement and homeland security officials with insights and advantages over terrorists. However, there are multiple intelligence cycle concepts within the USIC and the HSE. The various intelligence cycle process models range from a four-step process to a seven-step process.

There are various intelligence cycle process models used by the USIC and now being taught to the National Network by federally funded entities. As an example, the DHS Office of Intelligence and Analysis (I&A), the National Counterterrorism Center, the Memorial Institute for the Prevention of Terrorism (MIPT), the Department of Justice State and Local Anti-terrorism Training Program, and the International Association of Law Enforcement Intelligence Analysts (IALEA) each deliver intelligence training opportunities enthusiastic of the intelligence cycle process model. Given the number of different training entities and varied intelligence cycle process models, challenges exist with providing a well-defined training program that ensures consistent and clear intelligence cycle process model employment within the National Network.

A case study analysis of the April 15, 2013, Boston Marathon bombing illuminates adherence to the intelligence cycle process model as a proactive approach that may have prevented the bombing. This case study was selected in an effort demonstrate the conceptual intelligence cycle process model, in action. Additionally, it

offers the challenges with employing the intelligence cycle process model as an element of the 2003 National Criminal Information Sharing Plan (NCISP) in efforts to prevent terrorism.

The literature provided no USIC or HSE doctrinal information on the adoption of the intelligence cycle as a formal process by USIC or HSE members. Providing comprehensive, consistent intelligence cycle process training to the National Network may serve to decrease privacy concerns while also verifying a concerted federal effort in the fitting execution of domestic intelligence activities. Drawing on publicly available information from government, academia, and national security consortiums, analysis revealed broad acceptance of the intelligence cycle process model philosophy. However, literature provided by academic and operational practitioners support claims that the intelligence cycle process model is flawed and not practical in the operational environment. This thesis may serve as a basis for recommending additional research necessary for studying the intelligence cycle process model implementation and employment within the post-9/11 HSE and its effectiveness in preventing terrorist attacks and enhancing national security intelligence.

ACKNOWLEDGMENTS

Jeremiah 33:3 – “Call unto Me and I will answer you, and tell you great and hidden things that you have not known.” (ESV)

I would like to thank my wonderful wife, Nikkia, and children, Xavier and Isaiah, for their support and sacrifices during the time spent away doing my academic work. May they forever live in the blessings of God.

Finally, I would like to thank my thesis advisors, Dr. Kathleen Kiernan and Mr. John Rollins, as their steady guidance throughout the thesis process was both insightful and encouraging. Thank you for your words of support and direction.

To the senior leadership, Mr. Scott McAllister and Mr. Robin Taylor, of the DHS Office of Intelligence and Analysis, State and Local Program Office for their support in making this endeavor a reality.

Moreover, to the men and women of the United States Intelligence Community, the United States Military, Federal and Domestic Law Enforcement, the Fire Service, Emergency Management and Emergency Medical Services who protect this nation on a daily basis. May God watch over and protect you.

THIS PAGE INTENTIONALLY LEFT BLANK

I. INTRODUCTION

The topic discussed in this thesis is important to the author, and as such, presents a degree of theoretical sensitivities. This thesis runs the risk of slight bias towards the intelligence cycle process model from the federal level and national security intelligence perspective; juxtapose the nontraditional criminal intelligence perspective at the state and local level. The author's own professional experiences as a retired intelligence collector with the U.S. Army Military Intelligence Corps/Defense Intelligence Agency, former Federal Bureau of Investigation Supervisory Intelligence Analyst and current DHS Senior Intelligence Officer have been useful in understanding the policy and practical challenges related to employing the intelligence cycle process model.

However, the intent of this research is to serve as an introduction and description of the issues necessary to explore employing the customary intelligence cycle process model established by the United States Intelligence Community (USIC) within the National Network of Fusion Centers (National Network) and the greater Homeland Security Enterprise (HSE). The information offered delivers an overview pertinent to researchers and/or practitioners regarding the viability of employing the intelligence cycle process model as the principle guide for domestic intelligence collection activities.

On September 11, 2001, the unthinkable happened. International terrorists residing in the US brought into question the USIC intelligence collection capabilities and served as the catalyst for state, local, tribal and private sector partners into the HSE. Immediately following the devastating strike, the nation focused all of its intelligence collection efforts on the prevention of future terrorist attacks from abroad and from within. Nine separate national strategies were written to address elements of homeland security. They include, in part, a National Intelligence Strategy published by the Office of the Director of National Intelligence (DNI) in 2005; a National Strategy for Homeland Security published by the White House in 2007; a National Counterintelligence Strategy published by the DNI in 2009; a National Security Strategy of the United States published by the White House in 2010; a National Counterterrorism Strategy published by the White House in 2011, and most recently a National Strategy for Information

Sharing and Safeguarding published by the White House in 2012. The lack of any national level guidance or strategy related to the collection of domestic intelligence within the HSE other than organizational relationships, classified, or otherwise appears to be a glaring oversight.

The DHS *2011 National Network of Fusion Centers Final Report* defined the HSE as federal, state, local, tribal, nongovernmental, and private sector entities.[1] The HSE serves organized complex organizations, and their relationships with the national intelligence architecture through the National Network. Collecting and analyzing information through the National Network combines state and local criminal intelligence and national intelligence to address transnational threats.[2] The National Network in partnership with the HSE provides an essential information collection and analysis function in efforts to prevent terrorist attacks within the homeland.

Within this complex HSE, there are several USIC intelligence cycle process models being taught. Given today's transnational threat environment, this thesis is intended to inform readers regarding the adaptation and adherence to the intelligence cycle process model within the HSE. The adherence to a consistent intelligence cycle process model within the National Network, as an internal entity of the complex HSE, is critical to producing common operating threat pictures at all levels of government.

The National Network is the integration of nontraditional intelligence entities into the practice of intelligence collection and analysis essential for supporting the national intelligence architecture. In order to examine the National Network's adeptness to adapt to the intelligence cycle process model, it is fitting to review the history of the USIC germane to the intelligence process. The USIC serves as a coalition of agencies and organizations that work both independently and collaboratively with the primary mission

[1] U.S. Department of Homeland Security, *2011 National Network of Fusion Centers Final Report*, May 2012, 2.

[2] 50 U.S. Code Section 402(i)(5) defines transnational threats as any transnational activity (including international terrorism, narcotics trafficking, the proliferation of weapons of mass destruction and the delivery systems for such weapons, and organized crime) that threatens the national security of the United States that includes any individual or group that engages in such activity.

to collect and produce intelligence. The USIC has evolved tremendously in size, structure, and scope since its creation more than 60 years ago following World War II and the 1947 National Security Act. However, the conceptual intelligence cycle process has essentially gone unchanged since its inception. Notwithstanding, the intelligence cycle process phases or steps have increased over the years.

Over the 60 years the USIC has existed, domestic intelligence activities have raised serious concerns regarding privacy, civil rights and civil liberties as a result of abuses of authority and illegal behavior by federal and local law enforcement intelligence entities. Providing federally funded training to the National Network that supports employing the intelligence cycle process model is once again raising concerns among privacy advocates and American citizens. Providing comprehensive, consistent intelligence cycle process training to the National Network may serve to decrease privacy concerns while also verifying a concerted federal effort in the proper execution of the intelligence process. Literature reveals even the best analysis will do nothing to affect national security and crime rates at the state and local level, if it does not influence practices within the National Network.

Chapter II offers a literature review essential for identifying critical premises, as well as contributions necessary for exploring the adherence to the intelligence cycle process model within the National Network. The main goal of the literature review is to understand intelligence cycle process models and to provide context for homeland security and intelligence professionals. Fundamental to this chapter is defining the USIC, the Homeland Security Intelligence Enterprise (HSIE), the HSE, and key intelligence terms. As important is the identification and illumination of the various intelligence cycle process models being used within the HSE.

The 1947 USIC structure has expanded to its current structure that includes 17 organizations charged with conducting intelligence activities both foreign and domestic. The 17-member USIC is composed of a community coordinator, six program managers, five departmental elements, and five services. The Office of the Director of National Intelligence serves as the USIC community coordinator. The six USIC entities that serve as intelligence program managers are the Central Intelligence Agency, the Defense

Intelligence Agency, the National Security Agency, the National Reconnaissance Office, Federal Bureau of Investigation (National Security Branch), and the National Geospatial-Intelligence Agency. The five departmental elements identified as USIC members within specific organizations are the Department of Energy's Office of Intelligence and Counterintelligence, the Drug Enforcement Administration's Office of National Security Intelligence, the Department of Homeland Security's Office of Intelligence and Analysis, the Department of State's Bureau of Intelligence and Research, and the Department of the Treasury's Office of Intelligence and Research. The five services identified as USIC members are US Air Force Intelligence, US Army Intelligence, US Coast Guard Intelligence, US Marine Corps Intelligence, and US Navy Intelligence.[3]

Originally, the 1947 USIC structure and the function of its intelligence cycle process model were designed to provide essential information to the president, policymakers, federal organizations, and military communities. Today, the growth of the USIC and its purpose has expanded beyond federal elements to include state, local, tribal, nongovernmental, and private sector entities necessary to enhance domestic intelligence capabilities.

Chapter III is intended to offer illustrations relevant to the challenges of executing domestic intelligence activities. The central points are identifying the national security focus of domestic intelligence policies, the exploitation of domestic intelligence authorities and cultural differences between the USIC and elements of the HSE that affect the employment of the intelligence cycle process model.

Chapter IV presents a case study of the April 15, 2013, Boston Marathon bombing in the context of the intelligence cycle process model adherence necessary to detect the threat and provide intelligence to policy and decision makers with information in order to prevent the bombing. This case study was selected in an effort demonstrate the conceptual intelligence cycle process model, in action, within the context of the National Network and the broader HSE. Additionally, the case study offers the challenges with employing the intelligence cycle process model within the National Network at the state

[3] "About the Intelligence Community," Intelligence.gov, accessed July 12, 2013, http://www.intelligence.gov/about-the-intelligence-community/.

and local level and supporting the 2003 National Criminal Information Sharing Plan (NCISP) efforts to prevent terrorism.

Chapter V is intended to offer a reading on the intelligence cycle process model and the HSE relevant to intelligence cycle model training and national integration of state and local law enforcement, the private sector, and implementation challenges given the complex HSE.

A. PROBLEM STATEMENT

The USIC was not designed to serve as a concept intended to detect significant national security threats originating or residing within our nation's borders[4] but was focused on foreign intelligence activities. This thesis evaluates if the intelligence cycle process model supports the performance of domestic intelligence activities within the National Network that serve as focal points within the state and local environment for the receipt, analysis, gathering, and sharing of threat-related information between the federal government and state, local, tribal, territorial and private sector partners.[5] Research provided little has been done to study the weaving together of local, state, and federal counterterrorism efforts[6] that support domestic intelligence activities and the reliance on the intelligence cycle process model.

The National Network has been in development since 2003 and was established to serve as intelligence and analytical hubs[7] at the state, local, tribal, and territorial level. The National Network is supported by training and technical assistance in employing the intelligence cycle process model from DHS, the Department of Justice (DOJ), and other

[4] Intelligence and National Security Alliance, *Intelligence to Protect the Homeland: Taking Stock Ten Years Later and Looking Ahead*. White paper, Arlington: Homeland Security Intelligence Council, 2011.

[5] U.S. Department of Homeland Security, accessed June 7, 2013, http://www.dhs.gov/state-and-major-urban-area-fusion-centers.

institutions. Providing federally funded training to the National Network on intelligence cycle process model variations, and their employment philosophies, serve as limitations to establishing fusion center baseline capabilities and their integration into national intelligence. Annual assessments are conducted on the National Network by DHS in efforts to evaluate baseline capabilities and their integration into national intelligence. The National Network completes an Online Self Assessment Tool that includes numerous multiple-choice and "yes/no" questions focused on the critical operational capabilities (COC) in support of the 2011 and 2012 DHS-led fusion center assessments.[8] While the COC questions focus on distinct aspects of the intelligence cycle process model, the 2011 and 2012 assessments do not evaluate the adherence to or wholly employing the intelligence cycle process model. A publication written by noted author and academic David Carter, who developed a local intelligence guide titled *Law Enforcement Intelligence: A Guide for State, Local, and Tribal Law Enforcement Agencies*, affirms, "the need for a different approach to the intelligence cycle exists for the federal level compared to state, local, tribal and territorial elements because of different intelligence demands."[9]

The July 2010 DHS Bottom Up Review (BUR) that provides the results of a department-wide assessment reported, "there had been no systematic effort to ensure that these centers establish and maintain a baseline level of capability so that they are able to become fully integrated into national efforts to gather, analyze, and share information needed to protect our communities."[10] The 2010 BUR was addressed by the subsequent annual DHS-led National Network assessments. Notwithstanding, elements external to the National Network observed continued challenges with integrating local elements within the national intelligence architecture. A 2011 report by The Homeland Security

[8] U.S. Department of Homeland Security, *2012 National Network of Fusion Centers Final Report*, accessed October 8, 2013, http://www.dhs.gov/sites/default/files/publications/2012%20National%20Network%20of%20Fusion%20Centers%20Final%20Report.pdf.

[10] U.S. Department of Homeland Security, *Bottom-Up Review Report*, July 2010.

Policy Institute's Counterterrorism Intelligence Survey Research indicated 62 percent of the intelligence chiefs representing major metropolitan police departments in the U.S. believed the "national [federal] intelligence enterprise was such that it left them unable to develop a complete understanding of their local threat environment"[11] — an intended product of the intelligence cycle process model.

B. OVERVIEW

Intelligence derived from analyzed information through the intelligence cycle process serves as a principle tool for supporting the nation's counterterrorism efforts and offers law enforcement and homeland security officials with insights and advantages over terrorists. However, there are multiple intelligence cycle concepts within the USIC and the HSE. The various intelligence cycle process models range from a four-step process to a seven-step process.

The first depicted model of an intelligence cycle process was documented in 1944 and titled the *Production of Military Intelligence, a Continuous Process*.[12] Moreover, in 1948, Robert Rigby Glass published a book titled *Intelligence for Commanders* becoming the first known academic reference to an intelligence cycle process.[13] Subsequently there have been numerous books about the USIC and the intelligence cycle process. Author Leo D. Carl refers to the intelligence cycle as a five-step process in his 1990 book titled *The International Dictionary of Intelligence*.[14] Author Robert M. Clark in his 2004 *Intelligence Analysis: A Target-Centric Approach* refers to the traditional intelligence cycle as a six-step process.[15] The Naval Postgraduate School's Center for Homeland

[14] Leo d. Carl, *The International Dictionary of Intelligence* (McLean, VA. International Defense Consulting Service, 1990), 183.

[15] Robert M. Clark, *Intelligence Analysis: A Target-Centric Approach* (Washington, D.C.: CQ Press, 2004), 14.

Defense and Security Course NS4146 titled *Intelligence for Homeland Security*, by Dr. William Lahneman, refers to a seven-step process. The aforementioned noting of intelligence cycle process models reveals the diverse number of models and aids in identifying the potential challenges with providing consistent training and adherence to the National Network and the greater HSE. The DHS Homeland Security Advisory Council (HSAC), which provides advice and recommendations to the DHS Secretary on matters related to homeland security, noted effective intelligence and information fusion requires reliance on existing traditional USIC analytic processes. The HSAC defined "fusion" as a cyclic process that includes elements of a five-step intelligence cycle process.[16] This provides yet another version of the intelligence cycle process model. Table 1 provides a depiction of different intelligence cycle process models of USIC members, academia, and a state and local law enforcement element.

[16] U.S. Department of Homeland Security, *Intelligence and Information Sharing Initiative: Homeland Security Intelligence and Information Fusion*. Homeland Security Advisory Council. April 28, 2005, 5–7.

Table 1. The Various Types of Organizational Intelligence Cycle Models and Attributes

	Requirements	Planning & Direction	Collection	Processing & Exploitation	Analysis & Production	Dissemination	Consumption	Evaluation & Feedback
CIA		X	X	X	X	X		
FBI	X	X	X	X	X	X		
U.S. Air Force		X	X	X	X (Production)	X (Integration)		
U.S. Army		X	X	X		X		
U.S. Marine Corps		X	X	X	X (Production)	X	X (Utilization)	
U.S. Navy		X	X	X (Processing)	X (Production)	X		
DoD Joint Pub		X	X	X	X	X (Integration)		X
HSAC		X (Requirements Development)	X		X (Analysis)	X (Tasking, Archiving)		X (Reevaluation)
	Requirements	Planning & Direction	Collection	Processing & Exploitation	Analysis & Production	Dissemination	Consumption	Evaluation & Feedback
IOWA DPS		X	X	X (Processing)	X	X		
NPS-CHDS	X		X	X	X	X	X	X
PENN STATE		X (Planning, Direction, Needs, Requirements)	X	X	X (Analysis)	X		

The single intelligence cycle attribute used by all within the various intelligence cycle models is the “collection” phase. There are various intelligence cycle process models used by the USIC and now being taught to the National Network by federally funded entities. As an example, the DHS Office of Intelligence and Analysis (I&A), the

National Counterterrorism Center, the Memorial Institute for the Prevention of Terrorism (MIPT), the Department of Justice State and Local Anti-terrorism Training Program, and the International Association of Law Enforcement Intelligence Analysts (IALEA) each deliver intelligence training opportunities on intelligence cycle process model. The complexities of HSE are intensified when observed through the lens of different training entities and varied intelligence cycle process models. Consistent and clear intelligence cycle process employment within the National Network presents challenges with integration into the national intelligence architecture without a uniform training.

C. RESEARCH OBJECTIVES AND METHODOLOGY

The research process applies the basic program evaluation principles to gather information on the intelligence cycle process model adherence within the National Network and greater HSE. The research objective seeks to evaluate whether the National Network and HSE members adhere to the intelligence cycle process model when performing public safety and homeland security related missions.

This thesis employs a qualitative research method that analyzes and interprets publicly available academic and policy information gathered from government and nongovernment institutions regarding the conceptual and practical writings relevant to the intelligence cycle process model. In addition to the academic and policy data gathered, the writer provides a case study analysis of the April 15, 2013, Boston Marathon bombing focused on practical adherence to the phases of a general intelligence cycle process model. The applied research method is intended to provide the framework for exploring the employment of the intelligence cycle process model within the current HSE. A case study approach was chosen in an effort to explore adherence to the intelligence cycle process within the National Network in context to its origin and intended purpose. It is in this setting that the writer explores the National Network's adherence to the intelligence cycle process model considering their integration as a critical state and local asset within the broader national intelligence architecture.

Employing the intelligence cycle process model within the National Network and the greater HSE presents privacy concerns. Literature reveals these privacy concerns are

focused on the collection of information on Americans who have not violated the rule of law. Privacy concerns among policymakers also exist regarding the proper collection of information in support of domestic intelligence activities engagement by public and private HSE entities. Lastly, scholars and practitioners present concerns questioning whether the intelligence cycle process model serves as effective analytic tradecraft in reducing strategic surprises associated with a threat while simultaneously enhancing operational law enforcement and intelligence elements.

THIS PAGE INTENTIONALLY LEFT BLANK

II. LITERATURE REVIEW

The significance of examining the intelligence cycle process model within the HSE is well intentioned given it was not originally designed or intended to detect significant national security threats originating or residing within our nation's borders.[17] The literature examined provided a spectrum of knowledge about the intelligence cycle process model within the pre- and post-9/11 domestic intelligence environment. The evaluation of intelligence literature provided by academic, organizational and nongovernment consulting institutions revealed minimal discourse concerning the intelligence cycle process employment to support domestic intelligence activities.

The research literature includes publications from within and outside the government by high-level policy organizations and academia. The concentration of government publications reviewed were congressional legislation associated with homeland security and intelligence, as well as homeland security intelligence reports and information sharing related products of the Government Accountability Office and Congressional Research Service. A review of public and nonprofit organizations serving as consultants to the intelligence community and homeland security provided intelligence journals and articles, as well as academic intelligence publications by the Department of Defense (DoD) and public institutions. Finally, as appropriate, USIC organizational and National Network documents were reviewed specifically relating to intelligence cycle process model training and policies.

The literature review provided no USIC or HSE doctrinal information on the adoption of the intelligence cycle as a formal process by USIC or HSE members. Additionally, there are no specific standards concerning intelligence processes for domestic intelligence collection, whether at the federal level or the state and local level. However, there are documents that provide guiding principles regarding domestic intelligence collection and the use of the intelligence cycle process. The principle document governing the USIC (federal-level) role relevant to domestic intelligence

[17] Intelligence and National Security Alliance, *Intelligence to Protect the Homeland: Taking Stock Ten Years Later and Looking Ahead*. White paper, Arlington: Homeland Security Intelligence Council, 2011.

activities is Presidential Executive Order (EO) 12333. The DHS/DOJ endorsed guidelines for introducing the intelligence cycle process model into the National Network are the 2006 Fusion Center Guidelines[18] and the TCL[19] for state and local partners operating externally to the National Network. In March 2002, during an Intelligence Summit, the International Association of Chiefs of Police (IACP), an organization established in 1893 to serve as the professional voice of law enforcement, adopted the intelligence-led policing philosophy.[20] In 2011, the Major City Chief's Association (MCCA) initiated the Major City Chiefs' Criminal Intelligence Enterprise (MCCCIE) to better integrate state and local criminal intelligence and counterterrorism operations and address the deficiencies of standardizing integration and intelligence collection practices.[21] These guiding principles focus on the administration and management of the collection process, not necessarily a standardized employment of an intelligence cycle process model. An assessment of the limited information made available that focuses on domestic intelligence and the intelligence cycle employment reveals information gaps concerning its effectiveness and appropriateness within the post-9/11 HSE. This thesis attempts to explore whether the intelligence cycle is the best process model for domestic intelligence.

This literature review includes defining key intelligence enterprises, the term "intelligence" within the USIC and law enforcement, intelligence cycle process models, and training the intelligence cycle process to the HSE and National Network. The key intelligence enterprises discussed are the USIC, the Homeland Security Intelligence Enterprise (HSIE), and the HSE.

A. DEFINING KEY INTELLIGENCE ENTERPRISES AND THE TERM "INTELLIGENCE"

The USIC is formally defined in EO 12333 titled *United States Intelligence Activities*. An EO serves as an official document to manage the operations of the federal government.[22] The EO 12333 is an extremely complex order that sets forth the foundation of the USIC and the administration's directions regarding "timely and accurate information about the activities, capabilities, plans, and intentions of foreign powers, organizations, and persons and their agents."[23] Its support of national security consists of three key parts: Part 1) defines each intelligence community member and the particular roles and responsibilities; Part 2) focuses on the protection of civil liberties and privacy rights; and Part 3) provides relevant definitions. The 17-members consisting of the USIC are primarily concerned with foreign intelligence and counterintelligence, as prescribed in EO 12333, with the only agencies focusing on domestic intelligence are the

FBI and the newly created DHS.[24] EO 12333 was originally signed in 1981 under the Reagan Administration and since amended in 2008 under the Bush Administration because of the 9/11 terrorist attacks. EO 12333 provides the goals, direction, and responsibilities of USIC members performing intelligence activities within the U.S. There have been several amendments to EO 12333 since the original signing: in 2003 by EO 13284, in 2004 by EO 13355, and lastly in 2008 by EO 13470. The 2003 amendment by EO 13284 provided for the inclusion of the DHS Office of Intelligence and Analysis. The 2004 amendment by EO 13355 was designed to strengthen the management of the intelligence community. Lastly, the 2008 amendment by EO 13470 made administrative changes, to include language focused on state, local, and tribal governments as well as the private sector:

> State, local, and tribal governments are critical partners in securing and defending the United States from terrorism and other threats to the United

> States and its interests. Our national intelligence effort should take into account the responsibilities and requirements of state, local and tribal governments and, as appropriate, private sector entities, when undertaking the collection and dissemination of information and intelligence to protect the United States.[25]

While every USIC member has the authority and responsibility for implementing EO 12333 within their respective organizations, the two chief organizations responsible for ensuring successful implementing and providing direction is the DNI and DOJ/FBI.

The DHS HSIE consists of three DHS headquarter elements that have an intelligence function: The Office of Intelligence and Analysis, the Homeland Infrastructure Threat and Risk Analysis Center, and the Intelligence Division of the Office of Operations Coordination and Planning. It also consists of the intelligence element of six operational components: U.S. Customs and Border Protection, U.S. Immigration and Customs Enforcement, U.S. Citizenship and Immigration Services, Transportation Security Administration, U.S. Coast Guard, and U.S. Secret Service.[26] While there is a described HSIE, the term *homeland security intelligence* has yet to be defined or codified in law.[27] Noted author Frances Townsend, the former Homeland Security Advisor under President Bush and former Chairwoman of the nonprofit, public-private organization Intelligence and National Security Alliance, defined *homeland security intelligence* as a discipline that depends on the successful fusion of foreign and domestic intelligence to produce the kind of actionable intelligence necessary to protect the homeland.[28]

The DHS Undersecretary for Intelligence and Analysis serves as the Department's Chief Intelligence Officer (CINT) responsible for leading the HSIE. The DHS' Management Directive Number 8110 titled *Intelligence Integration and Management*

established the CINT position to effectively integrate and manage DHS intelligence programs, as well as serve as the principle for leading, governing, integrating, and managing intelligence functions throughout DHS.[29] The DHS CINT is tasked with being the primary connection between DHS and the USIC, as well as the primary source of information for state, local, tribal, and private sector partners. To date, there has only been two Senate confirmed DHS CINTs. The first CINT was the Honorable Charles Allen, a 40-year senior Central Intelligence Agency official who served as the first DHS CINT from 2005–2009 and was responsible for developing the department's intelligence architecture.[30] The second CINT was the Honorable Caryn Wagner, a 30-year DoD official who served as the DHS CINT from 2010 to 2012[31] and during her tenure provided a focus of "creating a true homeland security information-sharing enterprise through a greater focus on state, local, and major urban area fusion centers," as well as "unify and sustain the DHS intelligence enterprise."[32]

The HSE was defined by a DHS report on the National Network as federal, state, local, tribal, nongovernmental, and private sector entities.[33] Integration of the HSE into the national intelligence architecture was intended to occur through the National Network. Other than the 2011 DHS report, the examination of literature does not provide any other formal HSE definition, although the term is frequently used in government and academic articles. Similar to the term *homeland security intelligence*, the failure to provide a unified and accepted definition among stakeholders encumbers the ability to assess the effectiveness of the intelligence cycle process model.

Intelligence is a term that has multiple meanings dependent upon the literary contribution whether it has a USIC or law enforcement origin. An examination of literature commonly discussed what "intelligence" means or at least how an author intended to use the term. Prior to the terrorist attacks of September 11, 2011, academic and federal government literature largely referred to intelligence within the context of issues related to national security associated with defense, foreign policy, and internal (domestic) security.[34] However, the term "intelligence" within the context of law enforcement often refers to significant information that is relevant to an impending event and that will be a contribution to the positive outcome of a specific case.[35] Lowenthal subscribes that intelligence can be defined from three different perspectives: 1) "Intelligence as a product – intelligence that can be thought of as a product of the [process]," 2) "Intelligence as a process – intelligence [that] can be thought of as the means by which certain types of information are required and requested, collected, analyzed, and disseminated…," and 3) "Intelligence as an organization – intelligence…thought of as the units that carry out its various functions."[36]

In the post-9/11 environment, intelligence began to be more widely accepted and used among state, local, tribal, territorial, and private sector elements as key partners within the HSE. For the purpose of this thesis, "intelligence" is defined as the collective "functions [and] activities…which are involved in the [intelligence] process [model] of planning, gathering, and analyzing information of potential value to decision makers."[37]

B. INTELLIGENCE CYCLE PROCESS MODELS

A review of journals and scholarly publications provided descriptions of intelligence cycle process models. However, it was difficult uncovering its origination and the policies associated with its formal adoption within the USIC. According to the International Journal of Information Management, an international peer-reviewed journal, the use of the intelligence cycle was first derived from the U.S. Army.[38] In 1920, the Army's Chief of Staff attempted to establish the first Army-wide intelligence doctrine via the distribution of *Intelligence Regulations.*[39] Author Michael Bigelow, Command Historian with the U.S. Army Intelligence and Security Command, contends the first depicted model of the intelligence process was documented in 1944, under the title the *Production of Military Intelligence, a Continuous Process.*[40]

In 1952, intelligence collection, the single most common intelligence cycle attribute was defined as the procuring, assembling and organizing of information and served as the first step in the processing of intelligence information. It is now considered the third step or phase in the intelligence cycle process model and "…officially defined as 'the exploitation of sources of information by collection agencies and delivery of information to the proper intelligence-processing unit for use in the production of intelligence.'"[41] The 1952 definition focused on intelligence collection targeted against communist nation-states and not the domestic intelligence environment of today.

The intelligence cycle process model in simple discourse involves structured steps necessary for gathering required data in order to create knowledge. The created knowledge (intelligence) in the early years served executive and congressional policymakers primarily focused on Cold War adversaries in an attempt to uncover foreign intelligence activities and assist with supporting global national security interests.

Prior to the September 11 terrorist attacks, the FBI served as the principle federal agency responsible for domestic intelligence. In response to criticism by Congress following the attacks, the FBI initiated reforms to increase their collection and analysis of domestic intelligence. Nonetheless, critics contend FBI intelligence collection play a secondary role to their law enforcement mission.[42] Because of the September 11, 2001, Al-Qaida terrorist attacks that emphasized intelligence failures, the stated integration of the intelligence cycle process model became a common theme among public safety officials at the state, local, tribal, territorial and private sector levels. The new intelligence mission has by both necessity and practice expanded beyond the federal-level originally identified in the 1947 National Security Act and is now based on the principle of shared responsibility and partnership with state and local governments, the private sector, and the American people in a concerted national effort to prevent future terrorist attacks within the U.S.[43]

There are multiple intelligence cycle process model versions within the USIC, the HSIE and the HSE, which range from four-step process to a seven-step process. Many authors indicated that the intelligence cycle process model is more or less a common practice of how intelligence professionals perform the functions of intelligence. For the purpose of this thesis, the intelligence cycle is defined according to the official USIC definition as "the steps by which information is acquired and converted into intelligence and made available to consumers."[44] Similarly to the many academic descriptions of the intelligence cycle process models, USIC organizational models depend on the organization and its mission-space. The diverse number of intelligence cycle models stresses the need for an HSE-wide accepted intelligence cycle process doctrine.

C. CORE ISSUE

The intelligence cycle process model continually strives to better understand the threat environment or a threat issue. Understanding is accomplished and supported by relying on past and present information necessary to deliver a probabilistic view of the future. The basic intelligence cycle process model involves sequenced steps necessary for gathering the information in order to create the desired understanding. While literature plainly reveals the cyclical structure of intelligence cycle process model, literature also suggests the intelligence cycle process model does not sufficiently describe how the intelligence process works at the operational stages of domestic intelligence activities within the National Network. Within the USIC, however, the intelligence cycle process model appears to be an academic process conducted primarily by analysts and not operational intelligence collectors. As an example, in a doctoral dissertation written by Ms. Bridget Nolen on USIC information sharing and collaboration she noted "An analyst will sometimes write a paper on a self-generated topic, but much of the time the analyst is responding to a 'tasking,' which means that a policymaker has a specific question that he or she wants a subject matter expert to answer. The analyst drafts a response as quickly as possible by putting together the available information from a variety of classified and open sources, and must then begin the arduous coordination process to ensure that other analysts in the Intelligence Community concur with the assessment. After the paper is coordinated, it must then go through many more layers of editing through management, and then a final edit for style, structure, and formatting before it can be published—that is, delivered to policymakers."[45]

A critical juncture in the process identified by Nolen is coordination. This corresponds with the independent phase "production" or the joint phase "analysis and production" dependent on which intelligence cycle process model is being used. During this phase, it is noted "...each paper an analyst writes is considered a 'community' product...,so it is important that other experts vet an analyst's work before the policy

[45] Bridget Rose Nolen, *Information Sharing and Collaboration in the United States Intelligence Community: An Ethnographic Study of the National Counterterrorism Center* (PhD diss., University of Pennsylvania, 2013), 90.

maker reads it. At this theoretical level, coordination makes sense. In practice, however, the coordination process frequently transforms into a battle over turf, a venue for blatant backstabbing, and a practice rooted in nitpicking and meaningless editing...."[46] Another cogent example identifying the challenges of finished intelligence—the theoretical end result of a perfectly functioning intelligence cycle process model—is provided from an interview excerpt "NCTC has to coordinate with everyone. It is difficult when DHS thinks they can call the editors personally and hold your piece because they think it interferes with their business project. Like with terrorist documents—we might write about how terrorists exploit student visas, and well, State issues the student visas and they do not like the fact that we are criticizing the loopholes in their system. So they'll hold the piece or try to kill it."[47] These issues point out the practical challenges with employing the intelligence cycle process model within the USIC established in 1947, accordingly, similar challenges are present within the complex National Network and the HSE.

Author Leo D. Carl reference to the intelligence cycle as a five-step process in his 1990 *The International Dictionary of Intelligence* includes: 1) Planning and Direction, 2) Collection, 3) Processing, 4) Production, and 5) Dissemination.[48] Author Robert M. Clark in his 2004 *Intelligence Analysis: A Target-Centric Approach* describes the traditional intelligence cycle as a six-step process: 1) Requirements, needs, 2) Planning, direction, 3) Collection, 4) Processing, 5) Analysis, and 6) Dissemination.[49] Lastly, the Naval Postgraduate School Center for Homeland Defense and Security's Course NS4146 titled *Intelligence for Homeland Security*, by Dr. William Lahneman offers to a seven-step process: 1) Requirements, 2) Collection, 3) Process and Exploitation, 4) Analysis and Production, 5) Dissemination, 6) Consumption and 7) Feedback. The aforementioned

noting of intelligence cycle process models reveals the diverse number of models and aids in identifying the potential challenges with providing consistent training and adherence to the National Network and broader HSE.

The DHS HSAC cyclic process included a five-step intelligence cycle process: 1) Planning and Requirements Development, 2) Collection, 3) Analysis, 4) Dissemination, Tasking, and Archiving, and 5) Reevaluation.[50] This provides yet another version of the intelligence cycle process model.

The four figures below serve as diagrams illustrating the diversity of intelligence cycle process models, similar to the table provided in Chapter I. While there are minor but important differences, not one of the four is exactly alike, although each element is a member of the national intelligence architecture.

entities. It involves evaluating the profound differences between providing classified information to policymakers, such as during the Cold War, and providing homeland security intelligence and threat information to the private sector, public organizations and U.S. Citizens in a post-9/11 domestic intelligence environment.[55]

The 9/11 Commission Act, Section 511 provides DHS shall establish a DHS State, Local, and Regional Fusion Center Initiative necessary for establishing partnerships with state, local, and regional fusion centers; specifically Section (b) (11) mandates providing training to state, local, and regional fusion centers.[56] The DHS I&A concurred with the responsibility per Section 511 to develop training curricula on the intelligence cycle process for state and local officials.[57] In satisfying this mandate, DHS deployed intelligence officers charged with managing the intelligence cycle in their areas of responsibility.[58] While fusion center personnel receive DHS sponsored intelligence cycle training from a variety of federally funded institutions, this is not the case for a majority of public safety officials operating outside the National Network such as the MCCCIE initiative.

The Major Cities Chiefs Association, an organization comprised of police chiefs and sheriffs from 63 of the largest law enforcement agencies in the U.S., initiated the MCCCIE in 2011. Serving as a significant representative of the state and local criminal intelligence community, the MCCCIE's aim is to better integrate state and local criminal intelligence and counterterrorism operations in support of the National Network by addressing the deficiencies of standardizing integration and intelligence collection

practices within the state and local environment.[59] Figure 5 depicts a four-step Prediction-Led Policing Business Process Model that may be viewed in the context of the intelligence cycle process model. The Prediction-Led Policing Business Process Model is based on a concept established by the Center for Problem-Oriented Policing with the first two phases focusing on collecting and analyzing criminal information necessary for establishing predictions and the last two phases focus on response to the predictions.[60] The parallels between the intelligence cycle process model and the prediction-led policing process model is the critical need for information collection and analysis.

This critical segment of the HSE receives considerably less training on the intelligence cycle process model, although it oversees far more personnel than the National Network. There are questions law enforcement intelligence analysts use to ascertain a threat or the threat situation using the intelligence cycle process model that are not readily obvious to law enforcement investigators.[61] The contrasting perspectives associated with the intelligence cycle process model between law enforcement intelligence analysts and law enforcement investigators parallel the environmental setting within the USIC between intelligence analysts and operational intelligence collectors.

Figure 5. The Prediction-Led Policing Business Process Model, RAND RR233–1.1[62]

The terrorist events of 9/11 vastly transformed law enforcement communities across the U.S. and the approach to preventing and combating terrorism that focused on proactive posturing versus reactive engagement.[63] New transnational enemies possibly operating within the homeland in the form of international terrorists and transnational issues, such as narcotics and money laundering have risen in importance becoming more urgent than the previous Cold War era geopolitical concerns. As the intelligence and law enforcement communities have both become increasingly involved in the international aspects of terrorism, drug trafficking, and international organized crime, the National Network is positioned to access the USIC's considerable wealth of information on these subjects. However, in considering the fulfillment of these capabilities by the HSE, this issue has been the most difficult to resolve.[64]

The HSIE, through DHS I&A, authorizes intelligence collection activities that serve to support the National Network and the HSE in efforts to identify emerging homeland security threats. The DHS I&A intelligence collection efforts of DHS Intelligence Officers supporting the National Network was detailed in a July 29, 2008 DHS Memorandum. On April 3, 2008, DHS CINT Honorable Charles Allen under DHS Intelligence Oversight procedures defined homeland security threats to include "all threats or hazards, regardless of origin, that relate to: critical infrastructure or key resources; a significant public safety, public health or environmental impact; political, societal and economic infrastructure; border security; the proliferation or use of weapons of mass destruction; or other potential catastrophic events including man-made and natural disasters."[65]

An examination of literature provides general knowledge and reveals minimal discourse concerning the intelligence cycle process model employment within the context of domestic intelligence collection activities, specifically within the National Network. DHS and other entities continue to provide training and instruction on various intelligence cycle process models to the 78 state and major urban area fusion centers that embody the National Network.

Lowenthal proclaims one of the stated goals of the U.S. intelligence process (intelligence cycle) is to have "analysis-driven collection." A short hand way of recognizing that collection priorities should reflect the intelligence needs required to produce analysis.[66]

There are disagreements in literature as writer Arthur S. Hulnick, a professor at Boston University who served seven years as an U.S. Air Force Intelligence Officer and 28 years with the Central Intelligence Agency (CIA), claims the intelligence cycle is really not a very good description of the ways in which the intelligence process works and "the notion that policymakers or intelligence consumers provide guidance to

intelligence managers to begin the intelligence process is incorrect."[67] Robert Clark, a 42-year Intelligence Analyst, faculty member of the Intelligence and Security Academy and a professor of intelligence studies at the University of Maryland University College, likewise challenges the intelligence cycle process model's effectiveness and contends "intelligence is organized around the flawed concept of an intelligence cycle"[68] and "over the years the intelligence cycle has become somewhat of a theoretical concept…[and] when pressed many intelligence officers admit that the intelligence process 'really doesn't work like that.'"[69]

The evaluation of the intelligence cycle process model, based on the writers' presentation, suggest the theoretical intelligence cycle is a simple process beginning with customer needs and ending with providing a product that satisfies those needs. Inconsistencies with employing the intelligence cycle process model surface because of existing conflicts among intelligence and law enforcement analytic and operational components. With the inclusion of DHS into the USIC, along with state and local entities as key HSE elements, there exists an essential challenge—what intelligence process training should be provided to the National Network and HSE? In addition, is current intelligence cycle process training provided to the National Network and HSE appropriate and effective? Given literature overlooks a standardized intelligence cycle process model that does not exist. Furthermore, literature reflects significant historical abuses along with current events that illustrate challenges with domestic intelligence activities specifically collection.

Unlike at the federal-level within the USIC, the National Network made up of mainly law enforcement centric elements view the intelligence process from a different perspective. Prior to using the intelligence cycle as a business practice, state and local law enforcement integrated intelligence-led policing as the standard business practice for "analysis-driven collection." Law enforcement's acceptance of intelligence-led policing

[67] Arthur S. Hulnick, *What's Wrong with the Intelligence Cycle*. Intelligence and National Security 21. No. 6. December 2006. 959.

[68] Robert M. Clark, *Intelligence Analysis: A Target-Centric Approach* (Washington, D.C.: CQ Press), 2004. 12.

[69] Ibid., 15.

advanced the goal of developing a universal process that would integrate both law enforcement and national security intelligence agendas. The result was the intelligence cycle process model[70] although some have affirmed there are fundamental differences between national security and local law enforcement intelligence. The fundamental differences that exist between the law enforcement perspective and traditional intelligence community perspective, regarding intelligence collection, results in a less than effective intelligence platform within the homeland.[71]

In a September 2011 publication by the Intelligence and National Security Alliance titled *Intelligence to Protect the Homeland: Taking Stock Ten Years Later and Looking Ahead*, former FBI Executive Assistant Director for Intelligence Maureen Baginski, a former NSA senior intelligence official who headed the FBI Directorate of Intelligence created in 2005, claims that many federal intelligence and law enforcement professionals do not recognize the homeland security implications and intricacies of criminal information.[72] Jennifer Sims, a Senior Fellow for National Security at the Chicago Council on Global Affairs and a Visiting Professor in the Security Studies Program at Georgetown University along with Burton Gerber, a CIA Distinguished Intelligence Medal recipient and former 39-year CIA employee acknowledges, "[a] critical difference between law enforcement and traditional intelligence collection is that law enforcement gathers hard truth in the form of evidence; prosecutors and courts require this."

The intelligence collection phase under the intelligence cycle process model covers the gray area and makes estimations, which is what the consumer demands. The "gray area" centers on how to effectively perform domestic intelligence activities while employing the intelligence cycle process model among HSE members concurrently protecting privacy, civil liberties, and civil rights. Chapter III offers the historical and

post-9/11 challenges of domestic intelligence activities, specifically the collection phase of the intelligence cycle process model.

The HSE receives intelligence training from many organizations, such as DHS I&A, DOJ Bureau of Justice Assistance, MIPT, the Institute for Intergovernmental Research, as well as many academic institutions. When combining the many versions of the intelligence cycle process model and the various organizations providing intelligence training on one of its many versions to the HSE, the question surfaces as to its effective adherence.

D. HOMELAND SECURITY ENTERPRISE AND NATIONAL NETWORK INTELLIGENCE CYCLE TRAINING

The previous section of the literature review focused on defining key intelligence enterprises, the term "intelligence" within the USIC and law enforcement, and the intelligence cycle process and its many variations. This section of the literature review will focus on training the intelligence cycle within the HSE and National Network.

The analysis of limited information made available regarding HSE and National Network intelligence cycle employment reveals gaps concerning its effectiveness and appropriateness within the post-9/11 environment. The HSE and National Network receive training from federal, government sponsored and academic institutions on the intelligence cycle process model with an emphasis on enhancing domestic intelligence capabilities to prevent future terrorist attacks.

Providing structured training on the intelligence cycle process model should make the most of the HSE and National Network efforts to detect, neutralize, and exploit terrorist strategies and tactics. Well-trained analysts within the National Network are critical to efficient intelligence analysis. However, even with pristine data, a lack of strong analytics may result in less-than-desirable intelligence products and operational outcomes.

Additionally, employing the intelligence cycle process model within the National Network and the greater HSE have presented several concerns. Among privacy advocates, there are privacy concerns regarding collection of information on Americans

who have not violated the rule of law. Among policy makers, there are concerns regarding the proper collection of information in support of domestic intelligence activities among public and private HSE entities. Lastly, among scholars and practitioners, there are concerns the intelligence cycle process model may not serve as an effective analytic tradecraft competency in reducing strategic surprises associated with a threat, while simultaneously enhancing operational law enforcement and intelligence elements. The literature review did not provide standardized doctrinal information on the adoption of the intelligence cycle as a formal process by USIC, HSIE or HSE members. However, guiding principles such as EO 12333 (as amended), the 2006 Fusion Center Guidelines, and the TCL provided a common framework to introduce the intelligence cycle process model.

The DHS State and Local Program Office, in conjunction with the DHS Federal Emergency Management Agency (FEMA) and DOJ provides intelligence cycle training opportunities to the National Network and HSE via the DHS/DOJ Fusion Process Technical Assistance Program and Services, the FEMA sponsored MIPT. There are a number of academic institutions that also provide intelligence cycle training, most notably the Naval Postgraduate School's Center for Homeland Defense and Security and the Michigan State University. The author and academic David Carter with Michigan State University developed a local intelligence guide titled *Law Enforcement Intelligence: A Guide for State, Local, and Tribal Law Enforcement Agencies* highlighting the need for a different approach to the intelligence cycle at federal level when compared to state, local, tribal and territorial level based on different intelligence demands.[73]

Literature clearly agrees that the intelligence cycle is used as the traditional intelligence process at the federal level within the USIC. Because of the federal government's support to the state and local environment via the National Network, DHS provides instruction on the intelligence cycle process to state and local officials within

[73] David L. Carter, U.S. Department of Justice, Office of Community Oriented Policing Services, *Law Enforcement Intelligence: A Guide for State, Local, and Tribal Law Enforcement Agencies*, 2nd ed., January 2009, 14.

the National Network and limited HSE elements. As highlighted by author David Carter, there is a cultural contradiction that exists in traditional law enforcement notwithstanding the recent focus on the intelligence-led policing (ILP) model that focuses on identifying criminal behavior, reporting criminal activity and preventing future crimes based on trends and patterns.

Mr. Carter acknowledges the private sector is often a legitimate consumer of law enforcement intelligence meeting the "right to know" and "need to know" in support of information sharing standards. Similar to the majority 18,000 U.S. law enforcement agencies, the private sector as a significant element of the HSE that owns an estimated 85 percent of the nation's critical infrastructure is generally not slated to receive federally funded intelligence cycle process training. Moreover, the private sector has a large personnel force who, if given the proper information, can significantly increase the "eyes and ears" on the street to observe individuals and behaviors that pose threats. However, there are information sharing issues that need to be resolved. For example, certain types of personal information may be inappropriate for law enforcement to release to the private sector. Conversely, proprietary information related to corporate products may also be restricted. Despite these limitations, there is a legitimate intelligence role for the private sector.[74]

Mr. David Cid, MIPT Executive Director, similarly recognizes the law enforcement cultural contradiction to intelligence and asserts avoiding strategic surprise is a principle function of intelligence that allows law enforcement to be anticipatory and proactive in efforts to prevent potential terrorist attacks. However, traditional measures of success in law enforcement, such as arrests, indictments, and seizures of property are secondary to prevention.[75]

Common themes within the literature advances intelligence cycle models as a key element of the USIC. The literature also reveals disagreements about its effectiveness at

[74] David L. Carter, White paper, *The Intelligence Fusion Process for State, Local and Tribal Law Enforcement*, Michigan State University, May 2006, accessed March 3, 2013, http://www.ncirc.gov/documents/public/intelligence_fusion_process.pdf, 7.

[75] David Cid, *Understanding Counterterrorism: A Guide for Law Enforcement Policy Makers and Media*, 2012, 264, 268.

the practitioner level, as well as its many variations based on organizational mission space. Finally, the literature overlooks or perhaps shortchanges the question of whether the intelligence cycle process model is effective or appropriate within the HSE and the National Network, while revealing the challenges of domestic intelligence collection, which will be focus of the following chapter.

THIS PAGE INTENTIONALLY LEFT BLANK

III. DOMESTIC INTELLIGENCE AND EMPLOYING THE INTELLIGENCE CYCLE PROCESS MODEL

> We also have no official with sole and comprehensive responsibility for domestic intelligence. It is no surprise that gaps in domestic intelligence are being filled by ad hoc initiatives.
>
> – Judge Richard Posner, U.S. Court of Appeals

The focus of this thesis provides an academic inquiry into the intelligence cycle process adherence within the National Network and the greater HSE. The information contained in this publication may reflect the intelligence cycle process as an idealistic model while highlighting the challenges of adopting a standardized intelligence cycle process acceptable among homeland security professionals. Chapter III is intended to offer illustrations relevant to the challenges of executing domestic intelligence activities. The central points are identifying the national security focus of domestic intelligence policies, the exploitation of domestic intelligence authorities, and cultural differences between the USIC and elements of the HSE that effect the employment of the intelligence cycle process model.

A. DOMESTIC INTELLIGENCE ACTIVITIES – NATIONAL SECURITY FOCUS

The USIC, established by the 1947 National Security Act because of World War II, differs in many ways from its present structure. The 1947 National Security Act established a national effort to protect the U.S. from foreign actors in response to the Japanese attack on Pearl Harbor and the subsequent Cold War with the Soviet Union. As a result of the terrorist acts committed on September 11, 2001, the USIC changed to introduce two new members of the USIC; the DNI; and DHS I&A. The 9/11 attacks on the U.S. served as a motivator for yet another national effort to protect the U.S. from both foreign terrorists operating abroad and within U.S. borders. A national policy or doctrine

regarding a standard intelligence process is critical, since professional intelligence officers often think of their primary mission of information collection and analysis in terms of an "intelligence cycle."[76]

Historically, America has responded to the need for domestic intelligence in four ways. First, avoid it. There was less than a page-sized narrative devoted to intelligence in the 2002 National Strategy for Homeland Security. Second, construct ad-hoc arrangements without clear oversight and authority, which led to political abuse in the 1975 Church Commission Report. Third, allow the FBI and CIA to perform limited and highly scrutinized overt domestic intelligence collection activities per EO 12333. Fourth, assume the law enforcement community can substitute for intelligence.[77]

The National Network assumed a key role to address counterterrorism threat information sharing and intelligence analysis at the state and local level. The annual Fusion Center Assessments, a critical component of a broader Fusion Center Performance Program, is designed to measure pre-determined baseline capabilities and holistic performance of the National Network[78] fulfilling the shortcomings identified in the 2010 DHS BUR.

The DHS, in coordination with interagency partners, Fusion Center Directors, and other fusion center stakeholders, manages the annual assessment process that focuses primarily on measuring four COCs,[79] which contain elements of the intelligence cycle process model – collection, analysis, production, and dissemination. The 78 fusion centers that constitute the National Network completed the 2011 and 2012 Fusion Center Assessments allowing DHS to collect data necessary for measuring their progress in achieving baseline capabilities that include the COCs as key performance objectives within the National Network.

[79] Ibid.

The first COC-1 is *receive*; the ability to receive classified and unclassified information from federal partners.[80] The second COC-2 is *analyze*; the ability to assess local implications of threat information using a formal risk assessment process.[81] The third COC-3 is *disseminate*; the ability to further disseminate threat information to other state, local, tribal, and territorial entities within their jurisdictions.[82] And lastly, the fourth COC-4 is *gather*; the ability to gather locally generated information, aggregate it, analyze it, and share it with federal partners as appropriate.[83] The COCs 1 and 4 are viewed in context of the intelligence cycle process model pertaining to "collection" and places emphasis on the vertical flow of information among federal agencies and state, local, tribal, territorial, and private sector partners. As previously mentioned and reflected in Figure 1, the single common attribute within the various intelligence cycle models is the "collection" phase. Chapter III of this thesis offers noted historical and current challenges to executing domestic intelligence activities under the collection phase of the intelligence cycle process model, a continuing concern for privacy advocates. The COCs 2 and 3 are logical sequenced actions of the intelligence cycle process model that are utterly contingent on the National Network's ability to fully execute the complete intelligence cycle process.

External to the National Network, DHS in close partnership with state and local partners developed the Target Capabilities List for general public safety officials, excluding law enforcement. The TCL describes the preparedness capabilities related to the four homeland security mission areas: Prevent, Protect, Respond, and Recover. The TCL identified critical elements of the intelligence cycle process model involved with gathering [collection], analysis, production and dissemination that states and localities should possess in order to prevent, protect, respond and recover from a terrorist incident. It defines and provides the basis for assessing preparedness of which include information gathering (collection), intelligence analysis and production as elements of the Prevent

Mission Capabilities. In 2009, the Heritage Foundation,[84] which is a conservative think tank whose mission is to formulate and promote conservative public policy, emphasized the significance of state and local capabilities in understanding the threat environment reported in a article titled *Effective Counterterrorism: State and Local Capabilities Trump Federal Policy*.

B. DOMESTIC INTELLIGENCE POLICY

The 2002 Homeland Security Act established DHS I&A, which was later amended by the 2007 Implementing Recommendations of the 911 Commission Act that established the DHS I&A State and Local Program Office. Both pieces of legislation created an organization designed to address the issues of information sharing to protect the homeland and partnering with state, local, tribal, territorial and private sector elements to ensure not only horizontal and vertical information sharing but also to leverage the HSE as contributors to the national intelligence architecture. Effective information sharing and the expansion of USIC capabilities is intended serve a more comprehensive approach in supporting the national efforts to protect the U.S. from future terrorist attacks.

The 2004 Intelligence Reform and Terrorism Prevention Act (IRTPA), signed into law by President Bush made major amendments to the 1947 National Security Act and reintroduced the "…idea of a Director of National Intelligence (DNI) [that] dates to 1955 when a blue-ribbon study [was] commissioned by Congress. It was the attacks of September 11, however, that finally moved forward the longstanding call for major intelligence reform and the creation of a Director of National Intelligence."[85] As noted in Chapter II, EO 12333 sets forth the foundation of the USIC and the Administration's

[84] The Heritage Foundation, accessed June 7, 2013, http://www.heritage.org/about.

[85] Office of the Director of National Intelligence, accessed August 5, 2013, http://www.dni.gov/index.php/about/history.

directions regarding "timely and accurate information about the activities, capabilities, plans, and intentions of foreign powers, organizations, and persons and their agents"[86] in support of national security.

An EO serves as an official document to manage the operations of the federal government.[87] However, when EO 13470 in 2008 amended EO 12333, it included language focused on the responsibility of state, local and tribal governments, as well as the private sector to support U.S. intelligence activities. In order to support state, local and tribal governments, as well as the private sector integration into the HSE and support U.S. intelligence activities, DHS I&A, as well as other federal and academic elements, began delivering intelligence cycle process model training to the National Network and HSE.

The single common attribute used by various USIC intelligence cycle models is the "collection" phase. Nonetheless, the intelligence collection phase under the intelligence cycle process model within the post-9/11 HSE is considered a gray area because information is often required or expected from activities that are not necessarily violations of law, yet the information may be collected for the purpose of predictive analytic assessments for law enforcement and homeland security professionals. In 1952, intelligence "collection" was defined as the procuring, assembling and organizing of information and served as the first step in the processing of intelligence information according to *The International Dictionary of Intelligence* published by author Leo D. Carl. Today, it is considered the third step or phase in the intelligence cycle and "officially defined as 'the exploitation of sources of information by collection agencies and delivery of information to the proper intelligence-processing unit for use in the production of intelligence.'"[88] The 1952 definition was geared toward intelligence collection targeted against communist nation-states of the former Soviet Union and not the domestic intelligence environment of today.

[87] Ibid.

[88] Leo D. Carl, *The International Dictionary of Intelligence* (McLean, VA. International Defense Consulting Service, 1990). 59.

The September 11 terrorist attacks raised serious concerns regarding the sufficiency of the USIC intelligence collection capabilities and facilitated state, local, tribal and private sector partner assimilation into the newly established homeland security enterprise. The nation began focusing its intelligence collection efforts in order to prevent future attacks through the development of multiple national strategies between the White House and the DNI with minimal attention to domestic intelligence collection. The White House produced the 2002 National Security Strategy, the 2007 National Strategy for Homeland Security, and the 2010 National Security Strategy of the United States, the 2011 National Counterterrorism Strategy, and most recently the 2012 National Strategy for Information Sharing and Safeguarding. The DNI produced the 2005 National Intelligence Strategy and the 2009 National Counterintelligence Strategy. The first National Homeland Security Strategy published by the Bush administration in 2002 documented "Homeland security is based on the principle of shared responsibility and partnership with "state and local governments, the private sector, and the American people."[89] However, within the 2002 national strategy, there is no specific mention of domestic intelligence collection,[90] which remains consistent among the other referenced strategies.

Executive Order (EO) 12333 provides guidance for U.S. intelligence activities among USIC members, but it lacks a specific doctrine or "how to" concerning domestic intelligence collection to prevent repeating the law enforcement and intelligence mishaps of the past. The lack of doctrine may accelerate intelligence mishaps given the explicit language of Part 1.4 of EO 12333 that integrates state, local, and tribal governments, as well as private sector entities.

> [T]he Intelligence Community shall collect and provide information in accordance with priorities set by the President concerning activities to protect against international terrorism, proliferation of weapons of mass destruction, intelligence activities directed against the United States, international criminal drug activities, and other hostile activities directed against the United States by foreign powers, organizations, persons, and

> their agents as well as take into account information needs relating to national and homeland security provided by state, local, and tribal governments and private sector entities.[91]

The federal government concentrates its support to nontraditional intelligence collectors (state, local, and tribal governments, as well as private sector entities) via the National Network. The National Network is a far-reaching change from the USIC that existed originally as part of a massive response to the challenge from the Axis powers in World War II and charged with responding to the challenges associated with the spread of Communism and the military might of the Soviet Union.

Most fusion centers within the National Network are law enforcement centric and recently integrated the Intelligence-Led Policing (ILP) model as the standard intelligence business practice. The term "Intelligence-led Policing" was coined in Great Britain to focus on key criminal activities[92] and its general philosophy was adopted by IACP in the March 2002 Intelligence Summit.[93] Author and academic David Carter, stated the emergence of ILP significantly enhances the law enforcement intelligence function.[94] However, as law enforcement agencies wrestle with the understanding of their new role in collecting and analyzing intelligence in support of the national intelligence architecture while at the same time managing crime in their jurisdictions, some authors judge introduction of ILP in the U.S. has been problematic.[95] Few agencies engage in proper intelligence-led techniques and ILP cannot be implemented effectively, if officers and analysts are not trained in the intelligence cycle process model in order to prevent crime

and terrorism.[96] According to the 2012 National Network of Fusion Centers Final Report, 100 percent of the National Network reported conducting or contributing to threat assessments, primarily focused on consequence, risk or vulnerability analysis[97] juxtapose proactively identifying threats supporting intelligence-led law enforcement activities necessary for preventing crime and terrorism. Purportedly, only 41 of 78 fusion centers (53.2 percent) contributed to national-level assessments, a statistic unchanged from the 2011 Assessment.

The International Association of Law Enforcement Intelligence Analyst (IALEIA), an organization established in 1980 to advance law enforcement intelligence analytic standards, defines ILP as "executive implementation of the intelligence cycle to support proactive decision making for resources allocation and crime prevention."[98] A consensus on the interpretation of the ILP philosophy between IACP and IALEIA has not been reached relative to standard employment of the intelligence cycle process model.

C. EXPLOITING DOMESTIC INTELLIGENCE AUTHORITIES – ABUSES

Expanding domestic intelligence capabilities initially began in the early part of the 20th century under President Theodore Roosevelt's administration.[99] Thirty-plus years prior to 9/11, challenges with domestic intelligence collection were uncovered during the 1970s Watergate, Rockefeller, Church, and Pike Investigations. The investigations involved overreach into U.S. domestic intelligence by the USIC and

improper domestic intelligence activities by the Law Enforcement Community.[100] However, September 11, 2001, once again initiated the demand for increased domestic intelligence collection.

Domestic intelligence abuses may be viewed from two perspectives, political and multicultural. During the 1970s, the main topic of interest underlying the perceived threat to U.S. social structures centered on preventing the spread of communism by addressing perceived Soviet Union influence of social issues. In the post-9/11 environment, the topic centers on identifying the terrorist threat residing within the U.S. from groups or individuals aligned with radical violent and extremist ideology.

D. USIC MEMBERS – FBI, CIA, AND DOD/NSA

Members of the USIC, most notably the FBI and the CIA, as well as local law enforcement, conducted improper domestic intelligence collection activities under two programs. The FBI Counterintelligence Program known as COINTELPRO is well known for its domestic intelligence collection overreaches. The Center for National Security Studies,[101] a civil liberties think-tank founded in 1974 to prevent violations of civil liberties in the U.S., published several articles on COINTELPRO. Another grim domestic intelligence overreach involved the CIA's Operation CHAOS.[102]

Seymour Hersh in the New York Times first exposed the CIA's domestic operations on December 22, 1974. As a result, President Ford established the Rockefeller Commission to look into the CIA's domestic intelligence activities. The Rockefeller Commission detailed the CIA's mail intercept program described a separate domestic spying program run by the CIA's Office of Security called Project Resistance and

[101] The Center for National Security Studies serves as a watchdog in defense of civil liberties, human rights and constitutional limits on government power. Policymakers, opinion leaders and journalists regularly seek the Center's expertise on both substantive and strategic issues, accessed August 5, 2013, http://www.cnss.org/pages/mission.html.

[102] Verne Lyon, *Domestic Surveillance: The History of Operation CHAOS*, accessed March 5, 2013, http://www.serendipity.li/cia/lyon.html.

mentioned an Office of Security program that gave seminars and training on lock-picking and surveillance to a number of local police departments.

The CIA's Operation CHAOS was designed to infiltrate American student organizations opposed to the Vietnam War to determine if there were foreign links.[103] The CIA Operation CHAOS existed for 5 years beginning in 1967 and ending in 1972, according to the Rockefeller report that revealed a compilation of some 13,000 different files, including files on 7,200 American citizens. However, the numbers may be on the low side; Operation CHAOS was tightly compartmented within the CIA and free from periodic internal review. For example, later reports of the number of state, local, and county police departments assisted by the CIA were put at 44, which is far more than the handful mentioned in the Rockefeller report.

The problems of collection guidance were the subject of a number of special studies to include the CIA's Inspector General in 1966 (known as the Cunningham Report).[104] In wake of revelations that the CIA had violated its charter by spying on U.S. citizens, a series of congressional investigations concluded there were violations of the law, as well as discovery of much wider range of intelligence investigation abuses.[105]

During the same period as CIA's Operation CHAOS, the FBI's COINTELPRO levied intelligence requirements on the CIA to collect information on U.S. citizens traveling abroad.[106] The FBI, established in 1908, was initially designated primarily as a law enforcement agency. However, under President Roosevelt's administration and because of World War II, the FBI's responsibilities expanded to include centralizing the authority for domestic intelligence.[107] Although originally created to investigate specific federal crimes, the FBI expanded into the notorious Hoover-era domestic intelligence

[107] Ibid., 112.

agency that was famous for excess and overreach. Revelations of Hoover-era abuses prompted the FBI to refocus for a time on crime solving and a season of robust oversight and operational limitations on intelligence gathering followed. These limits were set forth in an internal set of rules, known since their creation as the "Attorney General's Guidelines."[108] The organizational setback is still a concern with the American public and civil liberties organizations. Because of 9/11, the Attorney General's Guidelines have once again undergone changes and currently it is titled the *Domestic Intelligence Operations Guide*. Thus, while the FBI has conducted investigations for both law enforcement and intelligence purposes throughout its history, their intelligence-collection activities prompt the most frequent calls for reform.[109]

During combat operations in Vietnam, U.S. Army intelligence agents gathered information on anti-war activists in support of the potential use of federal troops in the case of civil disturbances or urban riots. When the U.S. Army's domestic intelligence program became public knowledge in 1970 the public and political backlash caused a sever reduction at the end of the Vietnam War at perceived abuses.[110] The NSA, a DoD element recently came under public scrutiny concerning domestic intelligence collection activities. In the wake of leaks by former NSA contractor Edward Snowden, U.S. officials have faced growing questions about the kinds of information they are collecting about Americans, at what scale and under what authority. Intelligence officials reported collection efforts are important counterterrorism measures. Similar to the current privacy concerns regarding domestic intelligence collection activities by the FBI and the National Network, NSA has ties to past domestic intelligence collection abuses. The NSA created Project MINARET in 1969 to spy on peace groups and black power organizations. Federal agencies requested NSA to survey international communications of certain U.S. citizens traveling to Cuba. Beginning in 1967, requesting agencies provided names of U.S. persons in an effort to determine foreign influence on civil disturbances occurring

throughout the Nation and later, the widespread national concern over criminal activity such as drug trafficking and acts of terrorism, both domestic and international.[111]

The activities were likely a result of the lack of specific legislative and organizational guidance or doctrine regarding domestic intelligence collection. The U.S. intelligence collection array was largely built to respond to the difficulties of penetrating the Soviet target.[112] However, as the literature review highlights, when the collection phase on the USIC intelligence cycle is directed to support domestic intelligence, it has proved to be a detriment to civil rights without sound doctrine.

E. LOCAL LAW ENFORCEMENT

As early as the 1920s, law enforcement intelligence units maintained "dossier" files on individuals thought to be involved in some form with criminal activity, and in the 1950s, such files were maintained on individuals due to their political expressions or their placement on the fringes of mainstream society. Because of these files, the U.S. Supreme Court under Chief Justice Earl Warren ruled state or local law enforcement might be subject to civil liability.

This ruling commonly referred to as the "1983 suits" relied on a provision of the 1871 Civil Rights Act, codified as U.S. Code Title 42, Section 1983 – Civil Action for Deprivation of Rights. In the 1960s and early 1970s, lawsuits under the "1983 suits" targeting police intelligence units provided an individual could hold state and local law enforcement departments and their officers liable for maintaining records on individuals with no evidence of a crime.[113] Given a history in the 1960s and 1970s in which police

intelligence units all too often violated citizen groups' First Amendment rights, there was a widespread movement to dismantle such capabilities.[114]

The NCISP drafted by the Global Justice Information Sharing Initiative Intelligence Working Group served to provide a model for intelligence process principles and policies by law enforcement elements. A key element of the NCISP supports policies that will protect privacy and constitutional rights while not hindering the intelligence process. As an example, the NCISP states a "privacy policy should stress the need for and importance of planning and direction (the first stage of the intelligence process). Although it is only one phase of the intelligence cycle, planning and direction guides the overall activities of the criminal intelligence function."[115]

F. NATIONAL NETWORK OF FUSION CENTERS

The National Network is susceptible to encountering like challenges with executing domestic intelligence activities. In December 2007, the American Civil Liberties Union (ACLU) published an article titled *What's Wrong With Fusion Centers?*" in which authors Michael German, ACLU Senior Policy Counsel and former FBI Supervisory Special Agent and Jay Stanley, an ACLU Senior Policy Analyst claims there has not been adequate public discourse regarding the National Network establishment prior to opening a state or major urban area fusion center charged with collection and sharing of intelligence information, specifically about American citizens and other residents. The article emphasizes civil rights abuses of the past by federal and local law enforcement and intelligence organizations while concluding like actions could potentially occur again without the proper legislative oversight and adequate checks and balances to monitor their operations.

The ACLU provided examples of a number of troubling intelligence products produced by fusion centers that were leaked to the public, such as a Texas fusion center

[114] Timothy Connors, and John Rollins, Center for Policing Terrorism at the Manhattan Institute. *State Fusion Center Processes and Procedures: Best Practices and Recommendations*. Policing Terrorism Report, No. 2, September 2007, 3.

[115] U.S. Department of Justice, Global Justice Information Sharing Initiative, *National Criminal Intelligence Sharing Plan*, October 2003, 12.

that released an intelligence bulletin describing a purported conspiracy between Muslim civil rights organizations, lobbying groups, the Iraq anti-war movement, a former U.S. Congresswoman, the U.S. Treasury Department and hip hop bands to spread Sharia law in the U.S. A Virginia Fusion Center reportedly issued a terrorism threat assessment describing the state's universities and colleges as "nodes for radicalization" and characterized the "diversity" surrounding a Virginia military base and the state's "historically black" colleges as possible threats.[116]

G. DOMESTIC INTELLIGENCE - CULTURE

As a result of the September 11 terrorist attacks, the 2001 Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism Act also known as the USA PATRIOT Act, allowed greater latitude in domestic intelligence/law enforcement collection activities.[117] The USA PATRIOT Act represents a decision on the part of the president and Congress that the nation expects its defenders to be proactive against terrorism of all kinds.[118] In support of the proactive nature to defend the nation, DHS I&A has the responsibility per Section 503 of the 9/11 Commission Act to develop training curricula on the intelligence cycle process model for state and local officials[119] via the National Network in an effort to predict emerging threats.

In order to fully execute the USIC intelligence cycle process model, information fusion as an immediate and long-term strategic capability must be continually built upon to perform carefully informed analysis and assessments of homeland security information. In order to achieve such a capability, government agencies and organizations must have timely and appropriate access to information that supports the "collection" phase of the intelligence cycle process model. This remains a challenge

[116] American Civil Liberties Union, accessed August 7, 2013, http://www.aclu.org/spy-files/more-about-fusion-centers.

[119] U.S. Department of Homeland Security, *DHS' Role in State and Local Fusion Centers is Evolving*. Office of Inspector General Report – OIG-09–12. October 2008, 16.

within the HSIE, specifically DHS I&A, as reflected in the DOJ Opinion of 28 Code of Federal Regulations, Part 23 specifically pertaining to DHS I&A. The opinion revealed;

> It has been brought to [DOJ] attention that some elements of the law intelligence information (which may include 'law enforcement sensitive' information) with the Department of Homeland Security (DHS), based upon a concern that it is not a 'law enforcement activity.' DOJ has consistently advised that the term does not require that an agency have law enforcement or investigative authority in order to qualify under an intelligence project's 'need to know' and 'right to know' criteria. Based on the description above, it appears that DHS, in performing its function of gathering information needed to protect the nation from foreign or domestic terrorist activity, is engaged in a 'law enforcement activity' and accordingly may be given access to criminal intelligence information that may be needed to properly carry out that function.[120]

The challenges with fusing information have been identified within HSIE as well as the HSE. The 2007 National Strategy for Homeland Security reported under the heading *Challenges in Homeland Security and Beyond* "although we have substantially improved our cooperation and partnership among all levels of government, private and nonprofit sectors, communities, and individual citizens, we must continue to strengthen efforts to achieve full unity of effort through a stronger and further integrated national approach to homeland security. Our information sharing capabilities have improved significantly, but substantial obstacles remain. We must continue to break down information barriers among federal, state, local and tribal partners and the private sector."[121]

In early August 2010, President Obama signed EO 13549 titled *Classified National Security Information Programs for State, Local, Tribal, and Private Sector (SLTPS) Entities*. This represented a significant step forward to facilitate classified intelligence and homeland security-related information sharing with SLTPS partners; to include putting in place a governance and oversight structure that would serve to ensure the uniform application of security standards within the executive branch and SLTPS

[120] U.S. Department of Justice Memorandum, *28 Code of Federal Regulations, Part 23*, March 31, 2005.

[121] The White House, *National Strategy for Homeland Security*, Washington: The White House, October 2007.

communities while maintaining consistency with existing policy and standards. This action now allowed classified information originating outside of DHS, and not otherwise covered by specific memorandum of understandings, to be disseminated by DHS to appropriately cleared nonfederal recipients in the National Network.

However, the policy and associated information sharing strategies often set forth by Washington are not readily accepted as they promulgate outside Washington, DC. In a professional environment, the writer observed and experienced unsuccessful intelligence and information sharing between SLTPS nontraditional intelligence recipients and federal HSIE and USIC entities because of differing organizational cultures. Due to the typical law enforcement culture and "lead-agency" law enforcement concept, the sharing of information with nontraditional law enforcement partners and the private sector remains a challenge. The October 2010 DHS Office of Inspector General Report emphasized this premise when it reported, "despite the overall improvements, DHS continues to face several information sharing challenges. Specifically, DHS component collaboration in the information sharing process needs improvement. In addition, unfinished intelligence products have not always been timely, and the production process for finished intelligence products should allow for more fusion center collaboration."[122]

The intelligence cycle process model collection phase depends on effective information sharing in order to produce value-added finished intelligence products for HSE policy and decision makers. With the expansion of USIC capabilities via SLTPS partners in support of the national intelligence effort, it is difficult to evaluate its effectiveness of the intelligence cycle process model in context of the lack of consistent intelligence cycle training and employment. Ms. Lisa Palmieri, a current DHS I&A Senior Intelligence Officer and former President of the International Association of Law Enforcement Intelligence Analysts, suggests the analysis phase of the intelligence cycle process model is problematic given the confusion between the terms intelligence and information among law enforcement officials as well as "…agencies employment of so-

[122] U.S. Department of Homeland Security, *Information Sharing with Fusion Centers Has Improved, but Information System Challenges Remain*, Office of Inspector General Report 11–04, October 2010.

called analysts who were either unaware of or untrained in analysis and who were merely collecting and disseminating raw data."[123]

Mr. Matt Mayer, counselor to the Secretary and Acting Executive Director for the Office of Grants and Training in DHS, visiting fellow at The Heritage Foundation, and President of the Buckeye Institute for Public Policy Solutions in Columbus, Ohio and Mr. Scott Erickson, who has studied and written on the proliferation of homegrown terrorism and the response by domestic law enforcement have specifically addressed the need for reform within the law enforcement culture in order to properly support their new counterterrorism role. Both assert that "uniformity of training must be a central aspect of any comprehensive shift in the domestic law enforcement culture" and "maintaining a mixed counterterrorism training regime [that includes the application of intelligence analysis] across the nation's 18,000 law enforcement agencies will inhibit the adoption of consistent and uniform standards for counterterrorism recognition and awareness." Symmetrical and uniform training standards would benefit the broader law enforcement community, as well as the public at large, by ensuring a consistent understanding of the threat of terrorism.[124]

IV. INTELLIGENCE CYCLE PROCESS MODEL CASE STUDY – BOSTON MARATHON BOMBING

> No one can comprehend what goes on under the sun. Despite all their efforts to search it out, no one can discover its meaning. Even if the wise claim they know, they cannot really comprehend it. Ecclesiastes 8:17

A. INTRODUCTION

In an evaluation of performance metrics known as COCs for the National Network, the TCL for non-law enforcement elements, such as emergency managers, and the MCCCIE for the law enforcement community, this thesis intends to ascertain adherence to the intelligence cycle process model. To better understand the intelligence cycle process model's general effectiveness, the thesis examines existing public data made available to the author of the 2013 Boston Marathon bombing with respect to the National Network and HSE. Information made available regarding the 2013 Boston Marathon bombing will attempt to illuminate whether the National Network or the HSE adhered to the intelligence cycle process model in order to forecast or prevent the terrorist act.

The Boston Marathon bombing once again raised similar questions that surfaced after the September 11, 2001 terrorist attacks regarding law enforcement officials and intelligence analysts' ability to identify a potential terrorist attack. The Boston Marathon bombing serves as a platform to discuss the effective employment of the intelligence cycle process model by the National Network, and why it did not prevent the Boston bombing. This associated case study is intended to underscore key issues associated with employing the intelligence cycle process model at the state and local level by demonstrating its effectiveness prior to, during, and after the April 15, 2013, Boston Marathon bombing as an appropriate HSE intelligence process model. It is not focused on identifying possible solutions and providing potential courses of action. The case study framework and lessons learned from the Boston Marathon bombing may be useful to HSE agencies in developing and supporting intelligence processes suitable for the National Network. The information sources gathered for this case study were acquired

from public discussion of the issue in Congress, court documents, the press media and statements of senior state and local officials.

This case study uses the April 15, 2013, Boston Marathon bombing in the context of the intelligence cycle process model adherence necessary to detect the threat and provide intelligence to policy and decision makers with information in order to prevent the bombing. Additionally, the case study highlights the challenges with implementing the intelligence cycle process model within the National Network while ensuring security and safety from both domestic and international terrorism. Literature has highlighted the challenges with the intelligence cycle process model within the U.S. intelligence community, as well as the HSIE and HSE, and how difficult it is to lead a successful intelligence process to the point that a value-added intelligence product is produced with sufficient content and consensus to be useful to the organizations tasked to develop it. This is especially true in a National Network that lack the mature culture and uniform repeatable processes generally employed by organizations like those that comprise the 17-member USIC. Nonetheless, intelligence as an entity, process, and product within the HSE has the critical mission of preventing future terrorist attacks.

Using the intelligence cycle process model domestically to support the HSE in an attempt to think ahead and to understand what is going to happen in the future has reopened old wounds associated with abuse of power by law enforcement and intelligence entities. Instead of having to focus on domestic intelligence collection in an effort to identify state actors of foreign intelligence and security services as a result of Cold War labors, it is now necessary that intelligence collection must expand beyond the traditional USIC members in order to defeat terrorism and transnational criminal organization threats in a post-9/11 environment.

The National Network was another safeguard developed across the country since 9/11 to support the national intelligence architecture and prevent future terrorist attacks. They were expressly created to make sure law-enforcement agencies shared terrorist-related information developed by federal, state, and local law enforcement agencies. “It highlights a concern that we have and the need for agencies to share data on the subjects that they are investigating,” said Mike Sena, president of the National Fusion Center

Association.[125] DHS estimates it has pumped $1.4 billion into state and local fusion centers in their effort to support the National Network and assist with sharing intelligence and treat information necessary to prevent terror attacks across the country.[126]

The implementation of the intelligence cycle process model within the USIC, HSIE and HSE in order to determine its effectiveness has received mixed reviews. Given these interpretations, the Boston Marathon bombing will be used to assess the effectiveness of a six-step intelligence cycle process that embraces *Intelligence Analysis: A Target-Centric Approach* published in 2004 by author Robert M. Clark: 1) Requirements, needs, 2) Planning, direction, 3) Collection, 4) Processing, 5) Analysis, and 6) Dissemination.[127]

B. SCENARIO

On April 15, 2013, at 2:49 p.m. Eastern Standard Time, two pressure cooker bombs exploded during the Boston Marathon killing three people and injuring 264 others.

The suspects were identified later that day as Dzhokar and Tamerlan Tsarnaev.[128] Tamerlan Tsarnaev was subsequently killed by law enforcement, but Dzhokhar Tsarnaev while injured was able to escape. On April 19, 2013, during an unprecedented manhunt by thousands of law enforcement officers, Dzhokhar Tsarnaev was later captured and arrested.

C. PHASE 1 – REQUIREMENTS/NEEDS

The beginning of the intelligence cycle process model is identifying information needs/requirements from a defined customer base with the intent of providing the right

intelligence product to the right end user to prevent future terrorist attacks. Homeland Security Standing Information Needs (HSEC SINs) form the foundation for information collection activities within the National Network to focus their collection, analytic, and reporting assets in support of the homeland security mission.[129]

There existed HSEC SINs made available to the National Network and the HSIE to identify and document information needs designed to prevent the Boston Marathon bombing. Additionally, in 2004 DHS issued a warning regarding explosive devices hidden in pressure cookers.[130] Likewise, according to a July 2007 National Intelligence Estimate entitled *The Terrorist Threat to the U.S. Homeland* an attack like the Boston bombing has been a concern for the U.S. government for years.[131] The DHS warning indicated pressure cooker bombs was as "a technique commonly taught in Afghan terrorist training camps."[132]

The Boston Regional Intelligence Center and the Commonwealth Fusion Center in Maynard,[133] which were designed to serve as clearinghouses for information about potential threats, were unaware that the FBI interviewed Tsarnaev as part of a three-month investigation after Russian agents alerted U.S. officials to his increasing radicalization, officials said.[134] Nor was information about Tsarnaev shared at the quarterly meetings the FBI had with local law enforcement leaders because according to

[133] The Boston Regional Intelligence Center and the Commonwealth Fusion Center of Maynard are elements of the National Network of Fusion Centers (National Network).

[134] Boston Globe, *FBI did not alert state's anti-terror unit to its probe of suspected bomber in 2011*, accessed June 10, 2013, http://www.boston.com/politicalintelligence/2013/04/25/fbi-did-not-alert-state-anti-terror-unit-its-probe-suspected-bomber/RLHZM6GHRotZ6ciIYxmiKP/story.html.

the FBI, it did not rise to a specific level of concern.[135] "We were not privy to the tip,'' said David Procopio, the spokesman for the Massachusetts State Police, which oversees the Fusion Center, "They didn't share that information with us."[136]

The numbers of HSE nontraditional intelligence recipients are vast, including the 78 fusion centers that make up the National Network. Due to the enormous number of executives charged with establishing and implementing intelligence policy, two challenges are immediately discovered; who determines the requirement to have access to intelligence and information together with identifying who shoulders the responsibility of approving and establishing the priorities for satisfying documented intelligence needs. The National Network is unlike the USIC that can be task members to collect, analyze and produce national intelligence products by Intelligence Community Directives and Intelligence Community Policy Guidance.

Within Phase 1 of the intelligence cycle process model, it appears clear that the DHS HSEC SINs provided the necessary information needs (requirements) to the National Network in an effort to focus their assets on reporting potential terrorist activity in support of the homeland security mission. Nevertheless, the National Network does not have an executive body capable of issuing directives to state and local owned fusion centers that serve their respective jurisdictions.

D. PHASE 2 – PLANNING/DIRECTION

In an April 2009 statement by John E. Bateman, Assistant Commander, Texas Department of Public Safety to the Committee on House Homeland Security Subcommittee on Intelligence, Information Sharing and Terrorism Risk Assessment, he commented that the National Network was designed to be a network of multi-agency intelligence centers, sharing and analyzing information, and then passing that information on to decision makers and first line personnel in the field, allowing these groups to make

[135] The Boston Channel, *Effectiveness of Fusion Centers Questioned*, accessed June 20, 2013, http://www.wcvb.com/news/investigative/effectiveness-of-fusion-centers-questioned/-/12520878/20358362/-/bkveudz/-/index.html#ixzz2aHaeHk5x.

[136] Boston Globe, *FBI Did Not Alert State's Anti-terror Unit to its Probe of Suspected Bomber in 2011*, accessed June 10, 2013, http://www.boston.com/politicalintelligence/2013/04/25/fbi-did-not-alert-state-anti-terror-unit-its-probe-suspected-bomber/RLHZM6GHRotZ6ciIYxmiKP/story.html.

better, more informed decisions as they work to thwart the individuals and groups intended to harm the U.S. While there have been, in the past, multi-agency taskforce operations on the enforcement side designed to address problems relating to crime and terrorism, the National Network is the first true comprehensive nationwide program to combine the analytical and informational capabilities of federal, state, county, local, and tribal agencies.[137]

The planning/direction phase of the intelligence cycle process model at the federal level is generally administered by the DNI and the respective USIC organization. However, within the National Network, there does not exist a centralized element to oversee the administration of this process. Although there existed HSEC SINs focused on preventing terrorist attacks, Senator Joseph Lieberman asked, "did the FBI enlist the help of state and local law enforcement, either on or off the JTTF to continue to watch the brothers, engage with their friends, associates and community leaders or monitor their Internet activities – including Tamerlan Tsarnaev's YouTube account, which openly recommended a collection of jihadist videos – for the purpose of assessing if either or both of the brothers were radicalizing"? Senator Lieberman commented the FBI does not have the resources or personnel to monitor all potential terrorist threats in this country and must rely on state and local law enforcement.[138]

The cultural and legal barriers to effective partnerships among national intelligence elements and the National Network prevent effective planning/direction within the HSE and the new national intelligence structure. The final report of the National Commission on Terrorist Attacks Upon the United States (9/11 Commission) described many instances in which, in the period leading up to September 11, 2001 potentially useful information was available but no one knew to ask for it, information was distributed only in compartmented channels, or information was requested but

[137] *CQ Homeland Security*, "Fusion Center Hearing," accessed August 22, 2012, http://homeland.cq.com/hs/.

[138] Statement for the Record Senator Joe Lieberman (Ret) House Committee on Homeland Security, *The Boston Bombings: A First Look*, accessed July 27, 2013,, http://docs.house.gov/meetings/HM/HM00/20130509/100785/HHRG-113-HM00-Wstate-SchwartzK-20130509.pdf, 2013.

withheld on the basis of a determination that it could not be shared. Twelve years later, Congressional House and Senate members have identified similar challenges remain with threat notification, access to information, and database management of information that may have contributed the 2013 Boston Marathon bombing.

E. PHASE 3 – COLLECTION

The National Strategy for Homeland Security supports the collection of information resulting in actionable intelligence for law enforcement agencies to prevent terrorist attacks. The collection of this information combines state and local criminal intelligence and national intelligence. Historically, domestic intelligence collection is viewed as problematic for law enforcement criminal intelligence when American law enforcement agencies have three primary roles: 1) Solving crimes committed in the past, 2) Preventing crimes that are imminent, and 3) Collecting criminal intelligence to stop future crimes.

Law enforcement criminal intelligence collection is guided by 28 CFR Part 23. 28 CFR Part 23 requires the collection and maintenance of criminal intelligence information concerning an individual, only if there is reasonable suspicion or criminal predicate that the individual is involved in criminal conduct or activity, and only if the information is relevant to that criminal conduct or activity. Because the "reasonable suspicion or criminal predicate" thresholds may be both conjectural and subjective in nature, criminal intelligence information cannot be accessed by criminal suspects to verify that the information is accurate and complete. The protections and limitations set forth in 28 CFR Part 23 are necessary to protect the privacy interests of the subjects and potential subjects of a criminal intelligence system.[139]

The FBI said it took a number of investigative steps to check on the request, including looking at his travel history, checking databases for derogatory information and searching for Web postings. Agents also interviewed Tsarnaev's family members, the

[139] Institute for Intergovernmental Research, *Criminal Intelligence Systems Operating Policies (28 CFR Part 23) Training and Technical Assistance Program*, accessed July 27, 2013, http://www.iir.com/WhatWeDo/Criminal_Justice_Training/28CFR/.

FBI said, but did not detect terrorist activity.[140] Richard Falkenrath, an adjunct Senior Fellow for Counterterrorism and Homeland Security, claim the U.S. authorities support broadminded foreign intelligence-gathering techniques abroad while, "we're instead reliant on more restricted domestic intelligence techniques to identify terrorist before they attack."[141]

Although the FBI and CIA as USIC members conducted a collection of information to determine the threat, a spokeswoman for the Boston Police Department said the Boston Regional Intelligence Center also was never notified about the FBI investigation[142] that may have resulted in the ability to leverage state and local unique capabilities to collect valuable data. In the FBI's final analysis, it concluded there was little it could have done to prevent the Boston Marathon bombing due to constraints provided in federal law and Justice Department protocols.[143] Although federal-level protocols disallowed the FBI from further inquiry, the National Network was also prevented from serving as a force-multiplier in an effort to collect as much information as possible in determining the threat.

While collection is the common variable among various intelligence cycle process models, it is also the most challenging to accomplish given the history of domestic intelligence collection activities by federal agencies and local law enforcement. Within the National Network, collection is implied to address "all-threats," but state and local organizational policies are generally unclear on what information is to be collected and what collection techniques is to be used, notwithstanding explicit statements to protect privacy, civil liberties, and civil rights.

F. PHASE 4 – PROCESSING

The processing of information associated with the Boston Marathon bombing in the context of the intelligence cycle process model proved ineffective because of information sharing challenges and data overload. A FBI Supervisory Agent provided an emailed statement suggesting that state and local officials had ample access to information about the Tsarnaev investigation in 2011, through their participation on the FBI Boston JTTF[144] that include detectives and detective supervisors from the Boston Regional Intelligence Center. Additionally, the Boston Police Department maintains a close and ongoing working relationship with both the FBI and DHS through the intelligence personnel both agencies have assigned to work within the fusion center.[145] While fusion center (National Network) personnel are employed on the FBI Boston JTTF, what has surfaced is that the information was compartmentalized to a point it provided a barrier and prevented a timely notification of potential threat information and intelligence to senior state and local decision makers.

An added challenge to processing information for determining an intelligence value is data overload. Richard DesLauriers, head of FBI Boston stated the FBI's assessment of Tsarnaev was "…one of about 1,000 such assessments conducted by the Boston task force…"[146] leading up to the Boston Marathon bombing. In relation to the processing of information associated with the Boston Marathon bombing, congressional members evoke many of the same themes associated with September 11, 2001. Representative Michael McCaul, Chairman of the House Homeland Security Committee, declared "My fear is that the Boston bombers may have succeeded because our system

[144] Boston Globe, *FBI Did Not Alert State's Anti-terror Unit to Its Probe of Suspected Bomber in 2011*, accessed June 10, 2013, http://www.boston.com/politicalintelligence/2013/04/25/fbi-did-not-alert-state-anti-terror-unit-its-probe-suspected-bomber/RLHZM6GHRotZ6ciIYxmiKP/story.html.

failed,"[147] and Representative Bernie Thompson announced "We cannot ignore that once again it has taken a tragedy to reveal problems in our vast, varied and numerous federal databases."[148]

G. PHASE 5 – ANALYSIS

Analysis in many respects is as difficult to attain as the collection aspect. One critical challenge is the intergroup dynamics between law enforcement investigators and intelligence analysts. Ms. Lisa Palmeiri, noted law enforcement is undergoing a real transformation and recognizing that intelligence is different from simple information as police executives have recognized only a clear comprehension of the analytic process will support public safety officials in protecting the nation.[149] Boston's Commissioner Edward Davis stated his detectives may have concluded the same findings as the FBI in that there was no information (back then) that would have caused further investigation of the Tsarnaev's.[150] What is not stressed in both the FBI findings and the Boston Commissioner's statement is the skill-set and analytic tradecraft employed by supporting analysts. This issue is compounded when dealing with the associated challenges of intelligence management, as well as interagency intelligence collaboration. As an example, how do you effectively balance the demands of current real-time crime intelligence needs and the competing demands for longer-range predictive analysis?

A 2011 The Homeland Security Policy Institute's Counterterrorism Intelligence Survey Research report, indicated 62 percent of the intelligence chiefs representing major metropolitan police departments in the U.S. believed the "national [federal] intelligence enterprise was such that it left them unable to develop a complete understanding of their

local threat environment."[151] Likewise, in the September 2011 Intelligence and National Security Alliance publication, experts agree that many federal intelligence and law enforcement professionals do not recognize the homeland security implications and intricacies of criminal information.[152]

Without the information possessed by FBI Boston, the Boston Regional Intelligence Center analysts were never in a position to help federal authorities connect the dots on a potentially dangerous person. They could not evaluate the relevance of Tsarnaev's six-month trip to Russia in 2012; assess whether his potentially extremist views may have further hardened after he returned to his home in Cambridge; or decide whether authorities needed to interview him again.[153]

In hindsight to the Boston Marathon bombings, the DNI as part of a full interagency review ordered a review and assessment now under way by the U.S. intelligence and law enforcement community. The initial intelligence review had focused largely on regional militant connections the men had in Russia or Central Asia. Initially, before the FBI identified the men, the review was looking at any indications of a threat emerging from overseas against the U.S. Once the identities of the men became known, with their possible ethnic Chechen background, the focus shifted. The USIC is tasked under the review with checking any intelligence gathered overseas while the FBI will focus on what is known inside the United States.[154] As part of the great HSE, the National Network has not been revealed as an element of the review, or the significant role it may have played in preventing the bombing.

H. PHASE 6 – DISSEMINATION

The dissemination of a possible intelligence product may have centered on the differences in the understanding of what was identified as "intelligence" necessary for sharing information associated with the Boston Marathon bombing. The general inclination among law enforcement practitioners is that intelligence is information that leads to successful law enforcement activities. Within this context, the FBI Boston JTTF may have arrived at the conclusion there was no need to share information regarding the bombers. The USIC however, describes intelligence as information that has undergone a formal process, typically using a variation of the intelligence cycle process model. According to a U.S. official familiar with intelligence information on the Boston Marathon bombings, initial indications were that the two suspects do not have direct links to any major al Qaeda group or affiliates, or to a new significant terrorist threat to the U.S.[155] Equally within the context of statement of the U.S. official, the intelligence information referenced was not provided to the National Network, specifically the Boston Regional Intelligence Center.

The National Network, specifically the Boston Regional Intelligence Center, was not in a position to publish an intelligence product identifying concerns and issuing a warning regarding explosive devices hidden in pressure cookers. There is no available public literature or empirical data supporting the use of the intelligence cycle process model associated with information processing was used in respect to producing indications, watch and warnings intelligence in an effort to prevent the Boston Marathon bombing. The issues associated with the adherence of the intelligence cycle process model underscore the challenges that remain within the National Network relative to the effectiveness of the intelligence cycle process model.

I. CONCLUSION

The writer's analysis of the 2013 Boston Marathon bombing offers the National Network nor the HSE adhered entirely to the intelligence cycle process model in order to

[155] CNN, *FBI Agents Interviewed Bombing Suspect in 2011*, accessed April 21, 2013, http://www.cnn.com/2013/04/19/us/boston-suspects-no-links/index.html.

forecast or prevent the terrorist act. This type of event was forecasted nine years earlier in 2004 when DHS issued a issued a warning regarding explosive devices hidden in pressure cookers, also there existed HSEC SINs to identify and document relevant information needs. In addition, a National Intelligence Estimate entitled *The Terrorist Threat to the U.S. Homeland* was issued in July 2007 designating an attack like the Boston bombing was a concern for the U.S. government.[156]

The writer identified several key issues underscored in the April 15, 2013, Boston Marathon bombing associated with employing the intelligence cycle process model at the state and local level as an appropriate HSE intelligence cycle process model. Adherence to the intelligence cycle process model revealed its ineffectiveness due to delays in access to relevant information between the FBI and local law enforcement. Recognizing that successful counterterrorism efforts require effective information sharing, Section 1016 of the 2004 IRTPA (Public Law 108–458), building on the August 27, 2004, EO 13356, "*Strengthening the Sharing of Terrorism Information to Protect Americans*," required the creation of the Information Sharing Environment (ISE) for terrorism information. What also emerges is the challenge of identifying and prioritizing to whom and what information is to be shared by agencies within the HSE that supports the requirements/needs process.

The 9/11 Commission Report that described instances leading up to September 11, 2001, clearly reflected that potentially useful information was available, but no one knew to ask for it; information was distributed only in compartmented channels, or information was requested but withheld on the basis of a determination that it could not be shared. Each challenge is linked to effective adherence of the intelligence cycle process model, specifically planning and direction (Phase 2), collection (Phase 3), processing (Phase 4) and analysis (Phase 5) within the National Network and in this case similar to the Boston Marathon bombing. This exposes the continued need to address the

[156] Statement for the Record Senator Joe Lieberman (Ret) House Committee on Homeland Security, *The Boston Bombings: A First Look*, accessed July 27, 2013, http://docs.house.gov/meetings/HM/HM00/20130509/100785/HHRG-113-HM00-Wstate-SchwartzK-20130509.pdf.

ISE designed to support sharing and access to terrorism information, including information from the intelligence, law enforcement, military, homeland security, and other communities.

Individual departments and agencies have their own policies and procedures for information sharing, but there is no single government-wide agreement on what constitutes appropriate information sharing. Different standards exist among agencies (and even within agencies) for the designation and dissemination of terrorism information, resulting in different views on who requires the information and when and how the information is needed and processed. Because information protection standards vary, decisions on reconciling the need to protect information and the need to share information have been inconsistent and have contributed to the creation of cultures that support information segregation. A fundamental change must occur so that, in the dynamic setting of the new ISE, the right information is available to the right people at the right time.[157]

Consistent with the work of the Information Systems Council under Section 5 of EO 13356, one of the ISE's goals is to remove technology as a barrier to improved information sharing. For the most part, the technology needed to improve interoperability and information sharing is available today; and it should be an enabler rather than a barrier. While it is true that users face a vast and confusing array of systems, databases, networks and tools, in most cases this vast and confusing array is caused not by technological barriers, but by the policies, protocols, and sometimes security and legal concerns that prevent us from connecting the systems and sharing information in an optimal way.[158]

An area that remains to be developed is an appropriate identity-based screening system, to include biometrics and an improved visa threat analysis system. Law enforcement agencies have had to rely more on traditional investigative techniques to

[157] Office of the Director of National Intelligence, *Preliminary Report on the Creation of the Information Sharing Environment*, accessed August 8, 2011, http://www.ise.gov/sites/default/files/preliminaryreport.pdf.

detect terrorist travel concerns, which resulted in the arrest of two U.S. citizens in New York after allegations they planned to travel to Somalia to join al-Shabaab.[159] The lack of a direct mechanism to share terrorism-related information between law enforcement agencies, along with the sheer amount of data that a JTTF in a major city has to sort through, are two issues that should be addressed in light of these attacks.

THIS PAGE INTENTIONALLY LEFT BLANK

V. INTELLIGENCE CYCLE PROCESS MODEL AND THE HOMELAND SECURITY ENTERPRISE

A. HOMELAND SECURITY ENTERPRISE AND EMPLOYING THE INTELLIGENCE CYCLE PROCESS MODEL

Intelligence can no longer be defined in the context of ascertaining the capabilities and intentions of other nation-states abroad while systemically providing access to such intelligence to only an elite community of federal level intelligence analyst and collectors. The 9/11 terrorist attacks brought the intelligence function and the associated intelligence cycle process model to the forefront of the HSE. The post-9/11 HSE requires an intelligence cycle process model with the capability to operationalize intelligence gaps necessary for preventing terrorist acts from international terrorist groups operating abroad and within U.S. borders, domestic terrorist groups and homegrown violent extremists. It also requires providing timely results of intelligence cycle process model information (intelligence) to federal, state, and local customers. It is essential that officials responsible for the various aspects of homeland security fully realize the robust capacity of the national intelligence architecture. The U.S. government has the responsibility to dutifully and deliberately consider the Nation's approach and actions given the complexity and uniqueness of operating within the domestic intelligence realm.[160]

In order to maximize the capabilities of the HSE, the intelligence cycle process should address both a dynamic "top-down" and "bottom-up" approach as a contributor to the national intelligence architecture. The USIC traditional intelligence cycle process model is a "top-down" approach that was originally constructed to addresses military and national policy maker information needs. National policymakers requested information and assessments concerning foreign capabilities and threats and their potential to affect U.S. interests abroad, as well as U.S. preparations for defeating military foreign threats. A "bottom-up" approach to the intelligence cycle process model provides state and local decision makers, public safety officials and the private sector the ability to influence and

[160] The White House, *Strategic Implementation Plan for Empowering Local Partners to Prevent Violent Extremism in the U.S.*, December 2011, 3.

shape national interest through fusion centers operating within the National Network at the state and local level. There exists a credible need for a new intelligence process model that integrates the post-9/11 HSE and with it a need to train these diverse groups. Developing an intelligence process that integrates both, a "top-down" and "bottom-up" approach provides a comprehensive evaluation of the threats to homeland security that affect all levels of government and engages multiple public safety disciplines.

B. INTELLIGENCE CYCLE PROCESS MODEL TRAINING

Members of the USIC have developed organizational institutions to train its intelligence elements on the intelligence cycle process model most fitting their organization. The CIA has the Sherman Kent School for Intelligence Analysis that provides specialized training in the craft of intelligence analysis.[161] In 2005, the FBI established the Intelligence Career Service comprised of intelligence analysts, language specialists and surveillance specialists personnel with intelligence training at the College of Analytical Studies. It was later changed to the Center for Intelligence Training to provided basic and advanced training for FBI analysts and agents.[162] The Department of Defense provides intelligence training via individual service institutions and jointly through the National Intelligence University located within the Defense Intelligence Analysis Center that focuses on the profession of intelligence and offers an in-depth curriculum intended to enhance the analytical skills and competencies of intelligence analysis.[163] The DHS I&A Training Branch established the Homeland Security Intelligence Training Center to strengthen DHS intelligence enterprise capabilities, enhance collaboration among the intelligence offices of the department's components, and provide specialized intelligence training to state and local officials.[164]

The DHS also supports formal degree granting opportunities with tailored intelligence instruction through the Naval Postgraduate School – Center for Homeland Defense and Security.

In October 2007, the DOJ Global Justice Information Sharing Initiative commonly referred to as Global, published the *Minimal Criminal Intelligence Training Standards for Law Enforcement and Other Criminal Justice Agencies in the United States*. Global serves as a federal advisory committee to the U.S. Attorney General on critical justice information sharing initiatives.[165] The Global training philosophy is intended to "…develop a culture of information analysis and information sharing within the law enforcement communities…"[166] Global defines the intelligence cycle as "an organized process by which information is gathered, assessed and distributed in order to fulfill the goals of the intelligence function. It is a method of performing analytic activities and placing the analysis in a usable form."[167]

Global identified objectives for law enforcement intelligence analyst, intelligence managers/commanders, executives, and officers. Within these objectives is a standard for training the intelligence process/cycle that includes topics to be considered: Collection, analysis, dissemination, production, collation, evaluation, and assessment within a three-hour block of instruction for law enforcement analysts and managers.[168] The law enforcement officer basic criminal intelligence officer provides for 40-minutes of training to include the officer's role and responsibilities in the intelligence process/cycle.[169] Global does not identify sequential steps common within the USIC nor provide illustrations of the intelligence cycle.

Though HSE partners, specifically state and local officials, have limited opportunities to attend in-residence training opportunities at the USIC member

[169] Ibid., 18.

institutions, there are far more intelligence focused training opportunities presented to state and local officials through on-site mobile training events sponsored by a number of elements. Through the DHS/DOJ Fusion Process Technical Assistance Program and Services, DHS FEMA sponsored MIPT and the Institute of Intergovernmental Research delivers on-site mobile training opportunities to the National Network, as well as the state and local members of the HSE. In order to effect the required change, some have opined the need to establish as national center for intelligence training in conjunction with a national intelligence strategy. Although a national center has not been established, the Governor of Texas designated the Texas Department of Public Safety, Intelligence and Counter-Terrorism Division (DPS-ICT) as the proponent for intelligence for the State of Texas. The DPS-ICT, in concert with criminal justice professors at Texas State University, has initiated a project intended to create a certification program providing statewide training and an education baseline for all analysts in Texas.[170] While many have echoed the sentiment regarding specific intelligence training to state and local law enforcement, there has been little realization of the kind of training that state, local, and tribal law enforcement communities need to be truly effective homeland security partners.[171]

The need for integration of the state and local environment into nation's intelligence effort was a principal finding of the USIC assessments in the wake of the 9/11 attacks and desired goals of subsequent national strategies. In addition to the USA PATRIOT Act, the 2004 IRTPA provided the DNI and is responsible for establishing intelligence community-wide policies. Yet, there remain challenges and practical implementation with the intelligence cycle process model and domestic intelligence collection by the HSE, as noted in the previous chapter. It is critical to recognize and define how the USIC intelligence cycle process model is to be employed within the HSE at the state and local level. Equally significant is ascertaining if a standardized

[170] Texas Department of Public Safety, *IDP's for Intelligence Analysts at the Texas Department of Public Safety PowerPoint*, accessed October 7, 2013, www.iafie.org/resource/resmgr/2012_conference/mullins.pptx.

[171] Law Enforcement Assistance And Partnership, *A Law Enforcement Assistance and Partnership Strategy, Improving Information Sharing Between the Intelligence Community and State, Local, and Tribal Law Enforcement*, 5.

intelligence cycle process model exists that is capable of being employed effectively within the USIC, the HSIE, as well as the HSE. As noted in previous chapters, there are many versions of the intelligence cycle process model that is generally aligned to an organizations' mission space and numerous intelligence training venues theoretically serving to provide some aspect of training on the intelligence cycle.

C. STATE AND LOCAL LAW ENFORCEMENT COMMUNITY

A key element of the HSE is the state and local law enforcement community. Intelligence in law enforcement has historically been misunderstood, underutilized, and even misapplied. With 18,000 local and state law enforcement agencies in the U.S., there is a critical need to provide and coordinate education, training, and professional services related to domestic intelligence collection activities and the employment of a standardized intelligence cycle process model. There are many misconceptions about the meaning and application of intelligence within law enforcement, although the IACP Criminal Intelligence Sharing Plan provides "intelligence is the combination of credible information with quality analysis - information that has been evaluated and from which conclusions can be drawn.[172]

Ms. Lisa Palmieri suggests the intelligence cycle process model is not fully explored in the law enforcement community within the context of criminal investigations because case information collected during an investigation is often considered "peripheral to proving the elements of the crime." Additionally, Ms. Palmeiri claims the training of law enforcement officials and intelligence analysts has not been institutionalized necessary for incorporating "intelligence as an element of policing culture [that] would address the challenge of evaluating intelligence analysts in police agencies."[173]

Various reports identify more than 800,00 law enforcement officials nationwide responsible for public safety. Being able to provide intelligence products that support

[172] David L. Carter, U.S. Department of Justice, Office of Community Oriented Policing Services, *Law Enforcement Intelligence: A Guide for State, Local, and Tribal Law Enforcement Agencies*, 2nd ed., January 2009, 10, 13.

[173] Lisa M. Palmieri, Law Enforcement Intelligence Units and International Association of Law Enforcement Intelligence Analysts, *Challenges Facing Law Enforcement Intelligence*, 2011, 313.

more than 800,000 state and local law enforcement officials and the private sector requires a new approach to the intelligence cycle process model. Given the 18,000 state and local law enforcement agencies operating within the HSE, and the misconceptions about intelligence, the type of products disseminated generally fails to satisfy varied and numerous customer needs.

In the 1970s, standards were introduced requiring police departments to articulate "criminal predicate" before beginning intelligence operations on members of the community. In the 1980s, the Regional Information Sharing System was established and implemented through the Criminal Intelligence Operating Policies at the federal level - 28 CFR Part 23.[174] A noticeable distinction exposes the current USIC intelligence cycle process model in that it does not require criminal predicate, on the other hand, 28 CFR Part 23 does not address the collection of information for policymakers, yet both are in use within the HSE in support of domestic intelligence collection activities.

Police officers' and sheriff's believe that in order to be effective in preventing terrorism and related criminal activity; it is essential that they fully participate in the intelligence cycle process at both the federal and nonfederal levels. Additionally, they must become advocates for law enforcement intelligence products that meet their information needs and ensure law enforcement intelligence and other information is shared with their communities.[175] The current USIC intelligence cycle process model paradigm fosters aggressive, active intelligence gathering. It anticipates the threat before it arises and plans preventive action against suspected targets. In contrast, the law enforcement paradigm fosters reactions to information provided voluntarily, uses ex post

[174] Roger G. Dunham, Geoffrey P. Alpert, Jennifer E. Davis, and Robert W. Taylor, *Intelligence-Led Policing and Fusion Centers, Critical Issues in Policing: Contemporary Readings*, 6th ed. (Waveland Press, 2010), 226–227.

[175] Law Enforcement Assistance And Partnership, *A Law Enforcement Assistance and Partnership Strategy, Improving Information Sharing Between the Intelligence Community and State, Local, and Tribal Law Enforcement*, 1.

facto arrests and trials governed by the rule of law, rules of evidence, and the protection of the rights of American citizens.[176]

Although law enforcement agencies need background information or "strategic intelligence" regarding patterns of criminal activity (e.g., analysis indicating that increasing quantities of cocaine are flowing through harbors in southern Florida), they tend to give higher priority to tactical information (e.g., a tip that a specific cargo vessel is scheduled to off-load a shipment of cocaine at a specific dock in Miami on the night of August 4). However, national policymakers require a continuous stream of information about countries, groups, and individuals working against U.S. interests. There is no end-point to these requirements; even a favorable evolution of events does not mean the end of the need for up-to-date information. In many cases at the federal level, the need for intelligence is more important than the need for dealing with a particular incident.

D. PRIVATE SECTOR

In addition to the National Network, primarily supported by state and local law enforcement, there is a philosophy to integrate and maintain relationships with the private sector to support the needs of the national intelligence architecture. The are 15 private sectors Information Sharing and Analysis Centers (ISAC) considered operational organizations that collect, analyze, and share threat and vulnerability information to protect critical infrastructure.[177] These private sector elements with specialized capabilities can and are being used to address national security concerns and homeland security threat issues. These ISACs[178] are: the Communications ISAC; the Electric Sector ISAC; the Emergency Services ISAC; the Financial Services ISAC; the National Health ISAC; the Information Technology ISAC; the Multi-State ISAC; the Maritime Security ISAC; the Nuclear Energy Institute; the Public Transportation ISAC; the Surface Transportation ISAC; the Real Estate ISAC; the Research and Education ISAC; the

[178] National Council of Information Sharing and Analysis Centers, accessed August 10, 2013, http://www.isaccouncil.org/memberisacs.html.

Supply Chain ISAC; and the Water ISAC, all of which enhance information sharing and serve as analytic centers within the private sector.

With the integration of private sector elements into the HSE and their value-added to information sharing, questions arise as to the intelligence cycle process model being trained by the elements mentioned previously. The success of U.S. intelligence at home will increasingly depend on a new form of domestic intelligence collection against specific threats and on the forging of a deep partnership with the American nation, from local law enforcement to the private sector.[179]

Within the governance structure of the National Network, the *Baseline Capabilities for State and Major Urban Area Fusion Centers* provides fusion centers "shall have a governance structure that provides appropriate representation for the jurisdictions and disciplines in the center's area of responsibility," and as an example it reflects "including representatives from…the Information Sharing and Analysis Centers…" in support of Fusion Center Guidelines 3, 4, and 5.[180] In highlighting the role of fusion centers in national security, DHS posits "The national security enterprise must reach beyond the capabilities of the federal government and national intelligence community to identify and warn about impending plots that could impact the homeland, particularly when the individuals responsible for the threats operate within the United States and do not travel or communicate with others overseas."[181] Given DHS I&A's responsibilities as a USIC member, it has the largest customer set than any other intelligence community member.

This thesis summarizes there are no fewer than an estimated 175 federal, state, local law enforcement, and private sector establishments contributing to the responsibility for sharing homeland security information through the conduct of collecting, analyzing

[179] Jennifer E. Sims, and Burton Gerber, *Transforming U.S. Intelligence* (Washington, D.C.: Georgetown University Press, 2005), 198.

[180] U.S. Department of Homeland Security and U.S. Department of Justice, *Baseline Capabilities for State and Major Urban Area Fusion Centers: A Supplement to the Fusion Center Guidelines***,** September 2008, 23.

[181] U.S. Department of Homeland Security, *State and Major Urban Area Fusion Centers*, accessed February 24, 2012, http://www.dhs.gov/files/programs/gc_1156877184684.shtm.

and disseminating threat information based on the number of USIC member organizations, HSIE elements, fusion centers, FBI Field Intelligence Groups, and private sector ISACs. At the federal level, there are 17 members of the USIC; within the USIC there are 56 FBI Field Intelligence Groups as elements of the FBI National Security Branch; three (3) DHS headquarters elements and six (6) operational component intelligence elements that make up the HSIE for a total of (9); at the state and local level there are 78 DHS/DOJ recognized fusion centers; and at the private sector level 15 ISACs. These 175 entities that make up the HSE has received or may receive some form of training on the varied intelligence cycle process models from various federal level, federally sponsored or academic institutions.

The number of intelligence cycle process models, as well as the amount of intelligence consumers, is as varied as the number of intelligence producing entities. Policymakers exist at all levels of government, law enforcement elements operate at all levels of government and other public safety officials provide prevention, protection, recovery, and response resources at all levels of government. Additionally, the private sector, likewise, supports the prevention, protection, recover, and response mission spaces that integrates the business community yet another intelligence consumer. Because of the post-9/11 HSE, these entities now serve as key partners in the first phase of the intelligence cycle – planning and direction. However, a vital question surfaces; who is responsible for determining the planning and direction, as well as prioritizing, what should be collected in order to ensure appropriate finished intelligence is produced and disseminated as an end-result of the intelligence cycle process model? Can the National Network serve as an effective analytic element at the state and local level for such an enormous customer base?

Additionally, with the diverse numbers of intelligence cycle process models and the assorted training venues another question remains; is it appropriate to employ the intelligence cycle process model in an effort to detect significant national security and homeland security threats originating or residing within our nation's borders provide it was not designed and intended to serve as such? Further, is it possible to evaluate the

USIC intelligence cycle process model in the performance of domestic intelligence collection activities at the state and local level in support of the HSE?

A new intelligence cycle process model would provide an opportunity for a more cohesive community of stakeholders who could both exploit training and educational opportunities to the benefit of the collective whole.

E. PRACTICAL CHALLENGES TO EMPLOYING THE INTELLIGENCE CYCLE PROCESS MODEL

Two key challenges to employing the USIC intelligence cycle process model is defining the term *homeland security intelligence* and the lack of access to information necessary to provide a comprehensive threat picture. A challenge to adopting a standardized intelligence cycle process model within the HSE may be associated with the fact the term *homeland security intelligence* has not been defined or codified in law.[182] The closest definition provided by law is the term *homeland security information* provided in the 2002 Homeland Security Act that states it is;

> any information possessed by a federal, state or local agency that (a) related to the threat of terrorist activity, (b) relates to the ability to prevent, interdict or disrupt terrorist activity, (c) would improve the identification or investigation of a suspected terrorist or terrorist organization, or (d) would improve the response to a terrorist act.

There are clear challenges associated with effectively employing initial phases of the intelligence cycle process model - planning and direction, as well as collection - at the state and local level given the independent nature of stakeholders. What element serves as the compromising authoritative body for determining planning and direction for the National Network and broader HSE? What element ensures access to information when it is incomplete due to information sharing disputes between agencies (whether cultural or procedural)? What element shoulders the responsibility to address the lack of standardized training given the various forms of intelligence cycle process models? As argued previously, proper planning and direction, as well as efficient information

[182] Mark A. Randol, Congressional Research Service, *Homeland Security Intelligence: Perceptions, Statutory Definitions, and Approaches*, RL33616, January 14, 2009, 9.

collection within the HSE, increases the performance of the final intelligence product aimed at providing situational awareness and a common threat picture for all stakeholders.

The U.S. counterterrorism strategy and its implementation have seen little progress since the terrorist attacks of 9/11. The "shared responsibility" proposition has not been fully realized in the sharing of intelligence and threat information at all levels of government or the "whole of government" approach to counterterrorism investigations. This concern directly affects DHS' ability to share intelligence and threat information with state, local, and private sector partners as mandated by the 9/11 Commission Act, particularly given that the DHS State and Local Program Office has a mandated role to support the National Network as state and local intelligence collection and analytical centers.

F. CONCLUSION

Within this thesis, the writer identified several critical moments in U.S. history that initiated major intelligence reform at the federal level, as well as the state and local levels of government. The attack of Pearl Harbor in 1947 and the subsequent involvement in World War II, initiated the creation of the USIC per the 1947 National Security Act. In 1981, President Ronald Reagan issued EO 12333 *United States Intelligence Activities* in order to address domestic intelligence collection abuses by federal level government agencies. During the same general period, the "1983-suits" were legal actions brought against local police intelligence units in the 1960s and 1970s for violating citizen groups' First Amendment rights. This period facilitated the establishment of IALEA and the establishment of 28 CFR Part 23 that provides guidance for criminal intelligence. The tragic and horrible attack on the U.S. by international terrorist on September 11, 2001, initiated the creation of DHS, and subsequently, the DHS I&A State and Local Program Office charged with providing federal level support to the National Network and HSE. After 9/11, the IACP endorsed ILP and the Major City Chiefs' initiated the MCC Criminal Intelligence Enterprise.

Table 2, constructed by the author, provides a visual snapshot of the gaps in synchronizing federal level intelligence initiatives and integration. While the post-9/11 National Network was not established until 2003, history reveals a pattern of addressing domestic intelligence collection issues. Based on the information reflected, one can deduce the timeframe gaps between federal level intelligence doctrine and intelligence cycle process employment and the establishment of local level intelligence guidance and intelligence process endorsement. As an example, there was 24 years from the initiation of the first U.S. Army-wide intelligence doctrine to the first documented intelligence cycle process model [1920–1944] and 27 years until the creation of the USIC [1920–1947]. There was 33 years from the creation of the USIC to the establishment of the IALEA, formalizing efforts to professionalize law enforcement analysts and the establishment of the Regional Information Sharing System operating under 28 CFR Part 23 [1947–1980]. The IACP, which was established in 1893, did not endorse intelligence-led policing until 19 years later in 2002, the same period in which DHS was created under the 2002 Homeland Security Act. In 2007, the 9/11 Commission Act established the DHS I&A State and Local Program Office for the specific purpose of providing federal level intelligence support to the National Network created in 2003. Establishing intelligence training guidance at the state and local level, external to the National Network occurred in 2007 with the Major City Chiefs' establishment of the Major City Chiefs' Criminal Intelligence Enterprise four years later in 2011. The White House supported the intelligence progress at the state and local level and issued EO 13470 in 2008 that amended EO 12333 to include the state and local environment within the U.S. Intelligence Activities guidance, as well as establishing EO 13594 two years later in 2010 that provided guidance for state and local access to national security information. The intent of the aforementioned chronology of intelligence initiatives is to provide a visual snapshot of the gaps between time in the synchronizing of federal level intelligence initiatives and integration of the National Network and the broader HSE.

Table 2. Timeline Reflecting Intelligence Policy Engagement among Federal and Local Environment

Date	Organization	Intelligence Initiative
1920	U.S. Army	U.S. Army-wide intelligence doctrine
1944	U.S. Army	First documented intelligence cycle process model
1947	White House & Congress	Established U.S. Intelligence Community
1980	International Association of Law Enforcement Analyst	Professionalize law enforcement analytic cadre and increase capabilities
1980	Regional Information Sharing System	RISS established and implemented through the Criminal Intelligence Operating Policies at the federal level - 28 CFR Part 23
1981	White House	Established Executive Order 12333 - U.S. Intelligence Activities; provides guidance for U.S. intelligence activities among USIC members
2002	International Association of Chiefs' of Police	Established in 1893; endorsed intelligence-led policing
2003	National Network of Fusion Centers	Established state & local intelligence and information sharing network
2007	DHS I&A	Establish a DHS State, Local, and Regional Fusion Center Initiative necessary for establishing partnerships with state, local, and regional fusion centers; specifically section (b) (11) mandates providing training to state, local, and regional fusion centers
2007	DOJ Global Justice Information Sharing Initiative	Published the minimal criminal intelligence training standards for law enforcement and other criminal justice agencies in the U.S.
2008	White House	Amended EO 12333 via EO 13470 to include state & local environment
2010	White House	Established EO 13549; provided state & local access to classified national security information
2011	Major City Chiefs'	Established Major City Chiefs' Criminal Intelligence Enterprise

In theory, the intelligence production cycle, otherwise known as the intelligence cycle, is the process by which information is acquired and converted into an assessment or estimate begins and ends with the policy maker. Ideally, policymakers advise the managers of the USIC collection and production organization of their informational needs. In practice, it is often up to intelligence managers to gauge and anticipate policy maker's needs because policy makers have never been particularly diligent or effective in articulating their informational needs. Yet, today DHS I&A field deployed personnel not only provide training on the intelligence cycle process model, but they are also requested to manage the intelligence cycle in their area of responsibility to include the sharing of threat-related information between SLTPS partners and the federal government. Throughout the literature review and case study, the writer offered the intelligence cycle process model serves as a theoretical concept allowing academic comprehension by nonintelligence individuals. The writer also reasoned, based on the interpretation of literature, case study to include professional experience and observation, the practical employment of the intelligence cycle process model at the strategic and operational levels within the post-9/11 HSE has not fully been studied in order to evaluate its effectiveness or appropriateness.

This document was intended to provide awareness of employing the intelligence cycle process model and initiate dialogue regarding standardizing an intelligence cycle process within the HSE. The writer acknowledges there are possible challenges with attempting to standardize the intelligence cycle process model. The obvious challenges to the enormous task of standardizing a domestic intelligence cycle process given the numerous and varied stakeholders at the federal, state and local level are identifying who would serve as the principle oversight and/executive agency for standardizing such a training program. While the DNI is the executive agency for the USIC, additional thought would have to be given to integrating the state and local level, as well as the private sector. At the state and local level, the National Fusion Center Association represents the National Network, and they are in an executive position to provide influence for the training requirements. Similarly, the IACP, the MCCIE, and IALEIA serve as influencing bodies for elements external to the National Network. The private sector as critical

elements of the HSE may prove as the most challenging when integrating key elements into discussions of standardizing the intelligence cycle process model.

Another challenge deals with building consensus among the numerous and varied HSE stakeholders regarding the design of an intelligence cycle process model that appropriately addresses USIC intelligence requirements and the intelligence information needs for nontraditional intelligence elements. In proposing and developing a new intelligence cycle process model, considerations must be given to the varying analytic and operational paces of the intelligence, law enforcement, and private sector environments. The timeframe provided for pure USIC analytic and operational differ significantly from the analytic and operational environments of the National Network, the great law enforcement and private sector communities.

In conclusion, drawing on publicly available information from government, academia, and national security consortiums, analysis revealed broad acceptance of the intelligence cycle process model philosophy. However, literature provided by academic and operational practitioners support claims that the intelligence cycle process model is flawed and not practical in the operational environment. This thesis may serve as a basis for recommending additional research necessary for studying the intelligence cycle process model implementation and employment within the HSE and its effectiveness in preventing terrorist attacks and enhancing national security intelligence.

NATIONAL SECURITY AGENCY
CENTRAL SECURITY SERVICE
FORT GEORGE G. MEADE, MARYLAND 20755-6000

Serial: MDR-68578
11 June 2013

This responds to your 2 August 2012 request for the declassification review of the following NSA document: *A Collection of Writings on Traffic Analysis*. The material has been reviewed under the Mandatory Declassification Review (MDR) requirements of Executive Order (E.O.) 13526 and is enclosed. We have determined that some of the information in the material requires continued protection from public release.

Some portions deleted from the document are currently and properly classified in accordance with E.O. 13526. The information denied meets the criteria for classification as set forth in Section 1.4 subparagraphs (c) and (d) and remains classified TOP SECRET, SECRET and CONFIDENTIAL as provided in Section 1.2 of E.O. 13526.

Additionally, section 3.5 (c) of E.O. 13526 allows for the protection afforded to information under the provisions of law. Therefore, the names of NSA/CSS employees and information that would reveal NSA/CSS functions and activities have been protected in accordance with Section 6, Public Law 86-36 (50 U.S. Code 402 note).

Since your request for declassification has been partially denied you are hereby advised of this Agency's appeal procedures. Any person denied access to information may file an appeal to the NSA/CSS MDR Appeal Authority. The appeal must be postmarked no later than 60 calendar days after the date of the denial letter. The appeal shall be in writing addressed to the NSA/CSS MDR Appeal Authority (DJ5), National Security Agency, 9800 Savage Road, STE 6881, Fort George G. Meade, MD 20755-6881. The appeal shall reference the initial denial of access and shall contain, in sufficient detail and particularity, the grounds upon which the requester believes the release of information is required. The NSA/CSS MDR Appeal Authority will endeavor to respond to the appeal within 60 working days after receipt of the appeal.

Sincerely,

BLAKE C. BARNES
Chief

Foreword

If the professional field of traffic analysis has had its ups and downs, the need for its skill and art has never really diminished. Like Mark Twain, its early demise has been reported at regular intervals, but, happily, has always proved premature. Even though the discipline may change as a career field, the value to the cryptologic mission of contributions made by traffic analysis - and traffic analysts - continues.

Captain Duane Whitlock, USN, a veteran of cryptologic activity on Corregidor before World War II, speaking at the 1992 Symposium on Cryptologic History at NSA, emphasized and reemphasized the indispensability of traffic analysis. In that period of crisis before Pearl Harbor, traffic analysis worked closely to support cryptanalysis, and during periods when systems were unreadable, TA constituted the only means of following developments in the armed forces of a potential enemy.

Half a century after the attack on Pearl Harbor, we need to understand that despite more sophisticated collection and processing, traffic analysis still makes basic and vital contributions to the national mission.

Vera Filby has collected a number of thought-provoking articles on traffic analysis into one handy volume. This reader serves many purposes, not the least of which is to stimulate us into considering how the field has changed, what roles traffic analysis has played in the past, and what it can do for the cryptologic mission in the future.

Reduced to slogans, this is a good book for times like these, and these are good times for a book like this.

DAVID A. HATCH
Director,
Center for Cryptologic History

Preface

In 1989 NSA Senior Executive [redacted] proposed the creation of a series of readers in cryptology to make more readily available some of the literature in the several cryptologic disciplines that has accumulated over the years in the National Security Agency. The present collection of occasional articles on traffic analysis (TA) is offered to the cryptologic community as a first contribution to what it is hoped will be a continuing program. The articles reflect the times and circumstances of their creation and thus present a picture of traffic analysis across a span of nearly half a century.

Sources were mainly the *NSA Technical Journal* (published 1956-1981), *COMMAND* (1968-73), *Cryptolog* (1974-present), and *Cryptologic Quarterly* (1981-present). Articles on various aspects of TA, along with letters to the editor and TA problems, published in these and other journals, amounted to some 300-350 pages, making selection imperative. Several of the articles describe TA techniques. Many concern the problems, both technological and professional, attendant on the automation of TA. Others recount TA stories and successes. Some originated as briefings or addresses.

Choices for this collection were hard since almost all the candidates were worthy of inclusion. The selections are arranged by subject within three chronological periods: the first twenty to twenty-five years, the 1970s, and the 1980s. The TA problems were omitted for lack of space. It is hoped they may eventually be published separately.

The items included may seem a scant production for forty-odd years. But they are personal writings, voluntary offerings to communicate ideas, to teach, to present an argument, to tell a story. They are on a quite different plane from the technical and related production of traffic analysis: SIGINT technical reports; astronomical numbers of technical records, supplements, files, messages, working aids, and weekly TA notes; professional studies, reviews, and development plans; and training aids and manuals. A training manual, *Radio Traffic Analysis*, by Robert S. Benjamin, published in 1955, was a major literary production. This exhaustive treatise was the training standard and bible for traffic analysts for many years.

~~FOR OFFICIAL USE ONLY~~

A Capsule History of Traffic Analysis

THE FIRST QUARTER CENTURY

During the early years of the Armed Forces Security Agency and NSA, little was published to record the development of TA. But in the mid-1960s, evidence of an attention to TA as a discipline and career and concern for its status and future began to appear in written articles. This was in tune with the Agency's growing concern for the state of cryptologic disciplines, which resulted in the establishment of the professionalization program. In 1967 the beginnings of a TA library were established, and in 1968 the Techniques and Standards group, P1, and the TA Career Panel sponsored a TA workshop. Papers presented at its several sessions were later collected in response to a call for TA documentation. In October 1968 the first issue of *Command* was published, and the following year the Communications Analysis Association was formed.

Computers have been used in TA applications since the 1940s, but it was in the mid-1960s that the first wave of the computer revolution began to cause tremors in the work force. Many analysts were distrustful and apprehensive, both for their discipline and for their careers; but others were ready and eager to participate in the development of automation. Communication between analyst and computer programmer was a serious problem. Part of the eventual solution was in training traffic analysts to become computer programmers.

THE 1970s

The momentum begun in the late 1960s led to the Traffic Analysis Mechanization Forum in February 1970, where twenty-four briefings were presented. This was followed by the Traffic Analysis-Mathematics Symposium in May 1971 with twenty briefings. Compilations of these briefings were published in P1.

The level of energy, thought, and activity in the study of traffic analysis declined in the mid-1970s. Automation, decreased need for TA in targets where the communications structure had been largely recovered or where communications had become exploitable, and limitations in Agency fiscal resources reduced the size and depressed the morale of the TA work force. Early retirements, resignations, and moves into data systems, management, and other areas thinned out the ranks. Training requirements fell so low that the sole TA instructor remaining in the National Cryptologic School (NCS) had time for other duties.

THE 1980s AND BEYOND

Although the decline in Agency strength had reversed by the beginning of the 1980s, TA as a career remained at the same level, despite the fact that the volumes of traffic pouring into the data banks continued so vast that much of it could not even be looked at, while at the same time new communications and advanced systems appeared and had to be dealt with. Many analysts were still trying to get used to – or resigned to – computers, and they suffered prolonged frustration and dissatisfaction with systems they found unhelpful. Nevertheless, by the mid-1980s new waves of computerization had swept through the Agency, and a computer environment eventually prevailed.

A growing awareness of a need for cryptologic renewal characterized the early 1980s. The prospect of a future of struggle against new and increasingly complex signals underscored the need to enhance the vigor, skills, and creativity of the work force. It became clear also that future problems would call for multidisciplined approaches.

In the 1980s studies were undertaken to assess the situation and plans formed to deal with it. Programs and projects, both major and minor, were set in motion. One of these was RELOAD. Project RELOAD's stated purpose was to restore analytic and reporting responsibilities to the field, where during many years of centralization analytic skills had weakened. RELOAD became the driving force for rejuvenation and change both at headquarters and overseas, and its effects continued to proliferate throughout the decade.

Under RELOAD, a Traffic Analysis Working Group (TAWG) began in 1986 to examine the traffic analysis career field. The group's final report, presented as the Traffic Analysis Focus Plan in 1989, recorded its finding that major systemic reforms were needed and provided a list of proposals and actions taken. One of the proposals was the creation of an Intelligence Analysis career field combining TA and Intelligence Research -- an idea that had been put forth in earlier years but discarded. This time it was accepted, and beginning in 1987 working groups developed career structures, established professional standards, and identified training needs. Their prolonged efforts culminated in the inauguration of the Intelligence Analysis career field on 1 January 1991.

RELOAD and technical change resulted in a greatly increased need for training. To meet it, the NCS recruited more instructors and greatly expanded the use of adjunct faculty. By 1989 the TA faculty were teaching or developing a total of nineteen courses, and more than forty adjunct instructors were certified to teach one or more courses. To recognize outstanding talent, the TAWG established the Gold Nugget Award; the first was presented in 1989.

The NCS held a TA Curriculum Review in mid-December 1990. During the course of the presentations, it appeared that the prospect for TA in the 1990s ranges from the conventional to the experimental, from traditional net reconstruction and callsign recovery of low-level military targets to invention of strategies for solving the most sophisticated digital signals structures. The need for TA is undiminished, and the challenge for the profession is greater than ever.

Acknowledgment

Thanks are due to [redacted] for her encouragement and support in the making of this collection. Without the access to her files she so generously offered, it could not have been produced.

The First Quarter Century

What Is Good Traffic Analysis?[1]

ROBERT H. SHAW[2]

What is good traffic analysis? The posing of this question in these words by Mr. G. H. Vergine has raised in my mind a large number of points that while by no means original, seldom seem to be available in one place at one time. This paper is likely, therefore, to take on something of the appearance of a list. I do not apologize; I think a list is needed, and I hope that some of the topics enumerated here will be expanded in workshops to come.

1. To develop the concept of good traffic analysis, it is necessary first to be clear on the prior question of what traffic analysis is, and what its relationship may be to other SIGINT disciplines.

1.1. Historically, SIGINT (or COMINT, as it was almost exclusively at first) was initially conceived as a unified whole, the response of vaguely named communications intelligence entities to the presence of exploitable transmissions. The great growth of communications during and after the Second World War and the great diversification of techniques of transmission, encryption, keying, and read-out, led to an inevitable specialization of the analytic people, and in due course cryptanalysis, traffic analysis, signal analysis, substantive analysis, intercept, collection, computery and all the rest became, first, fields of primary concern to different units, and, later, disciplines of their own. Ineluctably, SIGINT came to be looked at as the sum of autonomous parts rather than as a conveniently divided whole; and now interdisciplinary working is something to be striven for, rather than the obvious circumstance of professional life. All these disciplines are interwoven. A traffic analyst has no vested interest in staking out a preserve of his own called traffic analysis; he has a vested interest in contributing by his own techniques to what is known through all techniques about a target.

1.2. The classic definitions of traffic analysis date from the Second World War. Typical might be that of the U.S. Navy (DNSC5, *Communications Instructions, 1944*, Chapter 4): "Traffic analysis is the obtaining of intelligence from communications by means other than cryptanalysis." This sort of early definition brigades many newer disciplines in as constituent parts of the discipline of traffic analysis and thus creates much jurisdictional controversy today. What about SIT (Special Identification Techniques) substantive analysis, and so on? What about collateral? The confusion is obvious in today's world, where efforts to restrict traffic analysis are resisted by the traffic analyst, and where the main object of SIGINT gets lost in a slather of hurt feelings and administrative slack. It is worth considering that the naming of what one does is of much less consequence than the doing.

---

1. This article was originally published as *P1 Informal No. 10* (T/A #2), dated March 1967.

2. Dr. Shaw, one of the "brightest and best" at NSA and its predecessor agencies, died in early March 1971. See the necrology in the *NSA Technical Journal*, Vol. XVI, No. 2, Spring 1971.

1.3. Technically speaking, the one set of techniques always excluded from traffic analysis is cryptanalysis. At the outset, no one was in any doubt about what that meant: it meant that traffic analysts did not try to decrypt texts of messages. Often they gave information to the people who did; often they gave information to the people who tried to solve the callsign systems; but traffic analysts were concerned with what were called message externals – everything that could be learned about a message and its many kinds of meaning by studying that message in the form in which it was uttered by the originating command or bureau. The raw material of traffic analysis is traffic: messages, chatter, callsigns, times, frequencies, signal strengths, addresses, authenticators, net structures, message lengths, precedences, plaintext transmissions, etc.

1.4. Certain of these raw materials of traffic analysis turned out in the long run to be of sufficient complexity to require the creation of subdisciplines to deal with them. Perhaps the first to come into prominence was the matter of callsigns. Endless reams have been written arguing whether cryptanalysis may sometimes be involved, but that such cryptanalysis is heavily dependent on traffic analytic identification of commands through uses of various callsigns (so-called "continuities"), and that the results of such cryptanalysis are of interest to the SIGINT producing agencies only. The mere labeling of traffic is in itself of no more lasting interest than the discovery that a dash followed by two dots represents the letter *D*. Good traffic analysis identifies continuities, and perhaps even equates them with commands; good cryptanalysis recovers callsign systems from those continuities; the resulting identifications are useful in many ways to text cryptanalysts, to substantive analysts, and to traffic analysts. The nonproducing world is unruffled by even the most brilliant results in this area.

1.5. Traffic analysis has been nibbled away at in another way: a highly automated discipline of signal analysis and SIT has grown up. Spreading from advanced collection procedures on the one hand and from advanced identification and location techniques on the other, this discipline both answers questions and asks them. To the traffic analyst it is a source of very refined raw material. He pays for it by having to pass his results back so that the procedure may be improved. Dealings among traffic analysts, signals analysts, and SIT people are also of local concern only and are valuable only insofar as they enhance the value of the information about locations, movements, actions and intentions, which is the real product of SIGINT and the ultimate justification for a SIGINT effort.

1.6. A principal function of traffic analysis is the determination of the activity of a country, or of a function of that country, by deduction from the characteristics of signals. Plaintext signals can be of considerable help in what they say, in the relationships they imply, and in the essentialia that are not said. It follows that traffic analysts should give grave thought to all the plain text they see, in headings, texts, or chatter. On some circuits there is so much plain text that it can be used as a source of intelligence in its own right, neglecting its origin. It was to deal with this situation that the discipline of substantive analysis was created and set apart from traffic analysis. The relationship of a traffic analyst to substantive analysts should therefore be that of information exchange: the traffic analyst refers a wordy circuit to the substantive analyst, who in return tells the

traffic analyst what commands, or what kinds of commands, are talking, and what those commands are up to. Once again each helps the other, and their mutual conversation in its raw form is not of interest outside the producing community.

1.6.1. On circuits only lightly involved in plain text, the traffic analyst must expect to do both jobs.

1.6.2. Particular note should be made of the great desirability of [redacted] Cryptanalysts, traffic analysts, and substantive analysts have a common interest in this project and should have equal opportunity to contribute to it. The results may show up anywhere, so that the files should be generally accessible within the producing community.

1.7. And that reminds us that people are forever telling traffic analysts something relating to their problem. This so-called "collateral" is intended to assist the traffic analyst in the interpretation of what he sees. There is a tendency on the part of many traffic analysts to busy themselves at once to confirm or deny the collateral. This rather misses the point, although occasionally it is possible and valuable to do so. Collateral is *already* known; one must not expect to make the welkin ring by repeating it aloud, even if it is not contradicted by indications in the traffic. The collateral is made available to the analyst so that something new may emerge. *Verbum sap*

2. What, then, should good traffic analysts be doing? When we know that, we can evaluate their work meaningfully.

2.1. They work toward the identification of stations and, through them, of commands. In the course of this, they may be lucky enough to uncover previously unknown subordinations (so-called "order of battle"), although there is a continuous and active danger of confusing communication with command. The real purpose of these identifications, apart from an occasional new and unexpected recovery, is.

2.2. The establishment of continuity. The purpose of continuity is to permit the following from day to day of the traffic of a known command, in order to find out what that command is up to. The study of the activities of known commands is a principal justification for traffic analysis.

2.3. There are by-products at this point, prominent by-products that have a tendency to become primary objects in the minds of analysts. One of these by-products is the material necessary to solve callsign systems. No one outside the producing community cares about this, in spite of the number of reports one sees. (Have you ever considered the probable reaction of the secretary of defense on learning that today the Second Field Army is known as 7X03? He is unlikely to declare a national holiday.) Another is the material necessary to analyze the activity of the commands. This also is of internal interest only. (Go ahead; *tell* the secretary of defense that 7X03 had 114 messages today but only 111 yesterday, and see what he says.) If consumers demand reports of such material, they are

very specifically criticizing the performance of the traffic analysts; they are, in fact, telling the producing agency that it has done an incomplete or incompetent job.

2.4. Traffic analysts should make every effort to be current. Working with the superficies of traffic, they are generally dealing in transient operation phenomena, and nothing is so old as yesterday's newspaper.

2.5. They support other SIGINT activities. They provide cryptanalysts with link data and with busts; they provide signal analysts with confirmation; they provide substantive analysts with material. They must not stop reading when they come to a BT; to do so is to create a jurisdictional stupidity which, if persisted in, can undo any meaningful understanding of the traffic.

2.6. They produce intelligence (or, in the common barbaric jargon, "intelligence information"). That means something beyond listing the raw material from which intelligence may be generated, something beyond wild guessing about the meaning of observed phenomena. (Navy readers will recall with glee the WWII TA report that the U. S. Navy had got a new, secret ship capable of incredible speed, "Heard off Cuba at 0913A, it was heard again at 1753Z at Port Lyautey; its callsign today is NERK.") It is not even the writing up of an intellectual marking signal: "We are still here, but we can't think of anything to say." Silence is golden; it takes more than gold, therefore, as openers for the silent mouth.

3. It might be said, therefore, that good traffic analysis is

3.1. *Traffic analysis.* It is not reporting, remembering, reviewing, or regurgitating. It is not a listing of phenomena. It is not the publication of intelligence of interest only to producers. It is information about the doings of organizations, information pertinent to the decision-making function of executive departments of our government.

3.2. *Defensible.* Any piece of TA output should have an *apparatus criticus* that will be fully explanatory and that will stand painstaking examination. Without it, a TA report is an unsubstantiated guess that will simply promote wild speculation and bring its originator into disrepute.

3.3. *Timely. Verbum sap.*

3.4. *Informative.* It may even contain predictions; this is greatly to be desired, if the predictions are carefully thought out and carefully justified. Predictions of routine communications/changes are, of course, beneath contempt except as working aids; predictions of fluctuation of target activity can be of the greatest value. Defensive traffic analysis predicted the Okinawa invasion and permitted the JCS to reschedule what might otherwise have been a disaster.

3.5. *Comprehensive.* The traffic analyst has the broadest scope of any SIGINT professional. His raw material is anything transmitted (except the plain texts of encrypted messages; if he can get them, he can use even those). It should never be said of a TA result that it failed to consider some known fact. A good traffic analyst, therefore, is a

person who knows how to balance comprehensiveness and timeliness: he is not panicked into publishing raw material, nor is he coerced into over-researching an item whose value lies in its immediate delivery

3.6. *Concise.* There is little to say that cannot be said in ten sentences. The footnoting, of course, can (and probably often should) take up a dozen pages, but the point of the item should be seen at once.

3.7. *Accurate. Verbum sap.*

4. What I am really suggesting is that the traffic analyst should begin each day with sixty seconds of meditation on what he is going to do, and end it with sixty seconds of meditation on what he has done. And honesty is a great virtue.

Establishing Communications Norms

P.L. 86-36

[redacted]

Communications norms can be described as what traffic can be expected, when it can be expected, and how it can be expected. The establishing of communications norms (referred to for the remainder of this paper as norms) is one of the most underrated procedures in COMINT. It is probably because the techniques in establishing norms appear so self-evident that analysts seldom "have time" to really know their target.

One might ask, why establish norms? In a period of high intercept volume and low analytic resources, it is often said, "I don't have the time – other things are more important." Well, let's take the time here and see if other things really are more important. To do this, you would just have to pin the analyst down as to what are the other things that are more important. After much hesitation and more vague and nebulous statements, you will probably find that the analyst is referring to what I'll call the production of "obvious intelligence." Obvious intelligence is what can be derived from a message after it has been converted to plain language. This is not intended to imply that obvious intelligence is not important, but frequently (too frequently) our translations do little more than provide a consumer with the same information he has either already received or will soon receive from a non-COMINT source. Somehow, competition with the press doesn't seem to be one of the Agency's objectives.

Obvious intelligence as defined above is available to anyone who can read. Once received or reduced to plain language, there is not special talent in deriving intelligence. On the other hand, there is very valuable intelligence to be derived by what is not said or in what is said in a different manner than usual. This type of information I'll call "subtle intelligence." As communications stand-downs are often the first indications of an imminent crisis, abnormal communications also have great potentials as sources of valuable intelligence. The unique and most important aspect of abnormal communications is that usually they provide intelligence not otherwise available – even by reading the messages.

Communications norms can only be established over a period of time as opposed to instant intelligence, which can be derived from reading a message. This is another reason why most analysts prefer and practice the "get rich quick" technique of rapidly searching through haystacks to find the one needle (which may or may not even be there) that will spell out "WAR WILL BE DECLARED TOMORROW." Should such a message ever be found, it would probably still be necessary to turn to a traffic analyst to find out who sent it.

While all abnormal communications may contain intelligence, it may not always be valuable intelligence. Each abnormality must be subjected to an evaluation of why it deviated from the norm. The traffic analyst would be well advised to consult other

professionals prior to reaching any conclusions as to why. At the same time, however, he should be very conscious of the fact that in the vast majority of cases he is better qualified to interpret COMINT phenomena than the consumer. He should take care to insure that his interpretation is restricted to COMINT facts.

Having discussed what norms are and why it is desirable to establish them, let's turn to how we establish norms. In the words of one of our former directors, "First there must be a signal." However, because of the restricted subject of this paper, all future discussion will be made under the assumption that the analyst is working with individual groups of homogeneous traffic.

Some care must be taken to distinguish between establishing norms and recovering technical data such as those used for TEXTA.[1] For example, a group composed of control and six outstations may appear as control and four outstations when examined from a "normal working" point of view. Likewise, certain frequencies may appear on TEXTA that would not appear on a normal frequency study. A large volume of traffic is not necessary to recover TEXTA data, but norms are established more easily, and they are more dependable with large volumes of traffic.

Since it was assumed that the analyst is working with traffic identified to case notation, recovery of calls, frequencies, etc., will already have been made and recorded on TEXTA. The analyst's job is now to determine the normal working. The different types of sorts in which the traffic can be put are numerous, and it would be beneficial to investigate various machine programs to do the bookkeeping.[2] Short of using a machine program, however, a good basic approach is to put each case in date order. A further breakdown of time within date is helpful and often recommended in training manuals, but past experience has revealed that the benefits gained are usually not as great as the cost in the additional time required. Specific norms are not established with the same degree of ease, and the types of sorts and logs used are dependent upon what norm(s) the analyst is attempting to determine.

Initially, traffic from each case notation should be examined separately. A log listing date/time of intercept, frequency, and actual contact is a good start. Having logged the above information, the analyst should begin analysis of the logs in an attempt to answer questions that would enable him to determine the norm. The specific questions to be answered are limited only by the imagination of the analyst, but discretion should be used to insure that the answers to each question will be worth the effort required to find out. The above-mentioned discretion is a very important ability of an analyst. Intelligence of some sort can be obtained from every bit of information, but its value is a factor of the probability of the occurrence of the conditions under which it will be useful. In other words, don't analyze solely for the pleasure derived in performing analysis.

P.L. 86-36
EO 1.4.(c)
EO 1.4.(d)

1. TEXTA means Technical Extracts of Traffic Analysis. A system of recording and maintaining a database of technical information on communications targets.

2. Traffic Analysis Processing System (TAPS) and TANGERINE.

First, let's look at some of the items that can be determined by looking down the date of intercept column. A simple visual examination will reveal any "missing" dates during the period being examined. The missing dates will often show a pattern. A common pattern is no traffic every seventh day, and a comparison of the pattern and a calendar will probably reveal that the missing days are Sundays (or whatever day of the week the people of the target country consider the Sabbath). Don't be concerned if there are no missing days of intercept; communications of more advanced targets are active seven days a week. Either way you have just established your first norm – the group normally operates seven days a week or the group normally does not work on Sunday. At this point the analyst is cautioned to make sure he understands the working of his intercept source. This common pitfall can best be illustrated by the analyst who had established the norm that the group he studies operated only five and a half days a week closing down at noon on Saturday until Monday.

PPLL 886386
EE001144(¢¢)

Examination of the time of intercept column of the log will show the normal hours of operation and schedules. Once again as mentioned above, care should be taken not to recover the intercept source's hours of operation. Often the difference between the time the group begins operation and the time it stops is the same as the hours of a regular day's work or at most maybe sixteen hours a day (two eight-hour shifts).

Schedules are not as easy to establish as hours of operation. The main reason for this is that rarely does the analyst have the benefit of cast-iron coverage. A good intercept operator often makes up for sparse cover. He notes when he hears his target, and the next day he will usually be looking for that case at the same time. This results in the same approximate time being recorded for several days in a row, and it also establishes another norm. The other side of the coin is also true, however. Certain elements in collection management in our agency have caused a great deal of emphasis to be placed on the "productivity" of our intercept positions. Often this results in undesirable pressure being brought to bear at the source of intercept. In their efforts to make their positions productive, analysts spend less time searching for new schedules and placing more and more reliance on the few already recovered.

Another hindrance in establishing schedule norms is that operators at sites will often copy only "messages." Several receivers are used simultaneously and known schedules are checked out, but unless a message is being passed there is usually nothing to indicate to the analyst that the group was active at such and such a time. The disadvantage here is twofold. First, while the intercept operator may know when to look for a certain group, the odds are high that the analyst is not aware of the schedule. Second, after the norm has been established, a missed schedule by the target (which should have high intelligence value) would appear to an analyst exactly the same as the group coming

up on schedule but not passing a message (probably of no great intelligence value) and therefore heard but not copied by the intercept operator.

Schedules are much more difficult to an analyst than they are to the intercept operator. Often a good tech exchange letter to the source expressing the analyst's views and asking specific questions will help establish schedule norms very quickly.

Analysis of the frequency column of the log will increase the list of norms, which should be getting fairly large by now. The frequency normally employed can be easily determined by visual observation, but to establish norms beyond this, it is usually necessary to analyze the frequency column in conjunction with the date, time of intercept, and/or call-up columns. The same is true of the call-up column. In isolation, analysis will show only those stations that are normally contacted, but these norms can be refined greatly by further analysis between two or more columns of the log.

With relatively little effort so far, the analyst has managed to build up quite a set of norms. The log can now be expanded to include message headings and a column for type of traffic. The columns to be used for the message headings will vary, but almost all will include message number, precedence, date/time of origin, addresses, originator, and group count.

Without going into the detail given in the first part of the log, it should be noted that certain norms can be established by analysis of each column in isolation, but the possibilities are almost unlimited when analyzing each column with one or more other columns.

As was stated earlier in this paper, different norms are established with varying degrees of difficulty. There will be absolutely no doubt about the validity of certain norms. Others may be questionable, but the exercise of trying to establish norms will allow the analyst to identify those areas that need more intercept and analysis. This should result in better tech exchange and support and thereby make better use of collection resources.

Once the norms have been established, the analyst can quickly scan the daily intercept (without logging) and with a high degree of confidence separate the small percentage of abnormal traffic. The remainder of his time can be sent interpreting the abnormal traffic and thereby coming up with valuable unique intelligence.

P.L. 86-36

[redacted] in a lecture to our senior intelligence class, once said if he had three wishes they would be (1) to know everything in the world, (2) to be able to report it to parties capable of doing something about it, and (3) to have them believe it. Establishing good communications norms will enable to traffic analyst to continue to provide the intelligence community with unique intelligence when the linguist and cryptanalyst are truly stumped. At his point, the problems are just beginning as we are faced with the problem of "having them believe it," but, oh, what a wonderful problem with which to be faced.

Chatter Patterns: A Last Resort

WAYNE E. STOFFEL

A possible method of identifying radio operators by their reaction to standard situations occurring in chatter, for use when conventional techniques fail.

BACKGROUND

The success or failure of most traffic analysis problems depends primarily upon the analyst's ability to achieve continuity.[1] Simply defined, continuity involves bridging a communications change by equating a given element appearing before the change with a different element appearing after it. The term continuity refers to the discovered relationship between the given element and its replacement, *without reference to the underlying meaning*. For example, we may by various methods discover that callsign ABC during November was replaced by DEF during December, and thus achieve continuity from ABC (November) to DEF (December). Note that the time factor is intimately involved in the relationship between ABC and GHI is more accurately termed an equation or co-location and is not a continuity in its pure sense. Continuity can exist between ABC and DEF without any knowledge of the location, identity or function of ABC or DEF. The importance of the distinction between continuity and other forms of equation lies in the fact that once any knowledge is gained about ABC, it automatically applied to DEF (and vice versa). If we discover that ABC served the Chief of Staff, 12th Division, Greenville, for his contacts with subordinate regiments on the Division administrative/logistic net, this information applied to DEF, in toto. On the other hand, about GHI we can only say (with any certainty) that it is located at Greenville. (Depending upon the type of equation made between ABC and GHI, we may further be able to say that GHI also serves 12th Division *or* that it also serves an administrative/logistic function).

A direct cryptanalytic analogy to continuity can be recognized by considering a simple substitution system involving a matrix with changing coordinates. For example, the following matrix has been recovered for 1 April:

1. A number of countries today go to surprising lengths to suppress in their communications system distinctive characteristics that might serve to disclose their identity. Among the more common methods of suppressing characteristics is that of frequently changing certain communication elements, such as callsigns, frequencies, schedules, procedure, routing, and address symbols. Since it is often necessary for the traffic analyst to study several months of material on a given net before concrete intelligence results can be developed, and since communications elements may change as often as twice each day, he must, somehow, find a way to nullify the effect of these frequent changes in order to pull homogeneous material together for study. He may note certain characteristics that do *not* change frequently (for instance, that a given station sends a distinctive service message each day at 1100), which can serve as identifying features. When he is successful in nullifying a communications change, the traffic analyst refers to the result as *continuity*.

On 2 April, assumption of the probable word "**ATTACK**" yields.

47	23	23	47	63	55
A	T	T	A	C	K

	7 5 - 3 - - -
4	A D R L • • •
6	P B O C
2	M - E T
5	- K N -
•	•
•	•

It can then be stated, if the assumed word "**ATTACK**" proves correct, that row coordinate 4 on 2 April *is continuity of* row coordinate 2 on 1 April. It can also be shown that cipher value 57 on 2 April *is continuity of* cipher value 14 on 1 April. In this second case, we have achieved continuity without knowing what the actual plain value is. Finally, we can say that cipher value 43 on 2 April is continuity of cipher value 28 on 1 April. In this instance, when 43c (2April) = 28c (1 April) is proved, and 28c (1 April) = Lp, then 43c (2 April) = Lp.

The more frequently an element changes, the more important continuity becomes (since it is virtually the only consistent method for achieving enough depth on a given element so that a study of its underlying nature and purpose can be undertaken), and the harder it is to get. Most of us can sympathize with the unfortunate analyst whose formerly stable problem suddenly adopts twice-daily changing callsigns, frequencies, addresses and discriminants.[2]

On problems involving fast-changing elements, continuity is usually achieved by means of whatever characteristics are available that can be trusted to be unique. If many are available, the easiest, fastest or most economical methods are, of course, tried first,

2. Traffic analysts will recognize that, for the sake of simplicity, the complexities of the various classes of equations and their accompanying validations have been avoided in this presentation. Other readers are warned that many validities have been avoided in this presentation. Other readers are warned that many a "Donnybrook" can and does develop between traffic analysts on these very factors.

while the more intricate and time-consuming methods are held in reserve for tough cases. It often happens that certain nets develop a stubborn streak that defies description (in mixed company) and, despite application of the most time-consuming routines, manage to remain intact and featureless.[3] Where all else has failed, the analyst may well find the following proposed routine useful.

INTRODUCTION

Most people are creatures of habit, particularly when performing a routine task, and radio operators are no exception. There have been considerable experimentation with and study of the variable characteristics of a Morse operator's transmitting habits or "fist" in an effort to develop a systematic process of recording and analysis which would permit ready recognition of the individual at the key. There is, however, a large area of variable operator habit which has remained virtually unexplored during recent years: habitual operator characteristics as displayed in routine chatter exchanges.

A good many traffic analysts can recall a specific instance where a unique or rare procedure signal was consistently used by a certain net or station and, in the last resort, could thus be relied upon to identify its user. There may be few, however, who can recall conducting a comprehensive and systematic search for such characteristics in order to achieve continuity and identification.

What follows is an outline proposal for a routine of systematic search for unique chatter or conversation characteristics that can be used for continuity or co-location purposes. For the most part, specific details are avoided except for examples, since they will vary from problem to problem. It will be seen that the routine is not readily usable on large problems, and may, in fact, be suitable only on limited problems where the area of inquiry is relatively small and all standard methods of achieving continuity have failed. An obvious prerequisite would be a significant volume of activity transmitted by the stations under study, with some assurance that a fairly complete (preferably verbatim) copy of chatter has been recorded by the intercept operator.

BASIC ASSUMPTIONS

It can be empirically demonstrated that regardless of the degree of conformity enforced by the target's COMSEC service, different operators use different operators use different combinations of procedure signals to express the same ideas, but that each operator tends to be consistent with himself.

3. This situation tends to exist to a greater or lesser degree on most problems, although it can can be appreciated that the point is ordinarily glossed over in discussion unless the words "additional personnel" are injected into the conversation at a suitable point.

The writer's contention is that these habits are more widespread than is generally supposed and that, under admittedly special circumstances, a systematic routine will disclose a sufficient number of them to permit continuity to be developed.

Expert chatter readers will recognize that operator chatter must be treated as a distinct, albeit peculiar, language.[4] Despite the best intentions of the signal officer who compiles an extensive set of procedure signals for radio operations, the "plain" side of his "code" is generally restrictive. In actual operational use, a given procedure signal (prosign) tends to lose its rigidity and takes on a more general *concept* or *idea* form (particularly where it is used so often as to be easily recognized without "looking it up"). Thus the prosign QTR can be shown to have the fixed meaning ("The correct time is – hours"), whereas in actual usage among experienced operators, it embodies the general concept of *time* and is so used in a wide variety of contexts.[5] Complementing the tendency of experienced operators to generalize prosign meanings is the equally strong tendency to minimize and abbreviate words and prosigns in order to conserve both time and energy. "Ham" chatter displays this quite clearly.[6] It is not difficult to visualize how a relatively isolated segment of a radio network could gradually evolve a "local dialect" distinct from that of the rest as a result of improvisation under these pressures. Certainly a regimented COMSEC system with a firm domination over the radio schools could suppress some of this variation, but if we confine ourselves to studying experienced operators, it is likely that some recognizable variance and individuality will occur.

A SAMPLE PROBLEM

If distinctive operator habits do, in fact, exist, how do we go about finding and recording them? Evidently, if a way can be found to catalog the *situations* that confront a radio operator most frequently, we can collect his *responses* to any given recurring situation and by observation determine whether his reaction is fixed by habit or is variable. For example, we might select as a favorable starting point several hours of intercept between station A and station B during which a number of messages were sent by each station. As a recurring situation, we might select *message transmission* and further restrict our examination to the station responses during the period immediately before starting each message. We might find

4. A more precise analogy has been suggested that compares chatter to a codebook usage wherein (a) the vocabulary is not precisely suited to the material being encoded and (b) the code is large enough so that code clerks tend to use combinations of common, memorized groups in preference to rarer but more precise and economical groups that must be looked up each time they are needed.

5. For example, the interrogative for "QTR?" is listed as "What is the correct time?" The prosign QSY means "I shall send on ___ kilo[hertz] and its interrogative form (QSY?) is interpreted as "On what frequency shall I send?" or "Should I change frequency?" The compound "QTR QSY?" may well be used to mean "When should I change frequency?"

6. For example, the prosign "CUL" is a "Ham" contraction of "See or contact you later."

Example 1

A: *QTC*	(I have traffic for you.)
B: GA	(Go ahead.)
A: C AS	(Yes, stand by.)
B: C	(Yes.)
A: BT	(Break Sign – attention, etc.)
A: NR.....	(Goes into preamble.)

Examination of the same basic situation a short time later when station A was again about to transmit a message showed that after receiving "GA," station A again said "C AS" (Yes, stand by) and after receiving the affirmative from the other end began his transmission with a break sign. A third message still later in the same schedule begins with the same exchange, and it now begins to look as if we have found a starting point.

A quick look at the activity of station B shows that the two messages it sent were also preceded by identical chatter exchanges.

Example 2

B: QTC AAA	(I have an "AAA"[7] message for you)
A: AS	(Stand by)
B: C	(YES)
A: GA	(Go ahead)
B: C AS	(Yes. Stand by)
A: C AS	(Yes. I'll stand by)
B: C (pause) BT	(Yes. Break sign – attention)
(Then into preamble)	

Let us now examine what we have so far in the way of possible habits:

(a) When *offering* a "QTC," both station A (Example 1) and station B (Example 2) sent "C AS" after receiving "GA" from the other end. Each then preceded the preamble with "BT," but station B (Example 2) used the compound "C (pause) BT."

(b) When receiving a "QTC," station A (Example 2) responded with "AS" before giving the "GA," while station B (Example 1) gave "GA" immediately. When responding to "C AS," station B (example 1) gave the brief answewr "C," while station A (Example 2) used what may be a variant form – "C AS."

Later the same day, another exchange of messages is found between stations A and B. During this later schedule, two messages from station A are preceded by

7. "AAA" in this instace refers to type or priority of message (e.g., "2nd priority" or "service").

Example 3

A: QTC
B: GA
A: C (pause) VVV QTC
(goes into preamble).

and one message from station B is preceded by

Example 4

B: QTC
A: GA
B: C AS
A: C
B: C (pause) BT
(goes into preamble)

It is quickly seen that the behavior of station B is essentially unchanged but that of station A shows no parallel with what went before. Our choice at this point is quite simple – either station A has changed operators or the "habit" is not sufficiently strong. The resourceful analyst would study carefully the chatter exchange during the opening of this second schedule for any evidence of a new operator at station A (extensive tuning, authentication, etc). If the "new operator" hypothesis does not appear sound, other types of habit must be sought. On the other hand, if it *does* appear sound, examination of suspected continuities from previous or successive dates should show whether the time of change is fixed (i.e., the end of one duty tour and the beginning of another). It would appear that once the duration and change times of operator shifts can be established, analysis can proceed at a much faster rate, since the change times will allow the analyst to sort activity for any given date into tentatively homogeneous groups.[8]

Thus far, our accumulated results are far from impressive. Where can we look for other habits? Two situations obviously related to the one examined above would be the area immediately following the message (message closure and receipting exchange) and any "in-text" servicing (receiving station interrupting to ask for repeats while the message is still being transmitted) or "post-text" servicing (after the message is finished but before receipt is acknowledged), but there must surely be other areas that could be equally profitable.

TYPICAL SITUATIONS

We may find it useful to consider a typical schedule between two stations and examine the successive situations that confront the radio operator. Since certain of these will tend to recur within the same schedule (e.g., opening traffic, as in the example above), while

8. Some care must still be exercised in watching for cases where extra operators are put to cope with heavy traffic volumes, or for any other situation having the same effect.

others by their very nature will tend to occur only once in any given schedule, it is convenient to distinguish between the two *types*, since the former is much more useful as a starting point (one is bothered less by possible operator changes, and only one schedule is generally needed for initial isolation of a tentative habit) while the latter comes into use, for the most part after some initial foothold has been achieved. For purposes of convenience, we shall call the former *primary* and the latter *secondary habits*.

2. Tuning

Immediately after initial contact, various adjustments of tone, power, and frequency must usually be made before reception is considered good enough for the transaction of business. The exchanges may range from a short, terse and businesslike operation to a long, temperamental and often humorous argument. Unless they occur frequently, these longer-winded battles are of little use to the type of study being described,[9] and attention should be concentrated upon the shorter and more lucrative exchanges.[10] The first schedule after a frequency change usually contains much more tuning chatter than do subsequent schedules on that same frequency.

3. Recognition

Recognition exchanges may occur with or without a specific system such as an authentication chart or table of challenges and responses. They are most often seen on the first schedule after a new operator comes on duty, although some signal plans seem not to require their use unless messages are to be exchanged, while others obviously specify such use on every schedule. Many experienced operators prefer to rely on aural recognition of "fist" characteristics and frequently ask the other end to "send V's" (QSV) or adopt *some* other device toward the same end.[11]

4. Opening Traffic

The exchanges treated in some detail (see examples 1-4) may be preceded by statements from *both* operators that they have traffic to be transmitted. In this situation, agreement must be reached on an order of transmission, and such an exchange may be a good source of secondary habits.

5. Preamble and Text Handling

This category embraces a wide variety of characteristics, some of which are generally recognized as useful. In order to find *operator* habits, one must recognize that the operator

9. Except, of course, for the laudable purpose of recreation.

10. In analyzing these exchanges, it is useful to remember that frequently the operator does not have direct access to the transmitter itself and must relay adjusting instructions to a remote transmitter site by telephone.

11. This use of QSV should not be confused with the more extensive use during tuning or equipment adjustments. When the sending occurs early in the schedule, it is not always easy to distinguish between the two, but its use in the recognition sense is usually unmistakable when, during later operations, consistent mis-encipherment of procedure, etc., arouses clearly recognizable operator suspicions about an operator's identity.

is here working from a printed or written record, so that the order of preamble elements, for example, is controlled (in most problems) by their arrangement on the message form while breaks and separators may generally be attributed to the operator himself. Here also belongs the situation where the operator realizes he has mis-sent a portion of the text, sends an error sign, and corrects the mistake. In this category, one is most definitely at the mercy of the intercept operator, and one is likely to find him completely absorbed in copying the text (to the exclusion of nontextual transmissions).

6. "Break-in" Servicing

The receiving operator, under signal instructions, is allowed to "break-in" during text transmission to ask for verification or repeats of certain passages which he has missed or which seem doubtful. Where this happens (and where the intercept operator provides a verbatim record of the exchanges), primary characteristics may be found, since a number of prosigns are usually available for use in this situation, and requests for repeats can and do take several forms.

7. Closing Traffic

Most signal instructions will provide for some prosign such as **BT**, **BK** or **K** to mark the end of text, but some operators use additional compounds for emphasis, or to remind the other end that there are still more messages to be transmitted. As special case, traffic sent by broadcast methods is usually sent twice, and the procedure used to separate the two consecutive transmission frequently shows strong habit patterns.

8. Post-Message Servicing and Receipting

From the transmitting operator's point of view, a given message has not been "cleared" until the other end officially receipts for it. If the other end is not satisfied that his "copy" is correct, he will not give a receipt (**QSL**) until he has verified the questionable passages. Although the situation is slightly different from that described in "Break-in Servicing," habits found in one situation would be likely to show up in the other. As a special case, servicing may be asked for during a later schedule and, if it can be shown that the message has already been "cleared" (i.e., that a **QSL** was given), this "late" servicing may well result from an inability to decrypt the message.[12] The servicing request in this instance may differ from "break-in" or "post-message" servicing only to the extent that the involved message must be clearly identified (i.e., by serial number or other unique indicator).

9. Breaks, Waits, and Interruptions

We are here concerned, not with pauses that appear to be a fixed part of habits rising out of other situations (i.e., the pause before message transmission as shown in the first examples above), but rather with the nonroutine or unexpected interruptions that cause temporary or permanent breaks in a given schedule. Among the situations that can be

12. Such information might be particularly useful to the cryptanalyst.

expected to produce habitual responses [13] are intervention of other schedules, equipment failures, interference, operator changes, shortage of transmitters and interruptions by other stations.

On especially long waits, the transmitting operator may key certain characters or compounds to "hold" the other end, in the general sense of "Hang on, I'm still here" or "Keep listening, I'll only be another minute or so." The actual signals sent during this "hold keying" may well be unique to each operator, but again we are dependent upon verbatim intercept copy if this characteristic is to be used.

10. Next-Appearance Discussions

Once the business of a given schedule has been transacted and the schedule is about to be terminated, some mention is usually made of the next appearance. Where contact times and frequencies are predetermined by the signal instructions, this mention is not likely to exceed a very perfunctory "Watch for me; I'll watch for you." On the other hand, the discussions may well involve times and frequencies. Either situation will yield useful secondary habits. As a special case, satisfactory contact may not have been achieved, and ensuing discussions about another time and frequency may yield significant habits if the situation recurs.

11. Sign-Off

The actual termination of a schedule frequently involves a little ritual that is difficult to describe to one who has never heard it. Between operators who are used to working with each other, it is usually fairly rapid and highly stylized.[14] While this area should not be ignored as a source of habits, a departure from the routine specified in the signal instructions is frequently the result of tacit agreement between *both* operators and must be treated accordingly.

12. Special Circumstances

The above categories obviously do not complete the list of situations which may be useful on any given problem. If the net under examination regularly changes frequencies in midschedule, the chatter exchanges before and after each change merit some observation. Another special case involves the use of a matrix or table for prosign encipherment. Aside from the obvious benefits such a system can provide where local usage makes it effective for net or complex identification, the *use* of each *cell* in the matrix can be likened to the use of a comparable *prosign*. Thus, habitual use of certain cells or the formation of various compounds is just as useful as the prosigns themselves. This principle

13. Obviously, interruptions caused by flood, fire and other emergencies cannot be expected to appear often enough to be a fruitful source of habitual responses.

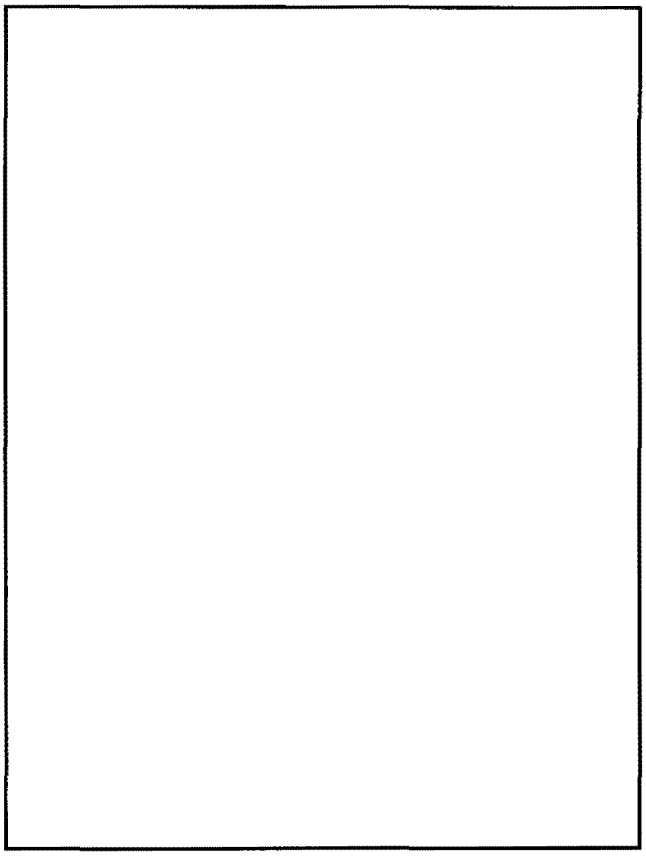
14. A typical exchange sometimes used by U.S. personnel, where conformity to COMSEC regulations is not rigidly enforced, involves the transmission EF (dit, di-di-dah-dit) and the answer EE (dit, dit), which approximates the rhythm of the familiar "Shave and a haircut..."

also applies to related systems, such as authentication, wherever habits can form as a result of allowing the operator a free choice in selection among a number of variables.

CONCLUSIONS

It will be evident that the proposed approach to maintaining continuity through chatter analysis has application only in limited cases. Because of its complexity, it may well be attempted only as a last resort and would undoubtedly require the services of a skilled chatter reader.

P.L. 86-36



On some problems, one or two distinctive habits may be sufficient, while on others a wide variety of situations may need to be examined before individual operators can be distinguished. It may be found useful, when looking for habits, to keep a similar running record of those responses *which are the same for all operators*, on the theory that such responses have been specified by the signal instructions or form a "local dialect." Such a list would be helpful in later examinations of a related net or complex, since it would define situations where habits are *not* likely to be found. (It might also become a useful *net identification* tool.)

It should be emphasized that the "habits" we seek in this approach are not tendencies to act in a given manner, but are more nearly instinctive reactions or reflexes to recurrent stimuli. Where these reactions are found to be quite variable, it may be assumed that the operator concerned lacks sufficient experience to have developed such habits or that the situation is rare enough so that he has not developed a reflexive response.

The approach may be useful, not only for continuity development in selected areas, but for inter-net equations after other evidence has narrowed the area of search to reasonable proportions, and to bridge communications changes where continuity is available both before and after, but not across, the change.

A Note about NRs

P.L. 86-36

[redacted]

A number range is an NR range, or so I have always thought. It is, of course, useful in recovering continuities and colocations, and the rate at which its member numbers are used up gives a relative measure of the tempo of activity of the user of the NR range. Recently, however, several interesting anomalies in NR usage on the Vietnamese Communist (VC) problem have triggered some thoughts about the behavior of NR ranges.

I recall sermonizing about my conviction that fewer errors occur in the NR (you may read "Radio Station Serial Number" for NR throughout this article) than anywhere else in the message. Errors, in this context, are those committed by the *target* and not by our ability to perceive what was sent (i.e., not intercept, or logging, or forwarding, or machine errors on *our* part). The argument underlying this belief centers on the use of the NR as a control or reference number: one refers to a message by means of that NR. Any ambiguity or conflict would cause difficulties in even the most primitive filing system. For that reason, one can imagine the keeping of a log book; each sheet of the log could have, down the left side of the page, the string of consecutive numbers that will become NRs as each message is logged onto the sheet. A neat, pretty picture – but not always correct.

In the course of looking at one particular VC NR range, it became apparent that, from time to time, *duplicate* NRs on consecutive messages did occur. At first, each instance was attributed to an intercept or recording error on our part, but in some instances the messages were re-sent on later dates with the same offending duplicate NRs. There is at least one explanation for such duplicates. The VC evidently do not like to send long messages and usually break up long texts into short messages of roughly 75–100 groups. Each part then gets its own NR and group count, and one of the parts will carry the file date and time for the whole batch. We might see five consecutive messages, only one of which carries a file date and time; it is as if all five messages were block-filed at one time. It seemed significant that none of the duplicates were *within* one of these batches of messages. Where duplicates occurred, they were invariably between the first message of a batch and the message preceding it. Often the earlier member of the duplicate pair was a single message filed late in the evening (later than the "typical" file times for that station) and carrying a high precedence. From time to time, we have captured radio station documents, and one frequently encountered is a small log book that is a rough diary of schedules met, significant (to the VC operator) chatter, and message preambles sent or received. Where duplicate NRs have occurred, it seems possible that the first message, carrying high precedence and needing to be sent out "after normal hours," simply was not logged in properly (such things have been known to happen around here, too) or that no log, as such, was kept at all by the station – the activity log book contained all preambles and could easily be checked to see what the next unused number should be. The pages of

these books are quite small, and the last previous message would often be logged on some earlier page. Instead of logging in, say, NR 76 on the line immediately below the entry for NR 75, in a formal NR log, one might simply leaf back through the activity log book for the last outgoing message. It would be easy to miss the entry of a single message, if most message entries contained strings of from five to fifteen messages, or if the message was not properly logged in. Thus, in the example, the leafing back for the last-used number, NR 75 might be missed, either because it was only a single entry and easily overlooked or because it was mishandled after hours and perhaps was not even logged. In any event, it seems clear that a *separate* NR log was not being maintained at that station.

Another aspect related to how the NR log was kept was evident in the circular NRs of one station: he used the block 100–399 to one set of outstations and 400–699 to another set. Each time one or the other ranges reverted, it was evident that the station was undecided about whether the ranges began at 100 and 400 or at 101 and 401. Over a long period, both starting points were used about equally often. Clearly, no preprinted logs could be the basis for such indecision. It could be accounted for either by the small operator log mentioned above or by a *blank* NR log (i.e., not preprinted with numbers).

A third "happening" seems, at first glance, to clash with the behavior described above. On 1 January 1969, the station that had been using the 100–399 and 400–699 circular series changed a number of aspects of its operation, including its NR patterns. In particular, both of these circular ranges were replaced by 1–100 ranges. In one circular series (but not the other), the number 44 was omitted. The omission is easily proved, since other serials occur in crypt indicators that do not omit 44. On the face of it, this could be explained by assuming that the station used a preprinted log containing an error in it. And that may indeed be the real explanation. But there is another possibility. Many of the VC documents captured and turned in to us for study bear the unmistakable signs of repeated usage. VC units in the field are short of paper and have learned, by writing lightly with pencil and later erasing, to stretch the life of each available scrap of paper. (Whether this fundamental difference between VC and U.S. methods has had any impact upon the course of the war will be left to historians and philosophers to debate.) It seems at least possible that some sort of log was kept during the *first* "pass" from 1 to 100, during which 44 was omitted in error. When the series reverted to 1, out came the trusty eraser and all but the NR was erased on each successive line as needed.

An NR range is an NR range, and its principal uses are still related to continuity, colocation, and tempo of activity. But subtle variations in *how* the range is used may, now and then, give us a little insight into the activities of the humans who use the NR range. All this presumes, of course, that the target country has not yet extended its COMSEC activities into the area of NRs.

Some Thoughts Concerning Traffic Analysis Mechanization

ROBERT S. BENJAMIN

Paradoxically, traffic analysis mechanization *will save manpower* but should not decrease and may even increase the amount of "real" traffic analysis work that remains to be done. NSA and the cryptologic community have always had far more things to do on most analytic problems that could be done with available human resources. Many of these things that have to be done prior to important analysis have, in the past, involved hours of logging, summarizing, counting, verification, some degarbling, and other similar operations. These are the things that machines can do best – once material is in a *machinable medium* that permits its being fed to a computer for automatic data handling. On the other hand, only people are capable of assessing the *meaning* of the various phenomena discovered in the process of organizing and reducing the data.

The scope of traffic analysis ranges between the first recorded results at an intercept station and the issuance of SIGINT end-product reports that detail traffic analytic findings in a form suited for intelligence consumers. Practically anything that goes on in the long series of complex processes between antenna and product, wherein "data" (signals) are gradually being transformed into increasingly meaningful information, is of concern to the traffic analyst. The traffic analyst works with signals collection people in directing intercept cover; he stands ready to assist the cryptanalyst in the latter's efforts to cryptanalyze message texts; he writes end-product reports for intelligence consumers or contributes basic data for integration into such reports. He works similarly with a multitude of other experts in various other SIGINT and COMSEC specialties.

The nature of traffic analysis is going to change; the change will come slowly at first, but we will be shifting gears in the next few years, and we must be ready for it. Material will be coming to us in predigested form – the more clerical parts of our job will in the near future be done to an increasing extent by machines. And we must develop and exchange ideas concerning the new working methods now appearing. A deeper order of creative thinking will be called for. Once mechanization systems are begun and databases are established, the use to which the data are put will be limited only by the imagination of those using the particular system. The *manual* part of analysis will be done more and more by machine; the *mental* part must be done by people.

SHOULD ANALYSTS LOOK AT HARD COPY?

People faced with machine output in one of its many forms often wonder whether they should continue to examine hard copy intercept. The answer to this question depends on a number of considerations – two, principally:

a. Hard copy should be examined until the analyst convinces himself of the accuracy and utility of the machine product.

b. Hard copy should be examined *if and only if* there is a real advantage to be gained.

A complete version of the intercept will probably have to be available for "back-up" use in many instances - just as the New York telephone directory must be available even though one doesn't read it page-by-page. This "back-up" traffic may be in hard copy, microfilm, or in a machine recorded form, and should be retained for a reasonable period. It should be available for emergency use to permit analytical reentry into traffic external systems (callsigns, etc.) when the machine "digests" are insufficient and to permit occasional spot checks of the efficiency and reliability of the system.

One thing is sure–extensive recopying and counting from hard copy should *not* be done. Summaries will be prepared by machine, as will detailed files concerning data elements and data items under consideration.

The traffic analyst is no longer limited to the traditional "sort and list" output of traffic analytic data. Machine output now may be in many other forms. To cite a few examples: summary listings (prints), printed matrices (coordinate tables of various kinds), printed "net reconstructions," decks of punched cards with "interpreted" (printed) information on them, answers received at a remote inquiry station (electric typewriter) communicating with a data bank in a remote computer, and "soft copy" displayed on a scope resembling a television screen (which may be photographed, if need be). Every few months, new forms of useful output seem to be appearing, resulting from computer industry developments, and from cooperation within NSA between so-called "machine people," R/D people, and analysts.

LARGE PROBLEMS VS. SMALL PROBLEMS

All those techniques of traffic analysis that depend upon collecting, summarizing and analyzing masses of data for achieving answers will lend themselves to mechanized treatment. But creativeness and judgment will be necessary

a. to design the logic for the mechanization in the first place,

b. to interpret the results obtained from machine output,

c. to improve and extend the capabilities of the particular system by discovering new ways to use it and new ways of producing even better information, and

c. to know when to go to hard copy intercepted traffic for answers that the machine system cannot give. Hopefully, proper interpretation of machine output will give a good part of these answers.

The one-of-a-kind type of occurrence is trickier and does not lend itself to machine analysis so readily. Such an occurrence may be recognized by a human being at an earlier point (in the field, for instance) and appropriately indicated, tagged, or reported in some suitable reporting medium. Or a scan of the hard copy material by an analyst *knowing what to look for* and taking fullest advantages of what has already been done by machine, may show up one-of-a-kind occurrences that may be significant. Whether a "hand scan" of hard copy will be profitable will depend upon the target, the requirements, and the circumstances.

The very, very small analytic problems are often cited as examples of things that need not be mechanized. This remains to be seen. Even in these small problems, however, certain data are necessarily a part of overall SIGINT requirements for coverage accounting reasons and must be mechanized. To the extent that an analyst can profit from what is already being mechanized, so much the better.

PENDING DEVELOPMENTS

There is a need to apply to traffic analysis methods like those called "management by exception" techniques now used in mechanized data handling in the business world. However, before such "analysis by exception" techniques can be used, norms must be established so that the computer can recognize occurrences or phenomena outside these norms. Admittedly, the establishment of norms is not an easy task. Machine scanning and selection methods involving the search for material containing certain desired "words" or the elimination of material containing unwanted "words" are a class of "exception" techniques.

Many people are working on developing many projects that relate to traffic analysis mechanization. Some projects that come to mind are

STRUM (Standard Technical Report Using Modules)

TAPS (Traffic Analysis Processing System - a flexible family of programs)

TIPS (Technical Information Processing System)

SPECOL ("Special Computer Oriented Language" – an experiment in data correlation and retrieval)

TEXTA Mechanization

ZITO (produces soft copy of a scope)

AG-22 (Paper-tape producing typewriter).

TRAPEZE (System to produce formatted reports from AG-22 paper-tape output.

Each of the above projects is significant enough to deserve being treated at great length, but that is beyond the scope of this article. And there are many other important projects that could be mentioned.

We urge individual analysts to learn more about machine processing. The National Cryptologic School offers several excellent courses to introduce the "layman" to the general idea of using machines, and other such courses will be devised in the months and years ahead.

Learning a programming "language" is another way to gain familiarity with machines. These so-called "higher programming languages" are machine-independent in that *compilers* are available that enable programs that have been written using these languages to be run on different computers, even computers made by different manufacturers. FORTRAN is one such language, but FORTRAN lends itself more readily to mathematical computation than to the handling of traffic analytic data. Showing more promise for data handling is COBOL, a language designed for business applications, which can handle alphabetical as well as numerical information. Courses in either of these languages can provide the traffic analyst with a good conceptual base. There are other "programming languages" in existence, or being developed, that are suitable for information handling.

As TIPS Pilot is developed, simple formatted interrogative statements through a RYE remote station will enable any analyst or manager to ask a wide range of questions and get rapid answers from the RYE computer concerning information in the TIPS files. Subsequent versions of TIPS – TIPS I and TIPS II (TIPTOES) – will add many refinements in future years.

However, analysts need not learn computer programming to use mechanization, but they should become familiar enough with machines to feel comfortable when confronted with the idea of mechanized data. Machine prints will not look like conventional "hard copy," but they will spare the analyst many, many hours of drudgery and permit him to spend his time really analyzing and synthesizing. Whole new areas of techniques will open up; for example, machine prints of TAPS output have shown phenomena not at all readily apparent in the hundreds of input entries that were combined, reduced, and presented to analysts in summary form. Interpreting these phenomena calls for a high order of thinking and judgment.

In summary, analysts on analytic problems that aren't already using machines should be exploring ways to use them, particularly since STRUM, AG-22 and the like will soon present a machinable input for practically all problems. And, of course, machine people need to know more about traffic analytic problems; at best, it isn't easy to dredge meaning out of the mass of confusing data facing the traffic analyst, and the more that machine people understand this, the more help they will be to this important aspect of SIGINT production.

Acknowledgments

I should like to express my appreciation for the review and helpful comments by Mr. James Taylor, C4103; Mr. Robert Grove, C416; Mr. George Hicken, C03; [redacted] A03; and Dr. Walter W. Jacobs, E.

Cleaning the Augean Stables
or
How Much T/A Can a Computer Do?

FRED MASON

One of the labors of Hercules was to clean the stables of King Augeas. These housed three thousand very healthy oxen and hadn't been cleaned in twenty years. Rather than trying a shovel, Hercules was smart enough to turn two rivers through the stables.

T/A has a comparable task. Manually, T/A is a desperate attempt to clean up the constantly augmented flood of intercept, in the belief that there may be one or more valuable needles in the original haystack. And the collectors are so damned healthy!

The computer seems to offer a way of doing it by dropping the input into electronic rivers. These, if properly directed, can multiply the human effort and wash, massage, organize, compare with the past, and separate the input–putting the debris here and a small pile of shining needles there.

How much of this can the computer, in fact, do? Part I attempts to define T/A, and Part II attempts to answer the computer question.

PART I. TRAFFIC ANALYSIS

1. Glittering Generalities

The purpose of SIGINT is to make available to supported commanders a reconstruction of the target Order of Battle (O/B) and changes thereto as derived from target emissions – and in time to permit educated command decisions to be made.

Order of Battle answers the command question about the opponent, "What forces oppose me? What are their titles, types, echelons, command relationships, equipment, morale, strength, locations, deployments?" It is a static description of the target at a moment in time.

Changes in O/B update the answer by establishing a vector; he was here then, now he's there; his O/B change is describable and sometimes measurable in amount and direction. Such intelligence vectors assist the commander to understand target changes in capabilities and to estimate hostile intentions.

2. Serendipity

SIGINT attempts to accomplish its purpose in several ways. One school of SIGINT thought has it that in combat all is flux; that little can be equated from day to day; and that the valuable SIGINT answers will be derived from exploitation of readable traffic (cryptanalysis) and the unusual, the compromise, the momentarily understandable in an ever-changing environment (traffic analysis).

This approach is Serendipity – the happy faculty for finding valuable things unexpectedly. Cryptanalysis has put a massive effort into reading as much encrypted text as possible, using substantial computer support to break into and exploit traffic. (The best way to find the most four-leaf clovers is to examine the entire lawn.)

Traffic analysis is governed by fewer rules and varies more in its application. Serendipity is also systematized by using a small number of full-time omnivorous readers who see all intercepted traffic, all reports on it, and all friendly correspondence relating to the situation. Ideally, their memories are photographic and their knowledge of O/B encyclopedic. They ignore all that does not excite their curiosity but seize anything with known indicators or with interesting unknown features. They then assemble all other traffic from that net and from any other net with the same SOI or displaying the same indicators or features. From this section of input is deduced the activity, often only after extensive study. But the reading of new material must continue, so that higher priority compromises, or additional data on the one being exploited, won't be missed. And collection must be redirected in order to pick up more of the activity.

SIGINT tries to take "unexpectedly" out of the Serendipity definition by collecting as much as possible and by examining it all for exploitability. From the serendipitous approach comes most of the SIGINT headlines – the front page stories.

And there is no question of its value. But it is unpredictable. It produces immense detail on a minor unit one day and on the entire O/B the next, but by its nature it cannot sustain its effort on any one subject. There is always a new fire to put out. Often, by itself it cannot answer the commander who asks, "Do all of the forces that opposed me yesterday still oppose me? How have they changed? Are there new ones?"

3. Continuity

As opposed to Serendipity (Crypt or T/A), which monitors the entire stream of intercept but selects only a small porter for exploitation, Continuity, i. e., traffic analysis, must process it all. It must sustain the effort, carry knowledge gained from compromise forward into overtly different communications structures, keep continuity, keep track of all of the units opposing us yesterday, and identify new ones. This is cleaning the stables.

Intercepted communications come in "sets," messages and chatter exchanged between two or more callsigns representing command or staff functions of one or more military units. The most repetitive terms in each set are the calls used, and the most useful term (because it is not arbitrary) is the frequency applied by the intercept operator. These are

the built-in terms labeling a set. They often are enough to identify the set, but the terms occurring in messages and chatter must usually be used as well.

Since calls and frequencies (and other terms) change frequently, the same *net* may be presented by many *sets* over a period of time. And each major unit controls many nets, an army group or military district often having as many as one hundred nets potentially active at the same time (plus the nets of its subordinates). These represent the different command and staff functions of the unit, working with different combinations of organic and subordinate command and staff functions, and with many alternate nets (morse, voice, and printer parallels).

Fortunately, the collection of terms and the typical formats into which they fit (like sentence structure) are usually sufficiently revealing to permit the intercept operator and traffic identification analyst to label them with some accuracy–at least as to country and service.

So traffic analysis – the proper labeling of each set of intercept, of each radio station, and of each activity – begins at the intercept set. Based on the initial set label (case notation), the intercept is sorted, and more or less homogeneous piles are given to each analyst for further processing.

Continuity is the "Alias" problem; set 542 is the same as set 821, which was the same as set 127, etc. Done exhaustively, it reveals only the number of nets active. It does not reveal who the stations are, where they are, what functions they represent, or where the net fits into the network. It does permit the application of the answers in one set to all of the other sets of which the set is a continuity.

Serendipity, either as a separate function or that of the continuity analyst in the course of his processing, provides the who, where, what, and structural location of the net. Continuity carries it forward.

4. Battlefield Vocabularies

Most of the categories of military communications terms are encoded for electrical transmission. A list of arbitrary terms is *generated* (calls, addresses, codewords, etc.) according to some sort of system. From the semifixed list are *selected* subsets of terms for each period according to other, local systems. And the selected subsets are *allocated* to various users according to still other systems. Frequencies follow the same scheme, except that they are not arbitrarily generated; they are selected and allocated according to locally devised systems.

For each period, then, the selected subset is matched against a list of plaintext meanings. The plaintext list (units in O/B order, command and reporting phases, etc.) does not change very much over a long period of time. The encoded terms for transmission change frequently and usually provide for a number of alternate terms each period. Change in the plaintext list of units usually indicates change in O/B.

There are two stages in the traffic analytic attack on the problem of battlefield vocabularies. The first is the isolation of terms in a category which presumably come from one subset: calls used by one or more related nets that possibly come from one callsign book; addresses used in an area presumably selected according to a common set of rules from a master list; frequencies used by related nets and presumably allocated from the same subset; etc. The collections of terms so isolated are input in the second stage, that of solving the systems of *generation* of the master list, of *selection* from the master list for the period being examined, and the *allocation* of the selected subset to the corresponding plaintext list of terms.

Generally, there is little point in trying the second stage (solution) until the first stage is accomplished with some accuracy. And the first stage depends upon the success of the continuity effort, since a single set of data will not, normally, provide enough terms to permit successful attack.

Success in any part of the attack makes the whole much easier, (e.g., solution of the callsign book generation system permits set and nets to be associated rapidly, which then provides collections of data for attack on the frequency problem).

5. Activity

Continuity and the solution of battlefield vocabularies, as discussed above, provide the skeleton of Order of Battle. Changes in O/B from one time to the next provide inferential information about target intentions: e.g., this division has been resubordinated from Army A to Army B; the capability of Army B is thereby measured and inferences may be drawn about its intentions, etc.

Better information is often available. The cryptanalytic solution of enciphered text and the traffic analytic solution of plain text and brevity codes often give more direct and valid information about capabilities and intentions. Grids give relative unit positions and artillery (tube, missile, and bomber) targets. Codewords give implementation times for activities and may, if solved, define the activity. ELINT cuts may reveal concentrations of radars in defense of troop concentrations or locate beacons for airborne drops.

The Serendipity approach acts, almost entirely, on the isolation of such revealing texts and then finds all related nets to build that part of the network for the period. And it may well be that this is all that is possible in a fluid battle area of some size.

Continuity attempts to account for all units, both active and inactive. If it can be accomplished, this complements serendipity by providing information on the existence of reserves and uncommitted and inactive units, and by providing the skeletal O/B to which interesting activity can be related.

PART II. THE COMPUTER

1. The Computer is an Idiot

So, too, is a shovel, a lever, and a quill pen. The difference lies in the time lag between human control and mechanical or electronic action. A shovel, lever, or quill pen is used directly and immediately by a human being; a computer is programmed for use in the future.

Directing action at second hand and in the future is very difficult, particularly if it is impossible to predict what may be sensed at the time the action is required.

You drive your car at some speed towards an intersection. Without conscious thought you identify all fixed scenery and all moving objects. You compute their probable positions at the point of time at which you will be in the intersection and, semiautomatically, you hit the brake, accelerate, or continue at your previous speed. But just try to get the car safely through the intersection by briefing a non-driver (the programmer), who will in turn instruct (program) a rote passenger on what to sense and what, in each possible circumstance, to instruct the blind driver to do.

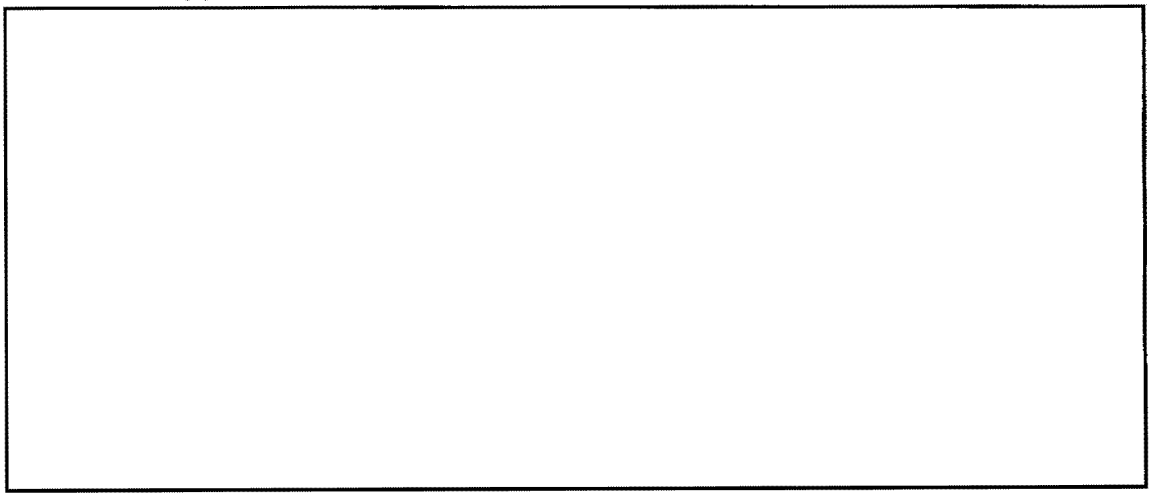
The difficulty lies in trying to explain what you have done, step by little step, when you have written a sentence with your quill pen or driven your car.

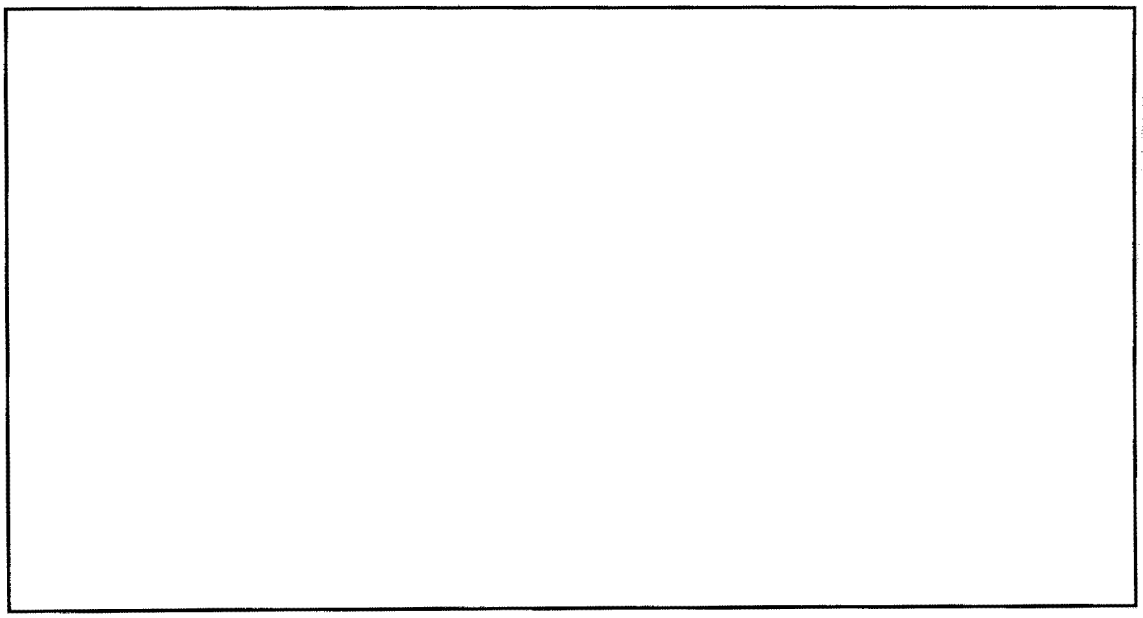
If it can be done, it multiplies your power very considerably. The computer, properly instructed, can drive a hundred cars as well as one. For this reason, it is a challenge and well worth trying.

2. What is the Computer Now Doing For T/A?

Programs now in being, or shortly to be implemented, accomplish a great deal of the clerical work previously done by traffic analytic personnel. In most cases the computer attempts no identification of call, or set, or net with specific military units or nets, but groups like things together and applies the best label added to the intercept by humans. The following process illustrates the type of computer-analyst interplay now in being.

P.L. 86-36
EO 1.4.(c)

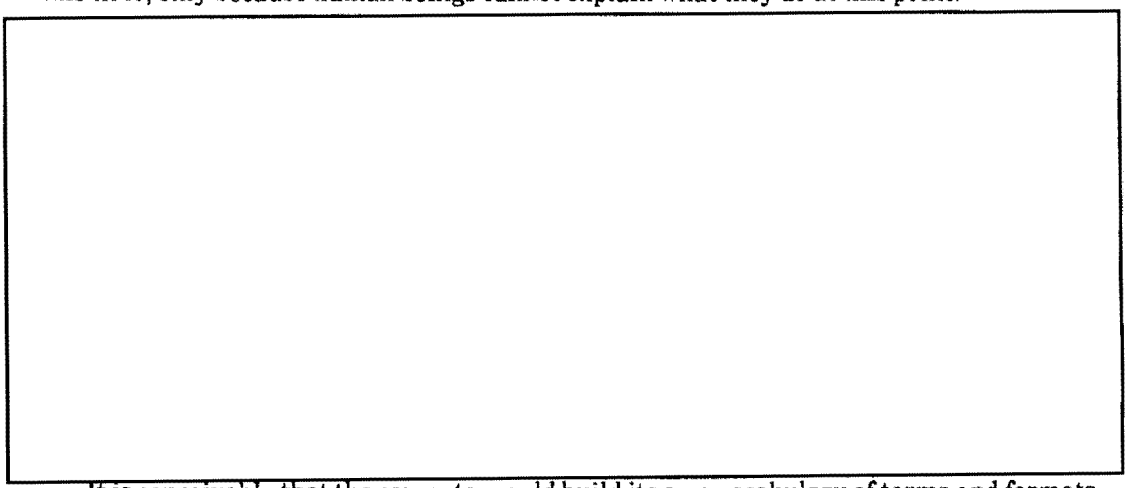




The characteristic of the above type of process is the control of the system by the analyst; if it is used as one of his tools and all of the tables and files in the system are maintained currently, it will work well for him; if the tables are not maintained, it will cause the input to degenerate. The analyst is necessary to the system.

3. What Could the Computer Do?

The manual T/A payoff is in the identification of O/B and of activity. Much of this is concealed by the periodically changing battlefield vocabulary, which humans deal with as "The Game": "sounds like"; "in this context may be"; "the activity around it suggests it may be a synonym for"; etc. It is not believed that this is within the computer capability at this time, only because human beings cannot explain what they do at this point.



It is conceivable that the computer could build its own vocabulary of terms and formats from its input, applying to each the best identification of the set from which it came. A

new set could then have its terms and formats compared to the computer vocabulary and all identifications of previous sets retrieved. The retrieved identifications might then be examined statistically. The computer output might be

This set is (65%) division X

It is (20%) artillery, (5%) SSm

Callsign ABCD is (25%) the umpteenth motorized rifle regiment

Best guess as to case is.....(42%), or.....(29%)

This set is a continuity of sets.....(82%),.....(74%),.....(68%)

4. The Computer in Combat

Those functions now accomplished or suggested for batch processing could be done in much smaller batches, approaching on-line processing. The computer could materially assist in sorting, selecting, and identifying intercept sets and activity and could, as well, guide intercept, if the callsign history could be directly queried. (The previous identification and analytic comment – "want" or "don't want" – could be made immediately available).

Portability is feasible with solid-state computer components, and size is approaching the manageable. The problem lies in analytic use. Unless analysts are trained in and appreciate the multiplication of their power possible through intelligent use of the computer, it should not be used. The machine will only hamper the successful manual operation.

5. Present Problems

The feeling still persists that the computer is an expensive, mystic black box and that it must operate efficiently at all costs. Its priesthood still carries this belief to the point where its efficiency is emphasized at the expense of the T/A problems it serves. It is not comparable to a quill pen, kept sharpened and ready for instant use when needed, as well as being adaptable to the needs of the moment. It is more like a railroad, with trains leaving on schedule (more or less). If you happen to want to go to that point at that time, climb aboard (after having applied for a ticket well in advance). But to change the composition of the train or its destination or its scheduled times is almost beyond the passenger's capability.

Not because of characteristics inherent in the computer, but rather because of the management of this tool, the computer is not adaptable, not flexible, not responsive to T/A needs – except in the case of those needs that are continuing and that can be conceived whole and perfect when the process was first requested.

6. Conclusion

The computer can perform many of the functions that traffic analysts do manually. It can group data into homogeneous piles. It can apply previous annotations to sets of data and to terms. It can sort and list. It can select data or discard them, based on previously determined criteria. It can provide a sizable memory with total recall. It can continue a process whose rules have been defined

PPLL.886386
EBO1144(¢¢)

The computer cannot, at the moment, solve the unusual. A new system or a nonstereotyped sentence cannot be given meaning by the computer until an analyst instructs the computer. (It can, however, collect the unusual for the analyst.)

The computer cannot, at the moment, be used to solve the little T/A problems, such as solving a frequency rota or running out a callsign pattern or solving a key sequence. Most of these problems are hand generated by target signal personnel and change frequently. By the time the analyst explains to the computer what to do, he can solve the problem himself.

The computer, then, is a tool, a big tool. It can materially assist the traffic analyst in his work and do most of the clerical labor associated with T/A. The system does not now permit it to be used as a little tool or a fine tool. And it is no more than a tool.

Build a road with a stream shovel; don't use the shovel to open a door! And yet I think that maybe, if I could tinker with it a bit and try a few things, I could open that door with the computer. Certainly, a better road could be built.

Traffic Analysis on [redacted] Data Transmission Systems

P.L. 86-36

[redacted]

Conventional traffic analysis has never been a glamorous job. It conjures up a picture of untidy desks piled high with traffic of various hues and drawers bursting with much-thumbed tools of the trade – callsign tables, network diagrams and, of course, that inevitable odd file of mysterious unidentified bits and pieces that is never thrown away because it is such a convenient place to put more unidentified bits and pieces. Amidst this scene we find that most maligned representative of the COMINT community, the traffic analyst, continuing his never-ending battle against the nonstop flow of paper and wiping his carbon-stained fingers all over his clean white shirt in a gesture of despair. His plight is known to all of us, and many have done sterling work to try to emancipate him. But despite some machine aid, the lot of the traffic analyst working on conventional communications, morse, radioprinter, and voice has not changed very much in twenty years.

P.L. 86-36
EO 1.4.(c)

The advent of [redacted] data transmissions threatened an even greater amount of paper unless new techniques were developed. As a result of these new techniques, there appeared on the scene a new breed of clean-shirted traffic analyst whose previously cluttered desk is now rarely used except perhaps for lunch.

What are these data transmission systems that so successfully changed the face of traffic analysis? They are very much in vogue these days, and the air and air defense forces of many nations, including the United States and USSR have turned to such systems to augment and sometimes replace their existing facilities for air surveillance reporting and weapons control. Basically, a data transmission system permits the automatic transmission of formatted information by means of digital coded impulses and gives a greatly increased traffic capacity coupled with speed and accuracy.

Two such systems are in current operational use by the [redacted]

To analyze and exploit the information transmitted in a data system, it is necessary to process and present it in a form suitable for analysts. [redacted]

P.L. 86-36
EO 1.4.(c)

[redacted] And so the idea of traffic analysis from a display was born in 1961. [redacted]

It is probably necessary at this juncture to placate the skeptics amongst the old hands who will have none of this nonsense and allay the fears of the new entrant who feels he was not born with enough hands. What is this traffic analysis that can be done at a display and how is it carried out?

[redacted]

[redacted]

P.L. 86-36
EO 3.3(h)(3)

It may seem that the new concept of traffic analysis demands a super breed of analyst – a combination of radar operator, machine specialist and data traffic analyst. It is true that more is demanded of the analyst, but experience has shown that the novelty of the new approach and the results obtained from it have whetted the appetite of those morse traffic analysts who have been transferred to data analysis, with the result that they have adapted themselves to the new techniques with a minimum of training. Air and air defense analysts are, of course, weaned on the interpretation of tracking, and machine handling has been made very simple as almost every requirement of the analyst has been covered in programming while operating consists of little more than pressing the required pushbuttons on the control panel.

Although the technique of traffic analysis from displays is still in its infancy, its

[redacted]

Although it was an air/air defense data system and the threat of unmanageable amounts of paper that resulted in this new method of traffic analysis using an immediate combination of man and machine and replacing the paper by displaying the data, it should not be construed that analysis by display will be limited to the air/air defense world or even to data systems. Traffic analysis involves looking at paper, a lot of paper. It involves sorting this paper and inevitably re-sorting. Obviously such procedures call for machine aid, and in many areas this help is available or planned on a larger scale. But in almost every case this help will be in the form of machine listings, perhaps alleviating the sorting problem, but replacing one lot of paper with another. Perhaps the reader can see a use for displays instead of listings for his own problem. Perhaps a "quick look" would permit enough discrimination to reduce the volume of listings to a minimum. It is hoped that this introduction to traffic analysis or [redacted] data transmission systems, traffic analysis from displays, will open up a new world to the many who did not know of its existence and that it will stimulate further ideas on how to handle traffic.

Traffic Analysts of the Future

P.L. 86-36

[redacted]

Let us take a glimpse into the future – a future much different from today. I want to convey a man-machine concept that visualizes a fairly complete computer complex from intercept collection to the storage and retrieval of intelligence by the consumers from their desks. This sort of data processing assembly line would contain numerous computers with process computers controlling other computers but with humans at certain vital points along the way. Traffic analysis is one of the subsystems in this assembly line. I want to fire the imagination of the traffic analysts, managers, data systems analysts, R & D types, and others so that some day we can put the pieces of the assembly line together. Certain operations in the assembly line can best be done by humans until we advance the state of the art in artificial intelligence. In the meantime, we want to make it as easy as possible for the humans.

In this assembly line concept, the output of one stage must be compatible with the input to the next stage or process without extensive conversion, reformatting, or other changes.

The concept visualizes that as the data flow through the system on a real-time basis, a human can call data from mass storage, state the processes (programs) to which they should be subjected, and display the results at any stage desired. Based on the results, the analyst would then specify additional processes until he is satisfied with the results.

Let us visualize how a traffic analyst of the future may work. First, he will work from a console instead of a desk. The console would probably contain at least two CRTs or TV-type displays plus an electric typewriter and light pen. All of these would be connected to a remote computer for the proper man-machine relationship.

Now suppose our traffic analyst wants to get continuity on a very important net for day X. All data are in a mass storage device to which the computer has access. He states his problem on the keyboard in stereotyped English, e.g., "Get all unidentified data from file X for day Y." (This can be further defined as data from certain intercept stations.) "Build and compare net structure with XXMT50101 using Program _____." "Display net structure of XXMT50101 on scope 1 and best match other nets on scope 2." After visual observation of all possibilities, the analyst wants more information on new net number 2. He asks for a display of the crypt systems used by both nets if messages were passed.

Then he asks for a comparison of traffic volume, address groups, etc. Having satisfied himself that the net is correctly identified, he types on the keyboard, "Identify new net structure number 2 as XXMT50101." This activates a program that updates all records in the master file with the new information.

After going through all his assigned nets and maintaining continuity, he calls for the display of all remaining unidentified nets. One group of control and three outstations has now appeared for several days. The analyst calls for a display of the group on a geographic mask with all stations geographically located by the previous day's direction finding. Then he reviews callsign, frequency, cryptosystems, usage and other elements to determine the echelon of the group. With two or three possibilities, he requests an order-of-battle (OB) display showing units located on a geographic overlay. In this way he can compare net structure with order-of-battle of units known to be in the same geographic area. After several tries, he finds a unit which fits so far as echelon structure, but one of the outstation location does not fit. Considering the possibility that the OB may not be up to date, the analyst requests a display of the OB overlay for the last two months on the second display scope showing day-by-day overlays at a two-second interval. With this technique he notes that one unit has been moving. By projecting the movement up to the latest information, he concludes that the unidentified outstation and the one unit are the same. In addition, he now has later information as to the location of the unit. He adds this information to the OB database so that tomorrow when the intelligence consumers interrogate the OB files for new information, this new location of a military unit will be produced.

Identifications are then made on the keyboard, and all records in the file are brought up to date.

Barometer-Readers' Comments P.L. 86-36

The future envisaged by [redacted] bothers me, in that it presumes a traffic analyst (and a consumer) who controls the situation, who asks the right questions of the computer. He queries the computer for new data on his assigned nets (or units) and then asks for all other unidentified nets, from which he selects and develops a new net. This suggests that, if he is preoccupied with other tasks, he needn't ask and *nothing* will arrive on his desk (or CRT). TA need not be done?

If this is not true–and, in fact, he must ask–then why the query at all? A set of mandatory queries ("Give me all, massaged") need be programmed only once and the computer will provide the data routinely. This is, I believe, the TA function. The target, not the analyst, controls the problem. The analyst (collectively) is *required to examine all of the intercept* and do something with it. If a mountain of material comes in, he must cope with a mountain, not just pick out bits he predetermines as being his.

It's like a police department. Does it sit in its police station asking questions about the status of Hollywood and Vine? Or does it patrol the whole city? Who can judge in advance where a crime will occur?

You cannot ask *all* of the right questions unless (1) there are a very limited number of possible questions and (2) you know all the possible questions.

Sincerely, Fred Mason

Sir:

In reference to Mr. Mason's letter in *COMMAND*, dtd March 1969, I don't believe Mr. Mason has heard about management by exception. The advantage of computers is that they can be programmed to look at the unusual. We do have a mountain of intercept, but it is not necessary for a human to look at it all. The computer looks at it all and finds the unusual or unidentified to which the human can devote all his intellect. Let's use machine for the routine and free humans to be analysts. Most analysts like to piddle around with the intercept because they can see tangible progress – that is, process so many papers. Most junior traffic analysts would not know what to do if they were faced with real analysis.

[redacted] PFLL 886386

Mr. Mason's rebuttal:

Management by exception? Maybe. Analysis by exception? I don't believe in it. Along with our primary mission of reporting all changes in O/B is our continuing obligation to reaffirm the status of all known target forces – to always expand, amplify, flesh out the static O/B skeleton. As a premise, we have never fully described O/B; there is always more we could say about a target. If this is true, neither we, nor our consumers, nor the computers, know enough about our target to say "All is normal, don't report." The fact of "normal" activity is reportable.

It has to do with indications of imminence. No one asks that we report everything, but no one permits us to suppress anything either. It is a very thin line we walk, this Pearl Harbor complex. For instance, it is "normal" for any one of fifty people to be in my little cubicle. At what point is it abnormal? When ten are here at once? Twenty? Fifty? It is now "normal" for Soviet crews to man missile sites in Egypt. If there are now X such crews, 2X is a 100 percent increase, surely reportable. But 3X is a 50 percent increase over 2X probably reportable. 4X is only a 331/3 percent increase over 3X; 5X a 25 percent increase; 6X = 20 percent; 7X = 162/3 percent; 8X = 14.3 percent. Is there a threshold below which we stop reporting? Or keeping a count? Or let the computer withhold intercept from us?

I'll go a step or two down the road. The computer is fully qualified (with a lot of analytic guidance) to summarize, to reduce the daily mountain to a comprehendible molehill. But the molehill must be regularly and exhaustively examined, refined, compared with previous molehills – and by humans. The validity of this map must be confirmed and reconfirmed by comparison with the mountain it represents (and the mountain itself is only a small sampling of the voluntary overt utterings of secretive "bad guys.")

Fred Mason

PRL 886386
EO 1.4(c)

A Brief Quarter Century of Soviet Crypto/Traffic Analysis

[redacted]

INTRODUCTION

The earliest piece of Soviet communications intercepted by the U.S. was dated early 1944,[1] according to my crypto/traffic analysis (C/TA) records. Since that time we have experienced many varied and complex problems in the TA field. We all know that TA deals with the items of communication that make it possible for the transmission of a message–the analysis of the text of which becomes cryptanalysis. In turn, C/TA is that special area where a cryptanalytic attack is made on the elements of TA in the attempt to assemble order, primarily military order of battle.

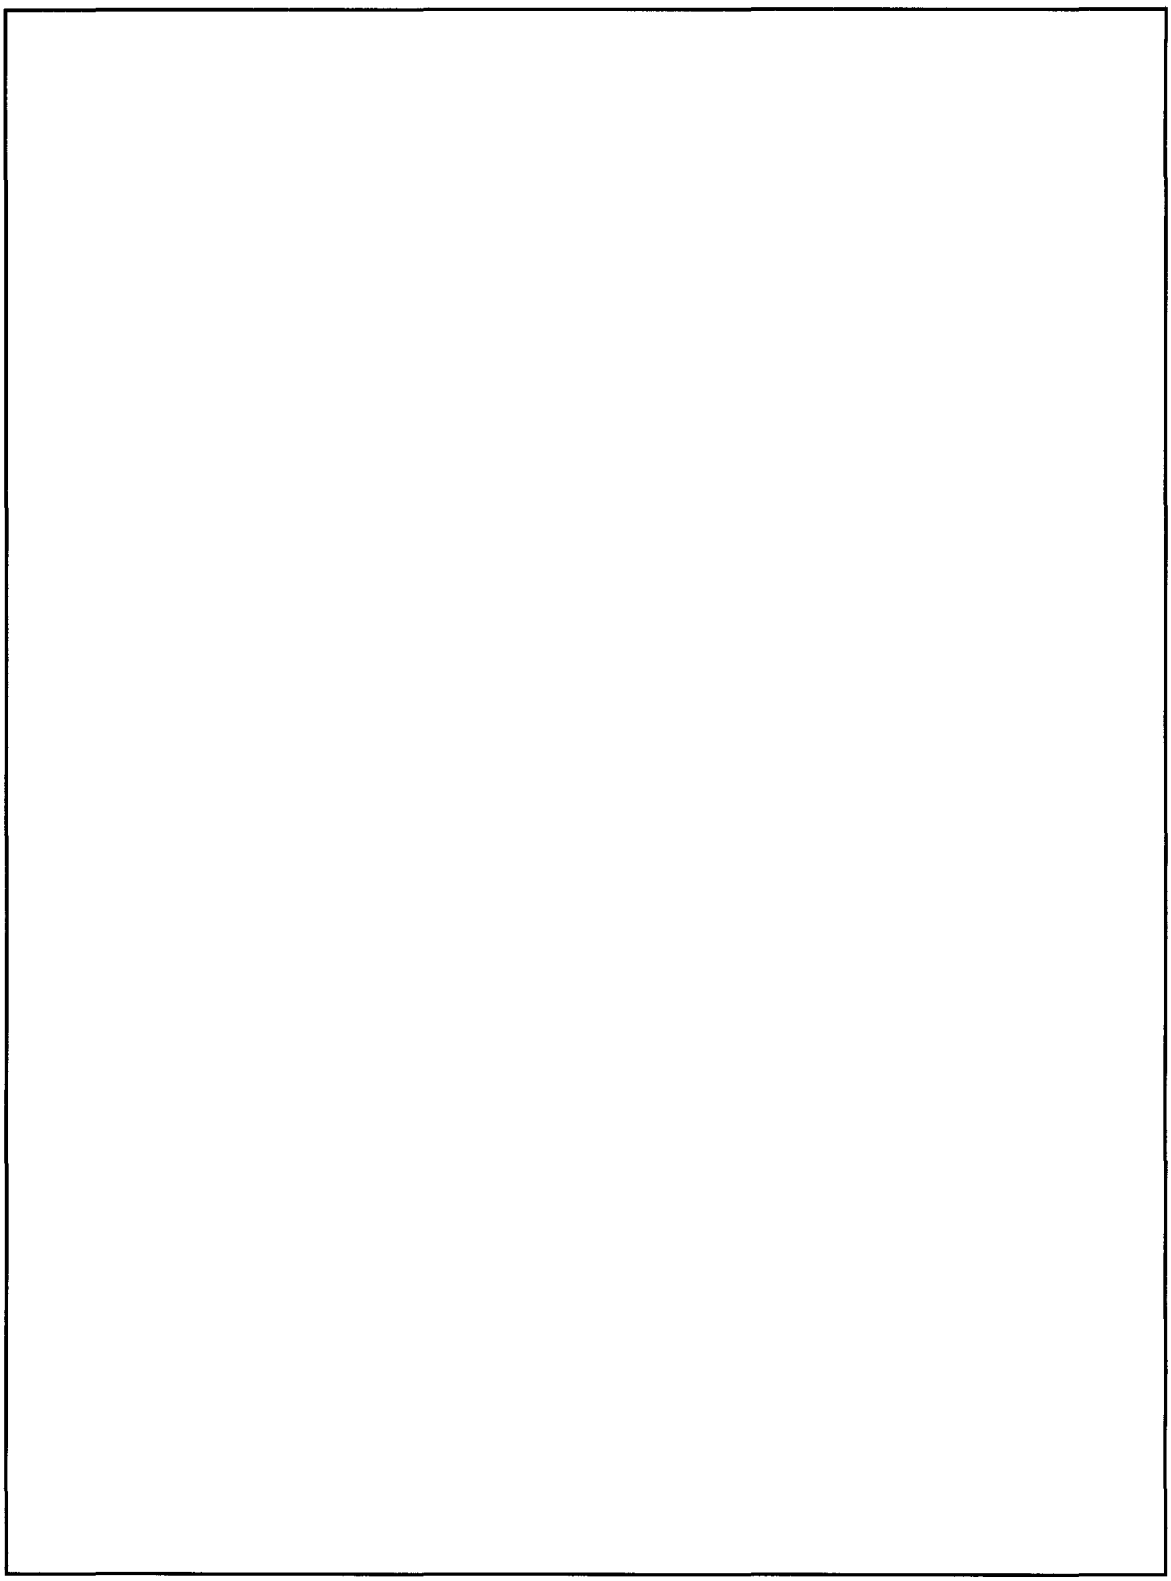
I have chosen as the base for C/TA the twenty-five years NSA has devoted to Soviet communications. The progressive improvements of these systems from an elementary state to certainly the most sophisticated yet indicates the degree and effort the Soviets have taken to deny the SIGINT community C/TA success. Also, we can be reasonably sure of the existence of strong Soviet influence in the communications of other Communist countries.

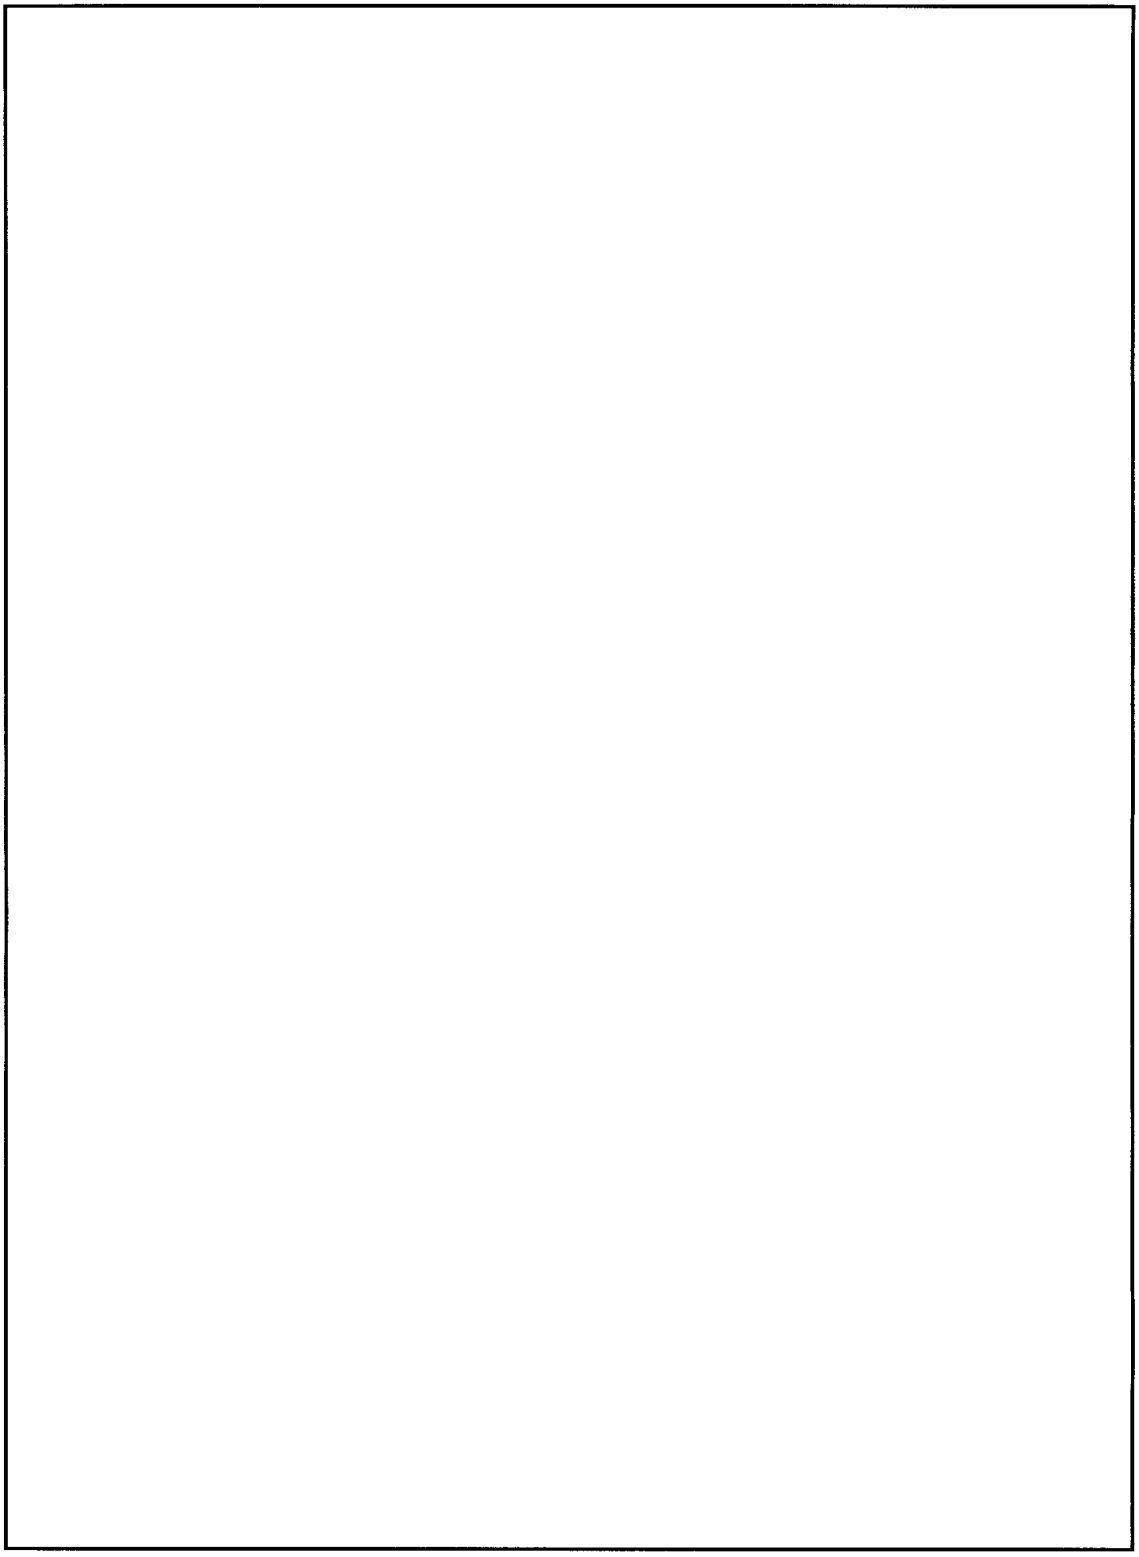
This paper is confined to callsign systems analysis.

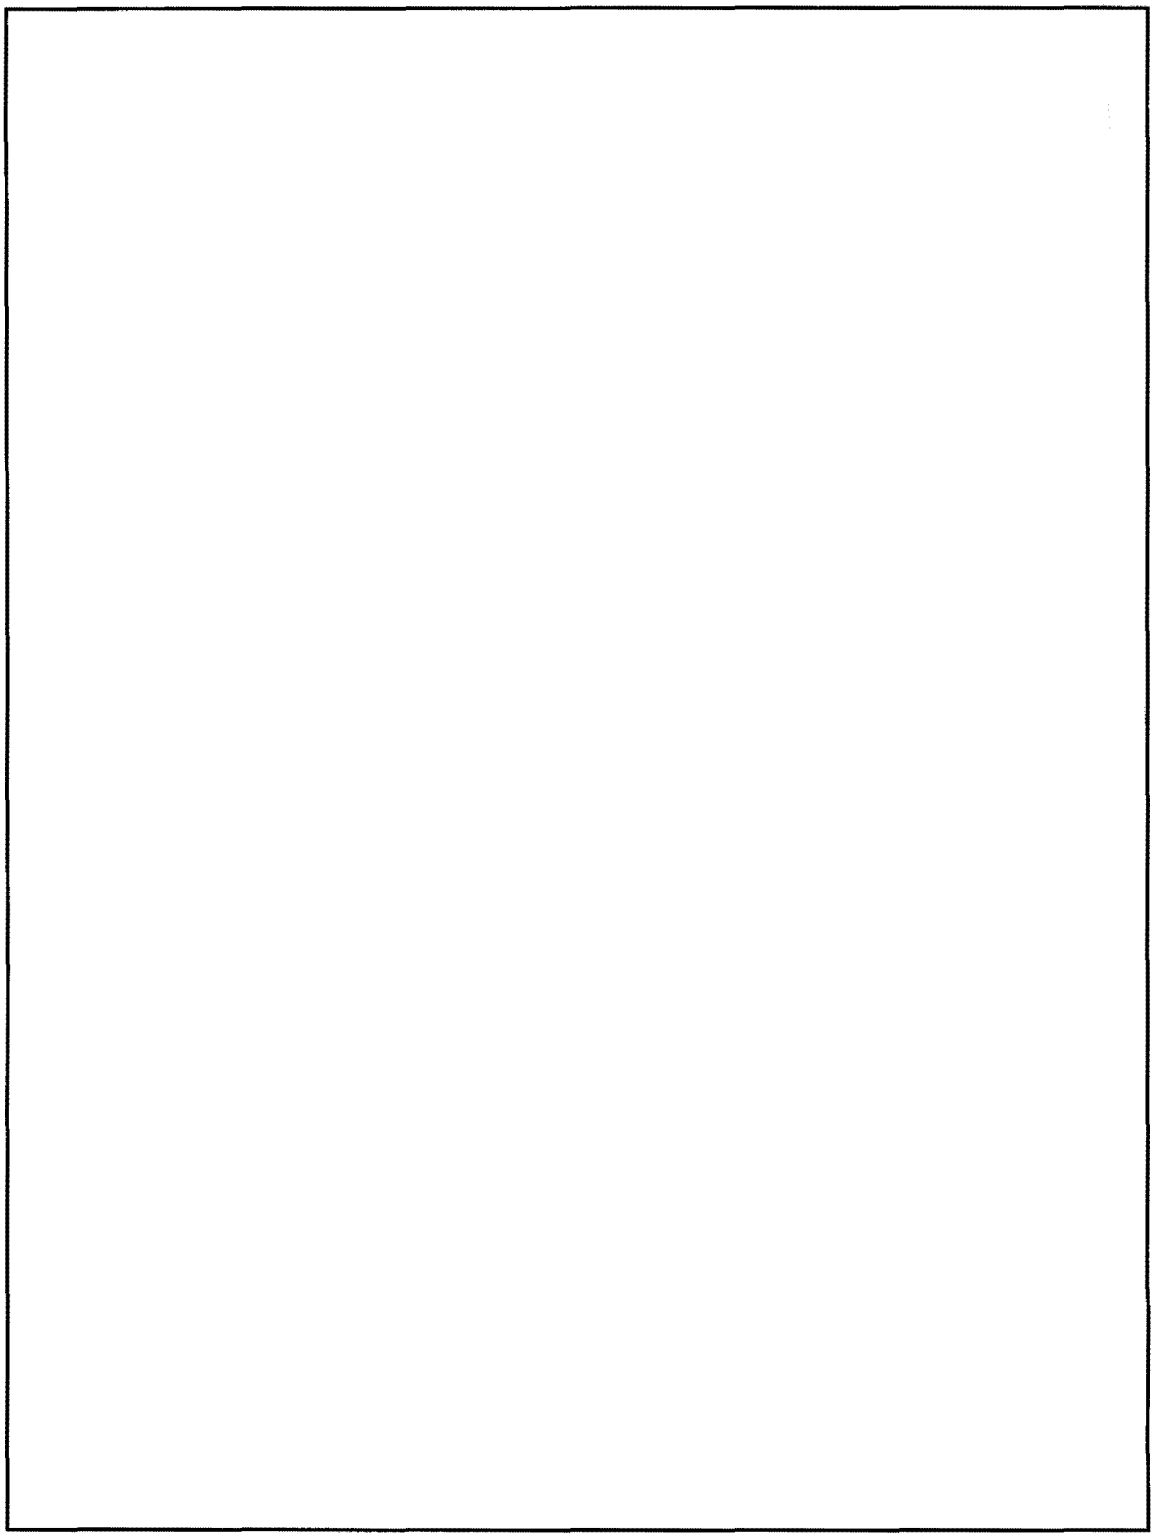
THE PRIMITIVE YEARS

While the United States C/TA effort did not actually begin until about 14 February 1944, we glean an insight into the earlier Soviet posture from captured German documents. We may summarize the period prior to 1 November 1948 as one in which very limited control was exercised over communications of the military forces by the military cipher office in Moscow. [redacted]

1. The U.S. Navy was already working on Russian traffic in Alaska in 1943. Mr. Frank Raven [redacted] and, according to him, the British began passing Russian traffic to the U.S. in 1940 or 1941. The author cannot further document this earlier period and, therefore, would be grateful for assistance from anyone possessing a documentation or recalling the contents thereof to set the record straight.







These have been the highlights, briefly told, yet symbolizing the culmination of many sympathetic efforts on these varied systems–each of which represented a greater challenge than its predecessor. I am proud to have served the C/TA effort during the part quarter century, and I envy the role of C/TA of the future because of the inevitable technical challenges.

Recovery of a Vietnamese Communist Callsign System

[redacted] P.L. 86-36

The recovery of the Vietnamese Communist callsign system now titled AO1 (V61A, Abigail-1) clearly demonstrates the value of historical research toward the full understanding of a presumably obsolete signal plan, in that it facilitated recovery of its successor system. P.L. 86-36 EO 1.4.(c)

True Base: Two Tales (U)

P.L. 86-36

[redacted]

Both of these tales are true. Some of the details have been changed, but not necessarily to protect the innocent. They both have to do with the same thing: what happens to our knowledge about a target when we put one of its systems on true base.

Maybe It's Related to the Phase of the Moon

P.L. 86-36
EO 1.4.(c)

[redacted]

This story of the dissection of a callsign system proves the validity of that old saw "Many a true word is spoken in jest." It proves a lot of other things, too – among them that it ill behooves the cryptanalyst to dismiss the word spoken in jest too quickly. But you may ask what a cryptanalyst is doing "dissecting" a callsign system in the first place – isn't that a job for a traffic analyst? Well, in case some of us haven't yet learned the lesson that you can't really draw a line between the work of the cryptanalyst, the traffic analyst, and the linguist, this story provides a bit more proof of that, too.

The reader has probably guessed by now that the title of this piece was the "true word spoken in jest." But it wasn't really spoken entirely in jest, because we knew that many of the [redacted]

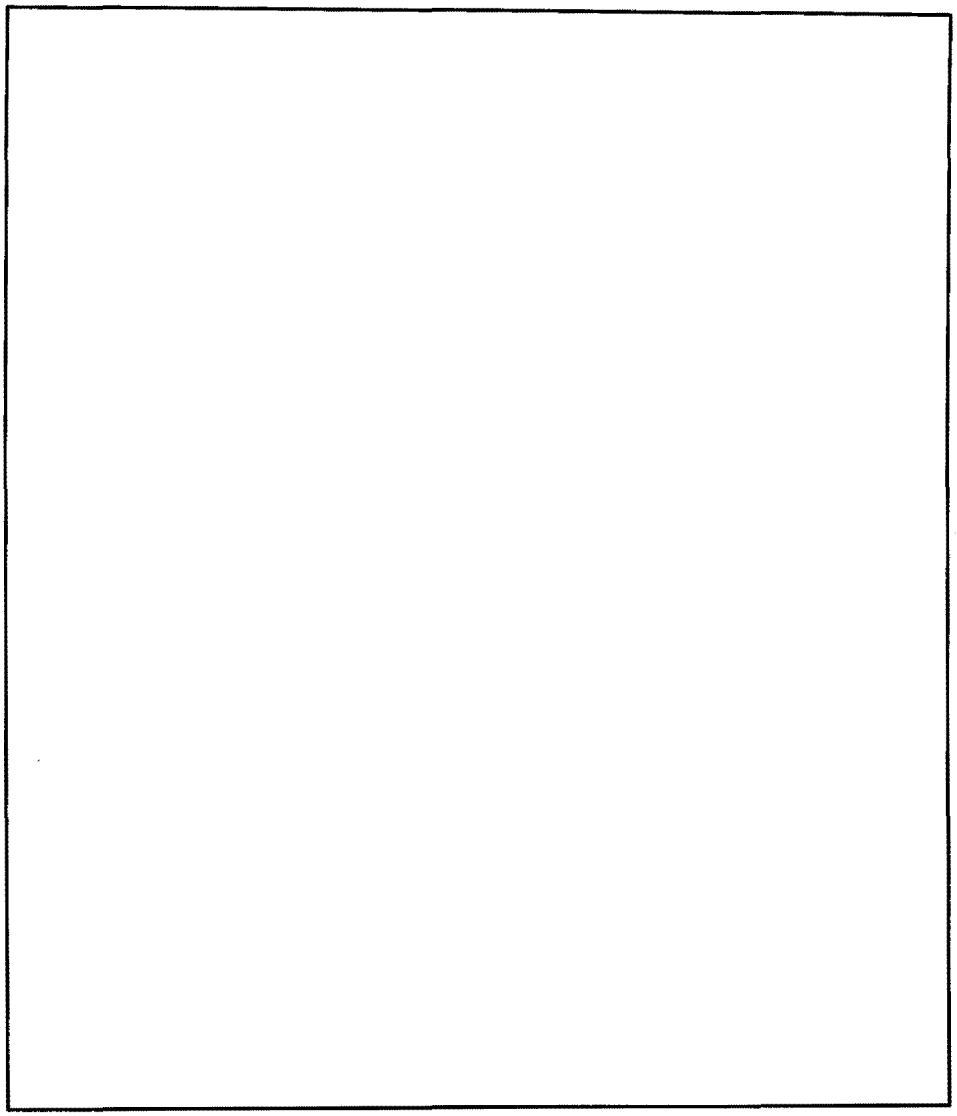
Acknowledgments

In recording the story of type [redacted] foremost recognition belongs to Mr. C. Garofalo (P1), who so capably directed the exploitation effort (as on every other [redacted] system) during the first year. Recognition also belongs to the many other dedicated members of the [redacted] Task Group, including analysts from P1, A61, and the former A2. I took over the task group at the end of the first year, after the initial trauma was past and the system was well on its way to recovery.



Area Studies and Their Place in Traffic Analysis

[redacted] P.L. 86-36

The area study of a target country and its foreign influences provides essential support to the traffic analyst in developing a knowledge of existing communications and in selecting methods for the exploitation of these communications. Area studies include a broad and diversified range of factors influential in communications development.

Initially one should become familiar with the physical terrain of a country. If there an outlet to the sea? If so, what communications serve the area? If not, is the country dependent upon another area to import and export material? Is transportation limited to natural means such as rivers and narrow roads, or are there adequate transportation facilities by which movement within the country can be accomplished? Is the area mountainous, thereby interrupting long-range communication, or is the land basically flat, aiding in long-range contact? What is the climate like? Is it extremely hot or cold? Is the weather a factor in the method used for communications, or does it have little effect?

In Africa an important developmental element is the European colonial power that ruled the area prior to independence. Each power imported its own communications equipment and trained its subjects in its own methods. Whether the colonial power was Britain, France, Belgium, Portugal, or Spain made a considerable difference in the procedures introduced and the level of sophistication achieved. The influence of the colonial power can be seen not only in the communications but in many other aspects of the developing countries. Of significance also is the present-day rapprochement between the independent country and its colonizer, in the type of aid agreements and the dependence of the new country.

The level of the communications is also dependent in part upon the education level of the technicians. Areas of low educational opportunities cannot be expected to employ sophisticated operating procedures. However, it has been noted that each year they become more advanced.

The administrative structure of a country is an especially valuable factor in the understanding and exploitation of the communications structure. If facilities are limited, it is to be expected that they will be placed where they are most needed. Frequently different organizations employ the same set of facilities for communication purposes. A normal pattern in Africa is to have the control station located in the capital city of the country with the outstations in the provincial capitals and any subordinate stations located within the area encompassed by the province. A knowledge of the administrative structure greatly facilitates the reconstruction of these networks. Along the same lines, a basic understanding of the organization of the police and military in each country is particularly useful.

Having acquired a basic understanding of the rudimentary background of a country, it is most helpful to have a knowledge of the attitudes of the people. This enables a traffic analyst to understand why various acts are performed and to anticipate the possible outcomes of any given events. To understand the people of a region, one must closely examine their historical background. What are their social patterns? How have they evolved and what part do these play in the daily life of the people? What are the religious beliefs and how strongly do they influence the people? Is the population, on the whole, stable, or are the people inclined to rise up easily against control? While these factors may not be readily discernible in countries of a high level of sophistication, they play an increasingly important role in the developing counties.

The political make-up of a country also is a gauge in the development of communications. Is the government popularly elected? Do tribal or party affiliations play important roles? Is the government a military dictatorship? How susceptible is the civilian government to a coup d'état by the military or some other factor? What is the party structure? Is the country ruled by a one-party government? Is the government corrupt, and what are the chances for subversive activity? If subversive elements exist in the country, what is their background? Are they communist-inspired, or is their raison d'être one that can be more easily remedied?

Bordering countries should be studied on the basis of not only their colonizer but also their relationship with the country of primary interest. If dissident elements exist, are they receiving support from a neighboring country? Is the country interested in the downfall of the government of its neighbor? Are there mutual defense pacts or customs unions between the areas? Often the relationship of a country with its neighbors is a determining factor for the structure of its communications. Is it necessary for the country to use transportation facilities of its neighbors? This aspect may involve the development of a communications link between the two countries.

The level of the country's economy and stability indicators should be studied. Are the large concerns operated by the nationals of the country or by foreign technicians? Do the companies have their own communications? Are they within the country only, or do they have a link with the colonizer? If foreign nationals operate the industry, is this a cause for unrest? What is the commercial importance of the country's products on the world market? Do fluctuating prices play an important role in the economic stability of the country? Does the country have important mineral resources so that it might be considered a prize in the East-West struggle? Is there no industry and is the economy dependent upon primary produce for its revenues?

Another area of importance in considering methods of exploitation is the language employed. In the African countries, one of the most secure mechanisms is the use of indigenous languages and dialects for sending messages. This is of importance to the traffic analyst in the area of station locations and military unit locations. An unknown language, like an unsolved cipher system, can place a handicap on the traffic analyst.

Only a few of the many aspects of area studies have been discussed in the foregoing pages. However, it should be readily apparent that area studies play a vital role in traffic analysis.

The 1970s

The Reality of Communications Changes

[redacted] P.L. 86-36

All analysts and managers of analytic efforts must constantly face both the possibility of a communications change on their targets and the consequences of such a change. The term "communications change" frequently causes unnecessary apprehension – the change does not inevitably signal adverse consequences on target identification, maintenance of continuity, and production of SIGINT. Many changes (introduction of new callsigns, frequencies, etc.) on most targets are routine; they occur regularly and are only slight hindrances to the proficient analyst. On the other hand, some communications changes are *not* routine and do have an adverse effect on SIGINT production. They can result in reduction, or even total loss, of capability to identify and maintain continuity on target communications nets and the specific associated terminals. The latter type of communications change is the subject of this article.

* * * * * * *

Changes that might affect exploitation capability will vary greatly for different targets, depending on the extent of current exploitation and on the complexity of the newly introduced operational procedures. However, knowledge of the relationship between various communications features can greatly assist in prediction of future operational usage. Some features that should be considered follow:

[redacted] P.L. 86-36 E.O. 1.4.(c)

3. *Sudden versus gradual change*: Many changes (e.g., newly allocated frequencies) can be implemented immediately upon receipt. Other changes require "live" testing and extensive operator training and orientation. The following changes, for example, would probably require an extended period for implementation:

a. *Introduction of a more sophisticated mode of communications*: Equipment procurement is usually limited, and testing and training are required before the new system becomes operational.

b. *Use of a new Morse cut number system*: Operator training is obviously required prior to full implementation.

c. *Introduction of abbreviated language for chatter:* The nationwide replacement of English by abbreviated [redacted] as the vehicle for operator chatter is an example of a change requiring extensive operator training. P.L. 86-36 E.O. 1.4.(c)

Some indicators of an impending communications change are

1. Temporary extension of the normal period of use of existing SOI materials;

2. Limited testing of new procedures on existing links/nets or on supplementary communications;

3. Direct references in chatter to new procedures. Such references could consist of anything from a casual implication to a statement of the effective date and type of new SOI materials;

4. Trends toward standardization or diversification, whichever is applicable;

5. Use of or references to more sophisticated modes of communication.

****

Although the ability to predict impending communications changes is a distinct advantage, recovery of continuity on target communications is greatly expedited by contingency planning that defines actions to be taken following introduction of new SOI materials. Contingency planning in preparation for subsequent analytic recovery must be realistic and flexible. Consideration should be given to the following factors:

1. *Timely field station reporting of deviations from the norm*: As the mission of most collection sites is limited in scope, this reporting permits higher echelon to make an early assessment of the overall extent of the communications change, to advise all elements concerned, and to issue necessary instructions.

2. *Target recognition/identification*: Even though such things as callsign and frequency usage have changed, the best source of target recognition/identification is the operator who has copied the target in the past and who will probably recognize it in the future. Operator identifications should be considered valid unless disproved. These identifications should be provided, in a format usable for traffic identification, to other field sites that are tasked with similar targets and that are likewise encountering difficulty in isolation and identification of mission targets. Thus, time will not be wasted in copying communications that are another site's mission.

3. *Establishing procedures for early continuous follow-up collection on potentially mission-associated communications*: Although these communications may not be

identified beyond nationality, establishing procedures for early collection will prove most advantageous.

4. *Determining possible methods of attack as a means of associating homogeneous intercept and performing follow-on analysis*: In making this determination, we must ask, "What would we do if the old tried and proven analytic techniques and aids were no longer available?" A definitive answer to this question will probably not be found, but alternate approaches can be devised. For example, if callsigns cannot be exploited, related intercept can often be associated on the basis of [redacted] features. These features may, therefore, need examination very early after a communications change. P.L. 86-36 E.O. 1.4.(c)

5. *Once the possible methods of attack have been determined, developing detailed procedures for quick implementation*: These procedures include issuing instructions to be followed in the event of a communications change, outlining processing (preferably in conjunction with a flow chart), and devising the machine software that would be needed for machine processing. Processing of data after an extensive communications change does not require completely new procedures, although some alternation or expansion of existing standard procedures will probably be necessary. Maximum retention of established procedures, which are already well known to all operating elements, will cause minimum confusion following a communications change and will aid in early recovery.

6. *Maintaining continuous documentation on all special processing or analytic actions taken and the type, extent, and data of actual changes in target SOI*: This documentation will aid in keeping all elements currently informed and in preparing for later SOI changes.

****

If this article succeeds in stimulating more realistic planning for future communications changes, deterioration of SIGINT production after such changes will be minimal.

A Note about Organizing T/A Problems

P.L. 86-36

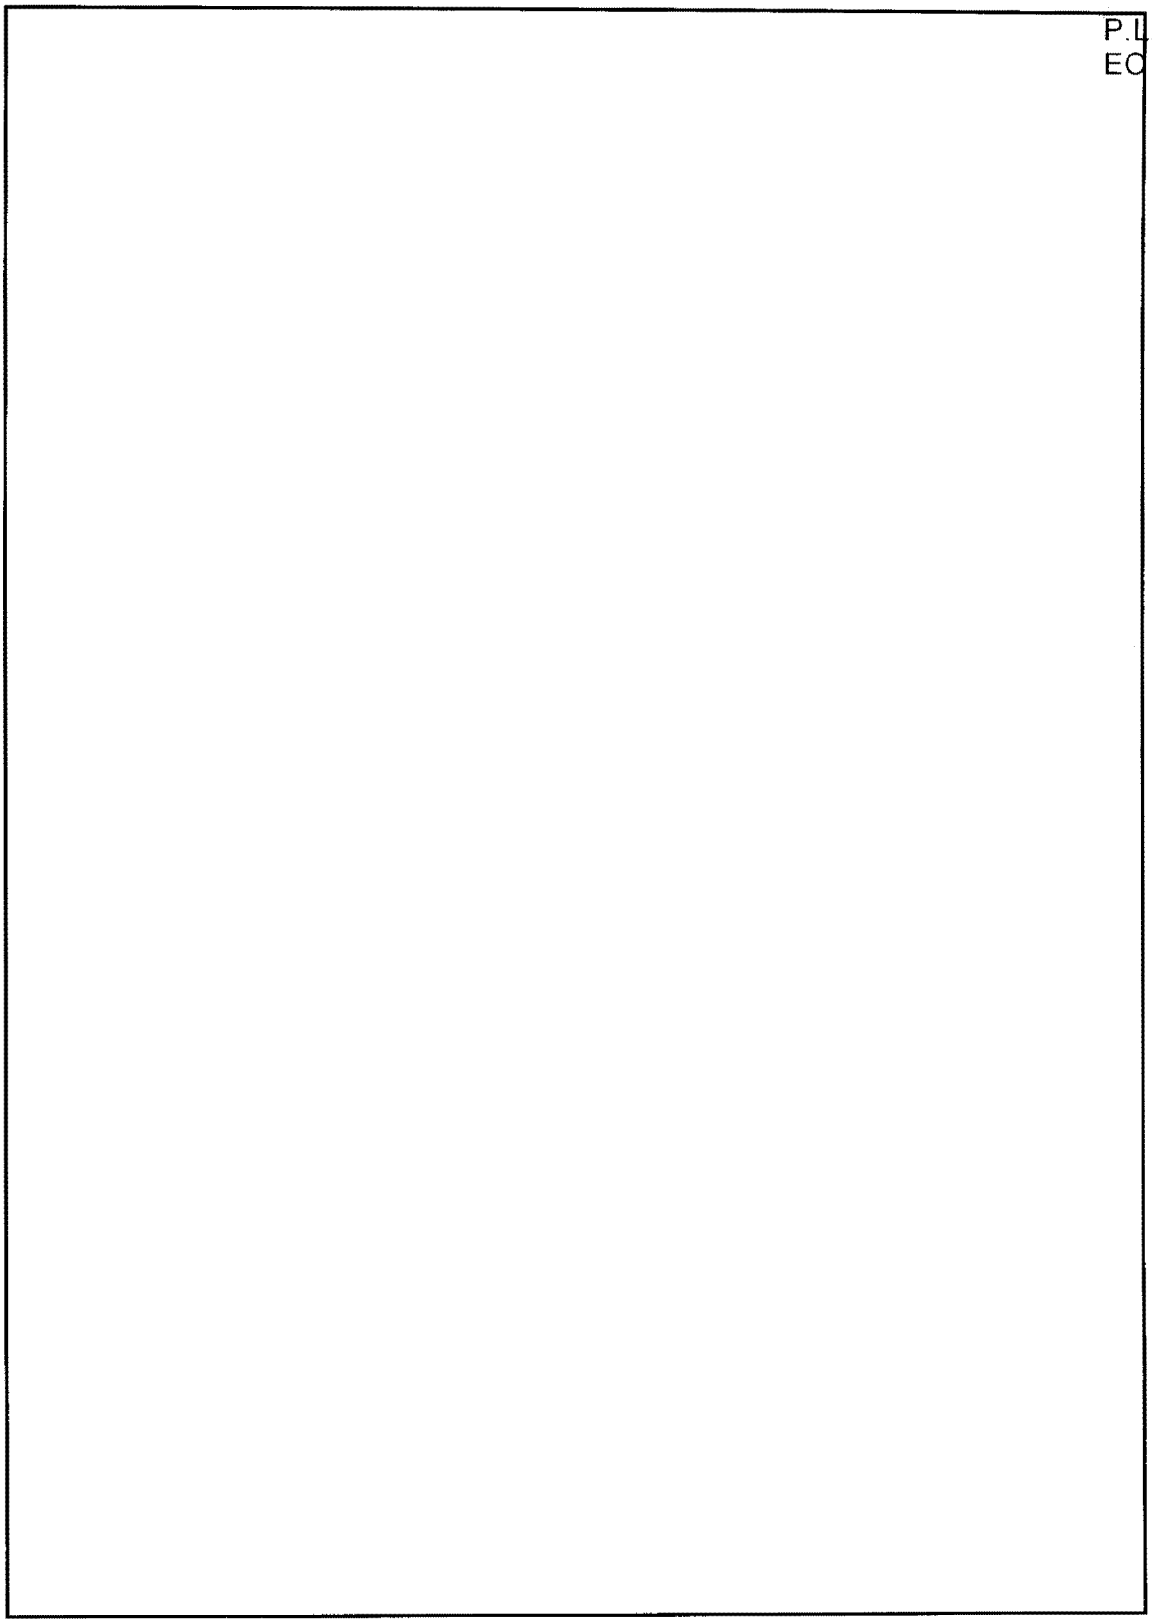
The ancients (Greeks, I think) believed that there was a central and fundamental Truth that underlay all worldly things and that man's goal should be the discovery of that Truth. In my salad days, as I wrestled with questions about how to organize a T/A effort, it seemed to me that there ought to be some basic fundamental T/A System; given that System, it ought to be possible to organize any T/A problem correctly.

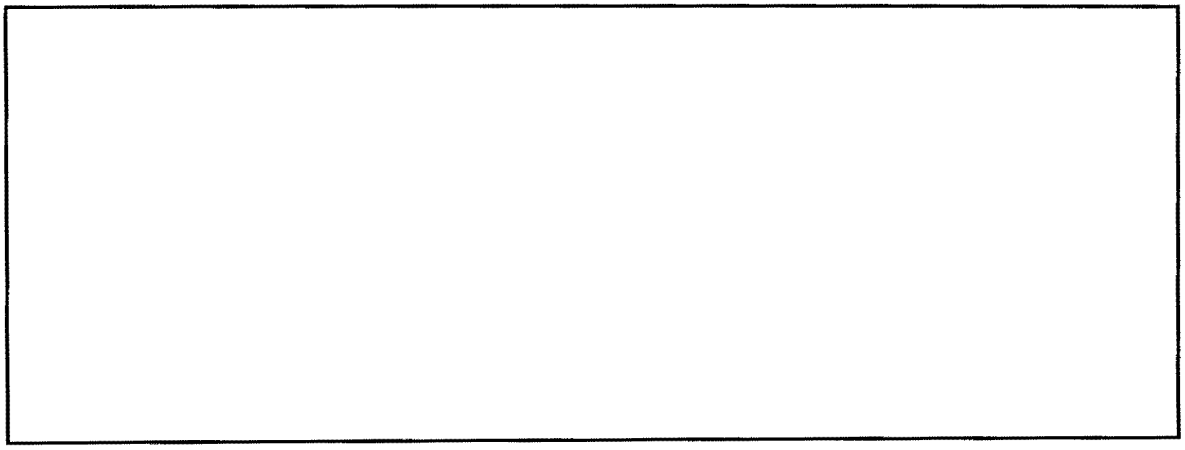
As my arteries have begun to harden, my beliefs about these questions have shifted. It now seems to me that the most effective organizations (T/A and others) have been those that concentrated less upon adherence to some discovered Truth and more on defense against catastrophic failures. Consider all of the possibilities (in order of likelihood, if you wish) that could wipe out the average T/A shop: many-fold increase in traffic, major comm change, loss of key personnel, comms outage, destruction of database, etc. Organizations that can survive are those designed to adapt and adjust – to roll with the punch. Those that can't adjust go quickly into imbalance and overload, and major surgery (reorganization and restaffing) is necessary.

The principal difference between these two viewpoints is in their levels of complexity. The central Truth idea is really a two-body problem: if you can measure where you think you are and where you think the center of Truth is, then you can form some notion about whether you are heading toward your goal or away from it. However, the catastrophe defense idea is more of a multibody problem – strengthening your defense against one possibility often weakens your possible response to others, and some balance is clearly necessary.

Unlimited defense against all possible contingencies is, of course, impossible without unlimited resources. The scariest part of this notion, however, is not that defenses must be limited; it is rather (as any computer programmer will tell you) that none of us is smart enough to think of all the bad things that can possibly happen. Surprises do come along, and it is, I suppose, the continuing possibility of the unexpected that keeps this business interesting.

P.L. 86-36
EO 1.4.(c)





Traffic Analysis Mechanization Forum

OPENING ADDRESS BY MAJOR GENERAL JOHN E. MORRISON, ADP

Good Morning, Ladies and Gentlemen, and representatives of the Service Cryptologic Agencies.

I see a man in the back there, [redacted], who reminds me of a story I tell frequently – but Charlie is rarely around to hear it. I joined the cryptology business in February 1942, when the Signals Intelligence Service was holding up in the Munition Building on Constitution Avenue – Charlie was my crypt instructor, using the orange handbook written by Billy Friedman. Charlie and I are still around, hustling at the old stand. Charlie has stayed in the business consistently through the years. And, lest I travel under false colors, let me say that half of my career has been in communications and half in the signal intelligence business, starting as far back as 1942 in the SIS, which later became the Army Security Agency. P.L. 86-36

I'm glad to welcome the SCA [Service Cryptologic Agency] people here – I see some old friends from the field, old friends from PROD, and I see number of people I do not recognize, who, I assume, are from the PROD organization.

I've looked at your three-day schedule; it's an exciting schedule, but I don't know how you'll ever get through it. But from a topical viewpoint there is a great deal of interest in this particular schedule. It will provide us all a common insight, I think, into the kinds of problems we are confronted with today, and most particularly how do we get a bigger bang out of the traffic analysis discipline?

Now we all know that CA is, I guess, the queen of the disciplines and has been for some time. It carries with it a mystique that permits its acceptability, its respectability, in almost any circle – even in uninformed circles. Also when you get into telemetry analysis, people understand that; and signals analysis, people understand that; but this TA business – what can you get out of TA?

What do you get out of TA? We've made a living out of TA!

We've done an awful lot of magnificent things in an ongoing war – a real war in Southeast Asia! That's what we get out of TA! We've made a living out of it.

We handle a tremendous volume of information in the computer center, and I guess because of the diagnostic problems, and the probability problems, and all those things that go on in connection with cryptanalysis, one might say that the lion's share of the electronic data processing capabilities in the basement of this building is devoted to cryptanalysis. When I'm making a "beg bug" lecture on the subject of what we do in PROD – I usually "whomp up" this comparison – we have general purpose computers and we have special purpose computers, and we use our special-purpose computers 90 percent of the time in

cryptanalysis, and we use our general-purpose computers 60 percent of the time in cryptanalysis.

The point is that we spend a lot of time on CA, and the bulk of the residual, the residue of capability, is devoted to the TA discipline – a discipline that has worked so well for us, yet we've got to get more out of it. We must be more imaginative and we must mechanize. In these days with the kind of peril we live in – with all kinds of synchronous crypto devices now available, people wring their hands and express great concern that pretty soon all external info is going to be denied and won't that be a shame. And we're going to be out of the TA business. And these are the same kind of people who said in 1955 "won't it be a shame when all the manual Morse is going in ten years" – I just don't believe that TA people are going to be put out of business. I think we have yet to realize our maximum capability, and it's the challenge of attempting to realize an enhanced capability that I leave with you today in this forum. I ask you to share with each other a common understanding of the importance of TA as it evolves, as we reflect upon it, as the various speakers who have been selected to talk to you provide you with their appreciation. It's going to be tough to cover your agenda, but there's no doubt in my mind that at the end of the three days there will be an appreciation – a real feel for TA as we look at it today and a challenge that must be perceived. I hope that we are energized in our thinking, and I hope we leave here with a new dedication to do something more by way of mechanizing and getting a bigger bang out of that particular discipline from which we have gotten so much pay dirt in the past and that promises to do even more for us in the future.

I welcome you all again – I'm delighted that you were able to take the time to join each other here. I think you do us all valuable service.

Again to our SCA conferees – glad to have you aboard. George, without further ado I'm going to turn the meeting over to you. Thank you – Good to see you all.

Introduction to Traffic Analysis Mechanization

ROBERT S. BENJAMIN

INTRODUCTION

Our purpose this morning is to set up a logical frame of reference for the many presentations on traffic analysis mechanization that will be following in this three-day symposium. We hope to provide an overview of traffic analysis and of mechanization as it relates to traffic analysis.

Mechanization in traffic analysis goes way back, well before computers. When we first got into the cryptologic business in cryptanalysis and later in traffic analysis, in early 1943, we encountered our first pile of "IBM Runs," as they were called then, at Arlington Hall Station. When we examined them, we found that the large pile of prints consisted of headings and preambles of Japanese Army, Navy, and Air Force traffic, sorted by various parts of the message heading. Most analysts were not using the runs, but a few of us who tried to look up things found them immensely useful in net reconstruction and in analysis of routing systems.

I will be acting as an "observer" this morning, a spokesman for many of my colleagues to whom I am indebted for the ideas I will be setting forth.

THE GOAL IS INTELLIGENCE

Traffic analysis - all SIGINT, for that matter - must begin with intelligence requirements. The SIGINT process is sometimes shown as a cycle, somewhat like Sherman Kent's "Intelligence Cycle," which appeared in one of his books. In the case of SIGINT, it goes: *requirements* – leading to *collection* – to *analysis* – producing *intelligence information* – which becomes *intelligence* – leading to more or slightly different *requirements*, and so on. To put it another way, in traffic analysis, we react and respond to requirements from intelligence consumers and must never lose track of this fact. Despite the intrinsic interest of what we do, the goal is intelligence.

Recently, I was reading S.I. Hayakawa's book *Language in Thought and Action* in which he made a distinction between "maps" and "territories." His general point was that in human discourse and in semantics, humans sometimes become confused between the "real world" (or territories) and the way we represent the real world, using symbols, names, etc. (the "maps"). This has inspired the attached diagram, figure 1, as one way to visualize the traffic analysis process. In TA, we build models of other's communications, study these models, and draw inferences from them. This chart may help us to visualize the general process. In figure 1, the top half of the chart (above the line) represents the real world. The bottom half represents how we see it in SIGINT, which we have called the

"SIGINT Models." The top of our chart is the territory; the bottom half is the map. The left hand half of the chart represents the SIGINT target, and the right is communications. Consider for a moment – the target, whoever he is, whatever he is up to, exists somewhere in the world. He communicates because of *need*; his communications represent a model of his organization. We intercept his communications, reconstruct his nets, and have a model of his communications. Basing our study and observations upon these communications, we build a model of his activities and intentions and report these in SIGINT end product. The *goal* of traffic analysis – of all SIGINT, for that matter – is to produce valid intelligence about the target.

DEFINITIONS

What is traffic analysis? There have been many definitions over the years, and a rather widely used short one now current is this:

> "Traffic analysis is that branch of cryptology which assembles information about communications networks by studying the elements of transmissions which are external to message texts."

One could go on to point out that the traffic analyst also may study some parts of a text itself – for example, discriminants, indicators; plaintext messages, short messages such as Air Defense "proforma" messages, and so on – and that he may make extensive use of non-

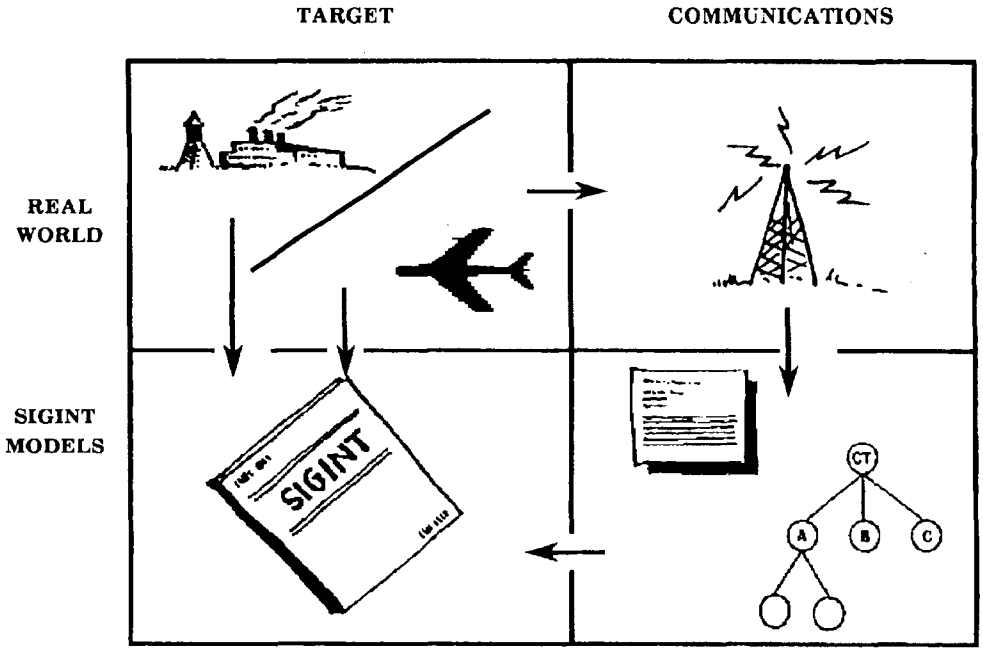


Fig. 1.

SIGINT information (collateral) to draw his conclusions. Traffic analysis has one or a combination of goals: to help SIGINT collection, to assist cryptanalysis, to improve intelligence information, and to assist the COMSEC effort.

DATA AND INFORMATION

In SIGINT, we are in the process of converting *data* ("that which is given") into information ("meaningful data"). These two terms are relative – in the total SIGINT process flow, this transformation takes place dozens and dozens of times between antenna (collection) and the point at which we issue end product.

Let us consider the traffic analytic process. As shown in the accompanying chart (see fig. 2), the analyst takes data and analyzes them. The analytic process consists essentially of making certain *observations* (counting, noting occurrences, measuring, etc.), coupled with making *inferences* based on the observations (extrapolating from the observations, drawing conclusions that are not explicit in the data, etc.).

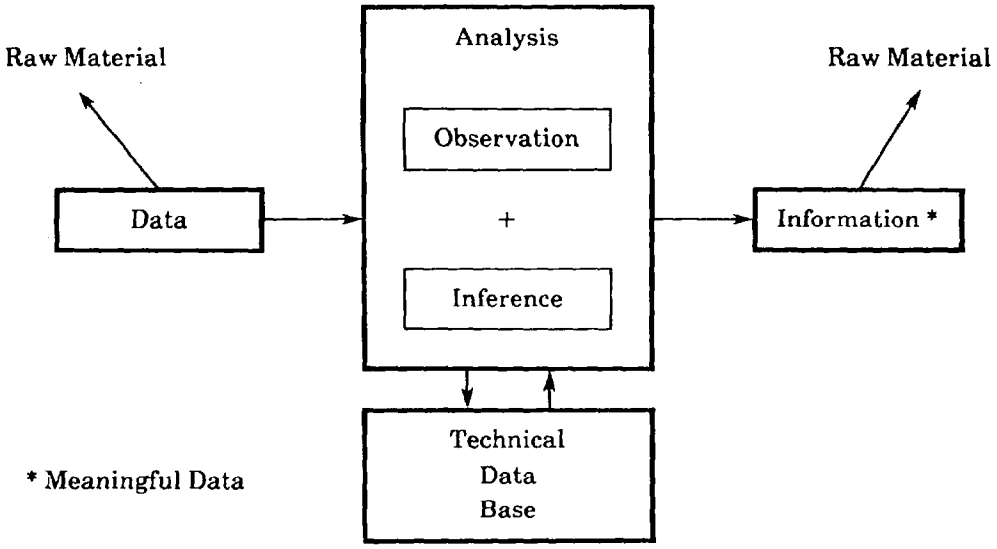

Fig. 2. The traffic analytic process

The analyst typically interacts with a technical database in this process of observing and drawing inferences. We are using the term "database" here to mean any files and records that an analyst has access to – card files, incoming hard copy of semiprocessed reports, ranging up to various computer-based files on magnetic tape, or even (in rare cases) files he can access on line with a computer.

Based on his analysis, the analyst produces information, leading to end product, which goes to consumers in the intelligence community. Much of the information may be fed back into the "technical database" to expand it and refine it.

Based on his analysis, the analyst produces information, leading to end product, which goes to consumers in the intelligence community. Much of the information may be fed back into the "technical database" to expand it and refine it.

THE TRAFFIC ANALYSIS CYCLE

Still another way of looking at traffic analysis to give us a better understanding of what happens is to consider what we shall refer to as the "traffic analysis cycle," patterned after the SIGINT cycle referred to earlier. Some persons have referred unkindly to this as the "Texan's map of traffic analysis." As you see in the accompanying chart (fig. 3), we

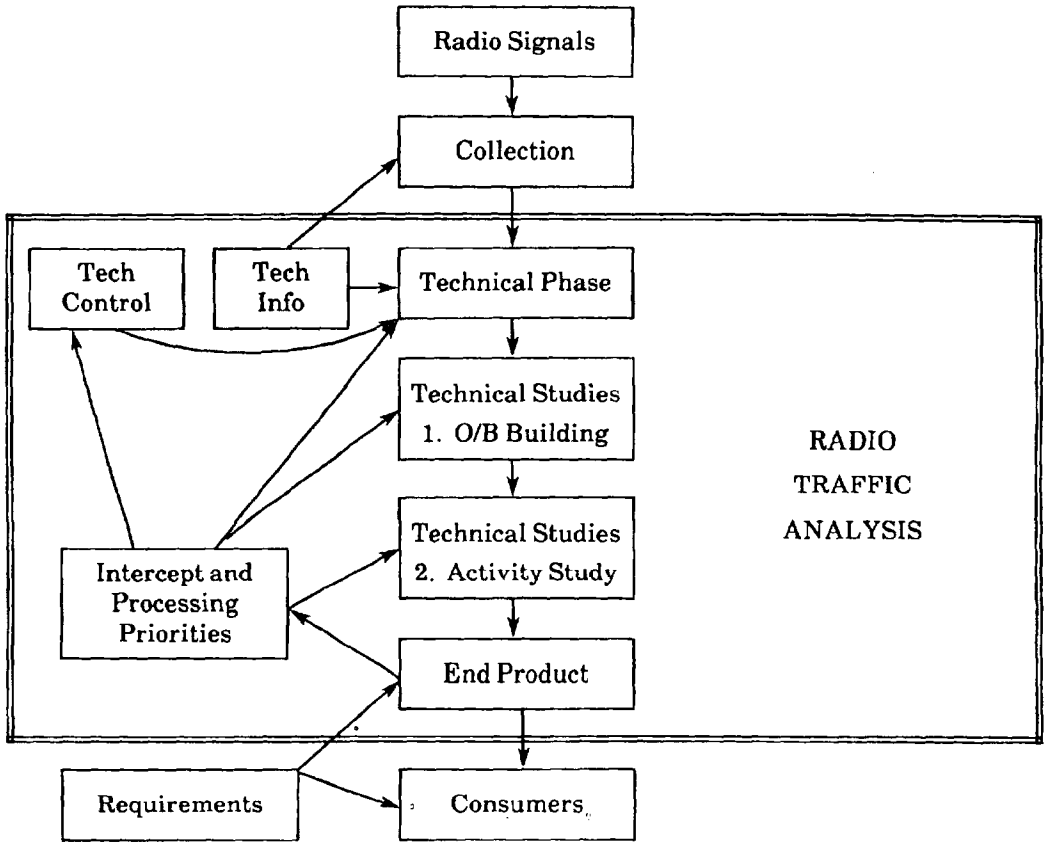

Fig. 3. The traffic analysis cycle

have set up a list of functional processes that constitute traffic analysis irrespective of echelon, things that go on between the antenna and the passing of product to consumers. In reaction to intelligence requirements, *radio signals* are *collected*, and the traffic analyst performs certain steps in a *technical phase* – things like traffic identification, net reconstruction, establishing net continuity, and drafting and issuing technical reports. These reports and cables provide a feedback flow of technical support to the intercept source. The next effort we will refer to as *technical studies (order of battle building)*. This consists of determining locations of radio stations and units, determining what organizations or types of units are involved, relationships between units, and the like.

Almost concurrently, the analyst carries on what we call here technical studies (activity study), looking into what is actually happening on the framework that is the order of battle. He looks for indications of things happening or about to happen (a whole talk could be given about the kinds of things that constitute SIGINT indicators): he studies activity generally; he establishes a formalized or general idea of what is normal; looks for phenomena or exceptions to the norms he has set; and he tries to interpret or explain these phenomena in terms of what is actually or probably happening to the target itself. We will return later to the idea of exceptions when we discuss mechanization. The analyst seeks to produce *end product* – I cannot emphasize enough that the goal of traffic analysis is producing SIGINT; all else is peripheral to that goal. The analyst should and often does produce product based upon his findings using non-SIGINT information as necessary, or he may furnish his findings to special research analysts, who may fuse the findings of several analysts with ELINT, cryptanalytic results, and with other non-SIGINT results to produce a comprehensive study.

Product is passed to consumers, completing the cycle. Feedback loops exist in our cycle, and our discussion is not complete unless we consider them. Requirements are passed from consumers to those in cryptology concerned with product matters. Based upon these considerations, all efforts represented by other parts of the traffic analysis cycle are constantly being readjusted – emphasized or deemphasized in terms of intercept and processing priorities. Technical control of the collection effort is being exercised in continuing response to these constantly adjusting priorities.

This, then, is the world of traffic analysis, working closely with other cryptologic specialists in the common goal of covering *data* to *information* to *intelligence*.

MECHANIZATION AND SYSTEMS

We would like to shift gears at this point and talk more about mechanization of traffic analysis, to establish a few logical bridges between the computer field and the traffic analysis field. First, a definition or so is in order. What is "mechanization"? It is generally agreed that *mechanization* means a process or system having an optimum mix of men and machines. The term *automation*, on the other hand, implies a system with no direct manual intervention, self-regulation within the system, and automatic "feedback"

loops. There are few examples of true "automation" in SIGINT (unless one takes a small piece of a system or a program); strictly speaking, by and large we are using much mechanization, little automation.

It may help to think of three types of "systems" that interact in any SIGINT process using machines (we will use the words "computer" and "machine" loosely and interchangeably). One must have *hardware systems* (the computers themselves, their tape drives, and communications linking them). There also are *software systems* (which, strictly speaking, are the programming systems that are available to a programmer when he begins to program for a particular application or problem). More important for us in this symposium, there are *cryptologic application systems* – programs and assemblages of equipments and programs that serve the traffic analyst, the special research analyst (formerly called the SIGINT research analyst), and the cryptanalyst. Consideration of these professions and of data banks that serve them leads us to a small digression in our train of thought.

OVERLAPS OF TA WITH OTHER SIGINT SPECIALTIES

Our cryptologic professions, and the techniques implied by them in SIGINT, complement each other to a remarkable extent. In fact, a person in any of our professions – i.e., Cryptanalyst, Traffic Analyst, Special Research Analyst, Signal Analyst, Collection Specialist, and so on – should know the rudiments of the other professions.

This overlap has some very interesting professional and cryptologic training applications. The reason I mention it today is that it has an important bearing on mechanization. We should not mechanize things in isolation without considering related problems. The cryptologic database interacts in dynamic ways. The need for interactions of data between large organizations – A, B, and G – and between analysts of different breeds, dictates applications systems designed to permit such interactions of the data, cross studies, and the like. When such matters are not considered, we may have two, three, four, or more databases containing essentially the same data in different, incompatible forms. The *standards* implications of what we are saying should be apparent, both at the *data element* level and at the format level. We shall have a few more words later on formats.

SOME TRAFFIC ANALYSIS MECHANIZATION IDEAS

At this point, I would like to toss out a number of ideas and terms. Most machine help to traffic analysis today still consists of *batch* processing, much like the so-called "IBM Runs" of Japanese traffic of almost thirty years ago that I mentioned earlier. We are getting more and more sophisticated, I suppose, but it is still "batch" processing – daily, weekly, monthly, etc. There is some *on-line processing* going on. Here, I mean processing where material is coming in on a signal line from the field, is going directly into a

computer without being handled manually, and some processing is being done to it before people see it. [redacted] will be discussing some on-line applications of this type. Also, on-line can refer to on-line inquiries at a console station connected to a computer; our capabilities in that direction are growing slowly but surely. I do not mean to convey the impression that on-line processing is necessarily preferable to batch processing; each has its place and will continue to have its place, dependent upon the nature of each particular TA problem.

We referred earlier to data standards. The Department of Defense is pushing very hard in the area of data standards (and in hardware, software, and media standards, for that matter). We at NSA must consider these Defense-wide standards seriously, but because of the special problems we run into in cryptology, we are not able to use them "as is" very frequently. The comptroller and personnel organizations (who have more occasion to deal with DoD people and whose data banks interact to a greater degree) are able to use these DoD standards directly to a much greater extent. Without defining the terms rigorously, let me say that data standards are of three types of things: Data Elements (classes of data), Data Items (things that appear in these classes), and Data Codes (short abbreviated codes for either elements or items, to be used in a data bank or descriptions). Collectively, these are referred to as *Data Features* Although some find even the idea of data standards distressing and distasteful, let me underline their importance. We simply cannot build large, useful data banks without seriously building and using standards. Dr. [redacted] will be having some comments on the need for standards and the special problems that the overlapping and competing of national and international standards organizations create for NSA and cryptology.

In the business world, managers have found that they cannot possibly look at all the data relating to their particular concern – whether it is running a production organization, supervising a sales force, or whatever. To make it possible to control an operation effectively, a technique called *management by exception* is being applied effectively. Rather than having a huge pile of material presented to him in the morning for study, the manager using "exception" techniques will specify that he is interested, say, only in the information relating to the top three and the bottom three salesmen's records for the previous period; or he may set certain upper and lower thresholds, or "norms," and call for production and sales figures only for the departments and employees who exceeded or fell behind the norms. Computers are superbly equipped to provide reports answering such questions.

The same idea has always been used in manual traffic analysis, and we will be seeing sharply increased use of "analysis by exception" techniques by machine in the future. To use the technique, a traffic analyst studies his material, establishes norms for events and occurrences, and asks for a machine search to find deviations from these norms. Output provided him shows these deviations (or exceptions); he studies them and draws appropriate conclusions. He may have to readjust norms as time goes on, since what is "normal" changes in time. New norms would be reintroduced in the system for all subsequent processing until a new adjustment is necessary. It goes without saying that

exceptions to the norms are quite likely to contain the "goodies" that will result in end product of value to consumers – thresholds must be so designed that this will be the case.

Without getting too deeply into the subjects, I would like now to discuss *algorithmic* versus *heuristic* problem solving. An algorithm is any definite, specific procedure or formula that, when certain data are put into it, and the procedure is followed, yields certain answers that are always the same. Simple arithmetic problems, algebra, and so on, are examples. Algorithms need *not* be numerical – the machine world abounds with examples dealing with all kinds of data. Heuristic problems, on the other hand, are those that are loosely structured or are so new that approaches must be discovered. Heuristic methods may be "rule of thumb" approaches, may seem to use "intuition," and may be probabilistic (at least not deterministic); one does not necessarily get the same answer, or any answer, to a particular problem. Chess, checkers, and various board games fall into the class of heuristic problems; so does intelligence gathering, and especially so does traffic analysis. Whereas most problems of an algorithmic nature can be readily programmed to be handled by computers, heuristic approaches are much more difficult. Some progress has been made in recent years in preparing "heuristic programs" for computers, and it is hoped that there will be a spillover into our field. Some of the things that speakers will be discussing these next few days have "heuristic" features – watch for them.

THE TRAFFIC ANALYSIS MECHANIZATION PROCESS

I would like to take a look at traffic analysis mechanization in several ways. Essentially, in TA mechanization, we are manipulating *sets* of data. Today's youngsters who are learning about sets in school will probably be better traffic analysts than we were – at least they will have the benefit of some theory relating to ideas that we have been using but had not had formalized for us.

I would like to consider TA mechanization trends over the years in terms of the traditional INPUT - PROCESSING - OUTPUT breakdown. I shall mention some dates – please regard them as approximate. They are based largely on my recollections. Communications developments play a most important part throughout. What is really happening is that TA mechanization has gone global; not only are we eliminating or reducing key punching, carrying punched cards across the room, and so on, but are doing it on a worldwide scale.

INPUT

Input developments have kept pace with industry developments and have often led them. From the early 40s until 1965, TA data were punched from hard copy traffic onto punched cards or punched paper tape, introducing errors and delays. Electrically transmitted traffic and summaries were recorded on punched paper tape for later machine processing. You will be hearing about some significant improvements in the area of input

– AG-22 intercept typewriters (to be replaced in the future by the Improved AG-22 Typewriter System, or IATS), and FLEXSCOP (Flexible SIGINT Collection Position, incorporating a CP-818 computer). These devices and systems solve many but not all of our input problems.

Improved communications are giving us a path that is increasingly direct from intercept antenna to computer at NSA, with a minimum of manual intervention; at least that is the goal. CRITICOMM has been serving as an interim system, and the high-speed data link project termed STRAWHAT is now coming to fruition. Magnetic tape communications terminal devices in C Group (Projects MESHER and MUSSER) are parts of the antenna-to-computer system.

FORMATS

Trends in analytic formats have been similarly marked by distinct improvements. By formats here I mean methods of preparing and forwarding data for higher echelon processing, either machine or manual.

From the early 40s until 1951, the message heading itself was the format (in slightly edited form). Even during this period, there was some experimentation going on with direct machine input of electrically forwarded material. In 1943, a group of young GIs were sent to USM-2, Petaluma, California, for just such a project. We edited material for poking and electrical forwarding; the traffic was to be converted automatically to punched paper tape at the Arlington Hall Station end of a cross-country circuit. The tape was then to be converted to punched cards for subsequent EAM processing. It was not until later years that I discovered that errors on the cross-country circuit were so great that the material was not useful without substantial reediting and repunching; this experience accounts for much of my past skepticism about communications lashups.

In 1951, the "signalled log digest" (or LOGEX), the first true electrically forwarded analytic summary, was begun. [redacted] P.L. 86-36 EO 1.4.(d) The concept of forwarding the results of each echelon's analysis to the next higher echelon so that analysts could start from that point was born here. The signalled log digests were really a slightly altered version of hand logs, forwarded by signal, even producing a space on the teletype print for analysts to draw a diagram, based on the "verbalized diagram" in the message. This early signalled material was neither intended nor suited for direct input into machines.

In the late 1950s, *MATSUM-type formats* were begun. These were similar to the signalled log digests but contained fielded data intended for subsequent EAM (punched card) processing. The Army Security Agency (ASA) in Europe pioneered this effort, and

NSA picked up the idea – the time and the situation were ready for the advance. Many similar formats for electrical forwarding were created and used over the years.

About 1967, *modular-type formats* began to appear. The best examples are the STRUM (Standard Technical Report Using Modules) and the FF STRUM (Fixed Field STRUM). As most of you know, the STRUM of a particular type is made up like a recipe, with whatever modules are necessary for the particular problem. I strongly believe in the modular approach and think that it is proving itself in practice. STRUMs contain some fielded information, but also have flagged and tagged information in the various modules.

Beginning in the late 1960s, *machine-generated reports* produced by field computers from AG-22 tapes started appearing. The first were the TRAPEZE project, [redacted] More recently, a version of the ELFAIR, a [redacted] has been computer generated and forwarded. There are undoubtedly others that we have not named. P.L. 86-36 E.O. 1.4.(c)

COMPUTERS TO THE FIELD

Ten years ago it was unthinkable to send computers to the field, but George Vergine, always about ten years ahead of his time; was suggesting sending out computers for field processing purposes. About 1964, [redacted] wrote a paper strongly recommending the IBM 1401 as the ideal field computer and headed up an early effort to develop programs for field use. Today we have many, many computers at our intercept sites, working with collection, doing conversion, editing, manipulating data, performing product-related tasks, and so on. P.L. 86-36

PROCESSING

A few words about the kinds of processing we have done using computers are in order.

In the early 1940s, in fact until the mid-50s, it was mostly sort and list of message externals. I would like to reemphasize that the sort and list is still the workhorse of our business, despite all the fancy kinds of processing being done or tried.

By the mid-1950s, callsigns were being handled by computer, keys were being decrypted, and some early work on DF plotting had been done.

Programs to produce analytic *summaries* were first started in the mid-1950s. The computer began giving us totals, groupings of data, without giving us back all the input data. This was perhaps the real beginning of TA data reduction by computer.

More fancy things are being tried and have been proved workable. [redacted] will be telling you about the "Traffic Analysis Processing System" (TAPS), which includes some quite advanced ideas. Such things as net reconstruction, net continuities, and various recoveries are being done by computer in special instances; you will also be

hearing about some examples of *alarm systems* based on thresholds and exception reporting.

OUTPUT

The nature of output for the benefit of TA and SIGINT generally is sharply changing. Data links work both ways and provide us the capability of moving output directly to the field for their use.

We have already referred to conventional sorts and lists as typical computer "printouts." Matrix output, in which data are displayed at the intersections of row and column coordinates, has been around for about ten years now and is being used in a number of problems to advantage. Matrices are particularly good for displaying TA data summaries.

Computer graphics, which include the whole area of X-Y plotters and cathode-ray tube output devices (producing so-called "soft copy"), are undergoing a surge in popularity right now and show great promise for even further TA applications. Some such devices display only "alphanumeric" data, and others show either characters or lines, which can make possible the display of graphs, non-Roman characters, and even net diagrams.

Map overlays are an excellent example of such an application. I believe that Mr. [redacted] will be showing you an example of an Airborne Radio Direction Finding (ARDF) map overlay, which illustrates both the idea of computer graphics and of exception reporting. The analyst is presented with an overlay showing *only* DF fixes that are within a radius of twenty-five miles of key South Vietnamese cities. P.L. 86-36

The list of types of output to serve the traffic analyst could go on and on. Some examples that deserve mention are *updated databases*, the generation and *preparation of reports* for reproduction, and the *preparation of messages* for electrical forwarding.

To round out the picture, and to keep everyone honest, I would like to touch on some of the classic *problems* and advantages that people are encountering in TA mechanization.

PROBLEMS IN MECHANIZATION OF SIGINT

Some of the problems we are going to mention have changed somewhat since we first compiled this list a few years back. Some are much greater than they formerly were, and others have practically disappeared. Problems that might be cited are

a. Objections to mechanization, as such

b. Need for a back-up capability

c. Problems in the data

1. Changes in the database
2. Garbles and corruption ("garbage in, garbage out")
3. Volumes of material (now often cited as an advantage, because of input breakthroughs)
4. Data preparation problems
5. Diversity of analytic problems

d. Problems in defining logic

e. Problems in getting at the data in storage

f. People problems (carelessness and human errors in programming, data conversion, or data preparation)

g. Problems with "systems" (some systems are truly too large; others should be designed to interact but are not; the standards problem, etc.)

h. Hardware problems ("down time"; computers in the field experience environmental difficulties, etc.)

i. Delays in getting results (this is really a matter of relative priority of problems)

REASONS FOR THE MECHANIZATION OF SIGINT

Despite all the problems just cited, there are a number of overwhelming reasons why mechanization must be considered, and why for many problems it is already an indispensable part of the processing effort.

a. Business vs SIGINT reasons (timeliness is more important in the case of SIGINT; cost may be an object, but the costs may be far greater not to use mechanization)

b. Timeliness

c. Accuracy (there is accumulating evidence that the use of AG-22s may increase the accuracy of input into our machine processes)

d. Mechanization of target communications methods

e. High volumes of raw data

f. Derivation of new information from large information banks

g. Processing of solved SIGINT systems

h. Research into unknown and changed systems

i. Larger look at data relationships (through information retrieval systems)

SOME CLOSING THOUGHTS ON TA MECHANIZATION

We had a serious communications gap between traffic analysts and computer people a few years back. Now, enough people have crossed the fences in each direction that things are greatly improved; there is increased understanding on both sides of the fence.

The integrity of data in machine files is a matter of concern. Somehow, we must preserve the total context of transmissions and provide an "audit trail" through machine analysis, so that we can always find out how certain conclusions were reached and what was actually transmitted in the first place. Also, the need for the simple inclusion of *validities* in machine records is a matter of concern. Things are seldom certain, but when we do not show a degree of validity, we imply that they are.

A final word on standards. I am not sure that completely "standard formats" are the right goal, although I am a staunch believer in modular formats, with many modules, appropriate for problems X, Y, and Z.

The slowness in developing workable data standards may or may not be our most serious single bottleneck in the whole area of mechanization. We must move more rapidly in standardizing data features – how we express things, irrespective of formats. Databases and retrieval systems demand this. There needs to be a more considered attempt to interweave A, B, and G Group processing systems. In fact, each office has not one but many processing systems. The key to what I am saying lies in the use of effective data standards, I believe, not in the creation of a large "system."

In conclusion, the future of TA mechanization looks bright. I can foresee the continued preparation of manually prepared modular-type formats for a long, long time in the future, but on a reduced scale. I believe that machine-produced summaries based on AG-22 output have a great future, but I would like to emphasize three things:

a. In using AG-22s in this manner, we are essentially moving the point of analysis from one place to another; with communications improving, we can do this.

b. We must make it possible for the analyst to get back to the total take, in some manner, if there is the need to do so.

c. An adequate "alternate system" or path must be provided to ensure that vital information, technical feedback, and intelligence can continue to flow in the event that data links are down. The use of modular-type formats as an alternate, backup procedure for all AG-22 installations in probably the best answer to this concern; this implies the continued need for some analysts at field sites.

I hope that I have sounded neither too pessimistic nor too optimistic today. There are a lot of very real problems emerging in TA mechanization – high error rates on summaries, humidity and dust interfering with operations, machine breakdown, escalating costs, and so on, but on the whole, we are moving ahead.

I am looking forward to hearing what the other speakers have to say and to further forums of this type in the future. Thank you.

Automation of a TA Process

TIM MURPHY

[redacted]

What few people realize is that the workload associated with the Southeast Asian (SEA) problems did not decrease as U.S. forces withdrew from Vietnam and as B3 (previously B6) underwent successive personnel reductions. In fact, the amount of SEA communications intercepted and processed at NSA was still peaking in 1975 when the South Vietnamese government fell. [redacted]

P.L. 86-36
EO 1.4.(c)

Traffic analysts have borne a proportionate share of the decrements incurred by B3, yet there has been virtually no drop in target communications. Analysts have been assigned larger case loads and have assumed responsibility for collection management; yet, in my view, the quality of analysis has improved, and the analysts, in general, are not overworked. There is little doubt that technical support to field stations has improved significantly.

The automation of a large segment of the SEA traffic-analytic processes has been the key not only to high-quality analysis but also to our ability to do the job better over the years with fewer people. Fortunately, during the early stages of U.S. involvement in Vietnam, managers with the Traffic Analytic Support Division for the Vietnamese problem took an enlightened view toward mechanization. With help from some of the Agency's leading traffic analysts and a cadre of highly qualified data-systems personnel, the first steps toward an automated traffic-analytic process were taken.

[redacted] At the same time, we began a major effort to mechanize our analytic findings and create a single processing system. In addition to transmitting our analytic findings to field sites, we also used their data to create identification dictionaries that became the heart of our match-ident process. [redacted]

[redacted]

P.L. B6886636
E.O. 1.4 (c)(c)

Of equal importance to these contributions was that the methods the experts used and the approaches they took to the TA task rubbed off on many of the junior analysts, with outstanding support first from C5 and later from B42, continued this trend toward automation, always striving to relieve analysts of most of the repetitive TA tasks and to permit more time for actual analysis. Among their major contributions were

- the creation of a single analytic database – the Southeast Asian Case File (SEACF)

[redacted]

In addition, the availability of on-line access to our database in recent years through the COPE terminal has led to many analyst-initiated special programs that have greatly expanded the analysts' capacity for research. I should also point out that field stations tasked against SEA targets have also taken many initiatives toward automation.

SEA MACHINE DATABASES, PROCESSES, AND RESOURCES

SEACF

Perhaps the most significant single step toward reducing the workload of SEA traffic analysts was the creation of the Southeast Asian Case File (SEACF). The SEACF not only resulted in highly efficient database management, but also permitted many follow-on processes that greatly reduced the workload of SEA traffic analysis.

Many of the processes introduced during the early stages of the Vietnam War to mechanize the TA process required the establishment of databases to support them. As those processes expanded, the number of databases expanded to the point where analytic time saved was being spent on database maintenance. A review of those databases revealed that there were a large number of common fields of information but comparatively few unique fields. In effect, we were multiplying our file-maintenance workload and making ourselves vulnerable to contradictions between identical data items in different databases. The major databases that had to be maintained prior to the implementation of SEACF were

[redacted]

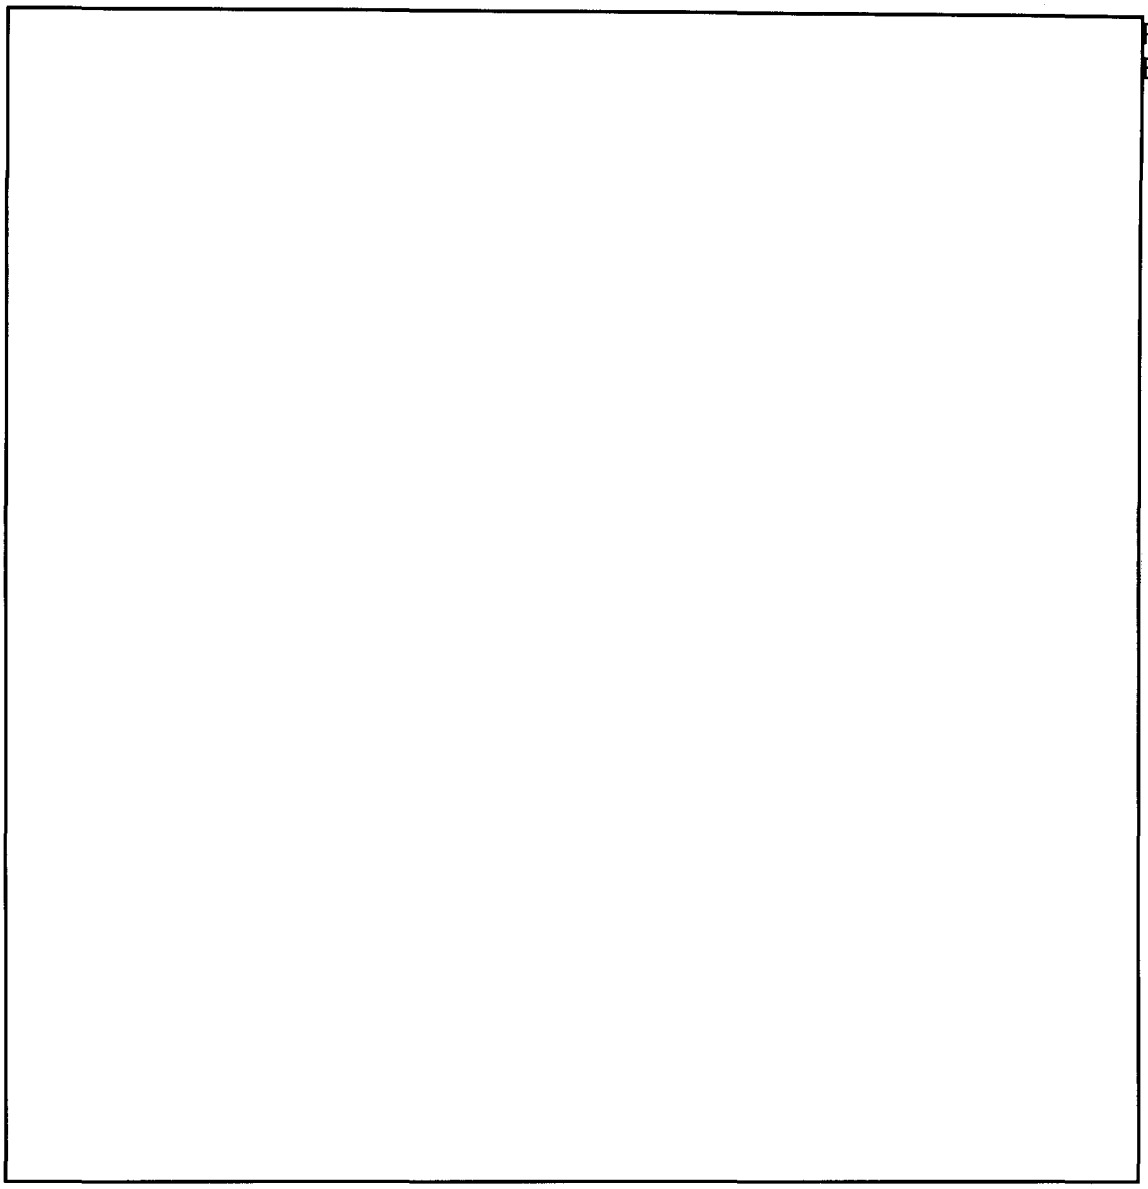
[redacted]

P.L. 86-36
E.O. 13526 1.4(c)

The SEACF consolidated all these data elements into a single database, thus eliminating the requirement to maintain those multiple databases. Since its establishment, the SEACF has been expanded to include data elements that support both cryptanalytic and collection-management functions.

As now constituted, the SEACF consists of eight basic data records which analysts use to provide permanent maintenance of the communication and crypt characteristics of a given target, identification and location data on that target, and collection-management data.

[redacted]



P.L. 86-36
E.O. 13526 1.4(c)

It was inefficient and time-consuming for analysts to collate all these varied inputs, yet very necessary from an analytic standpoint. Hence they were eventually collated by machine as part of our daily process, and our activity database is now a composite of all primary-source technical inputs.

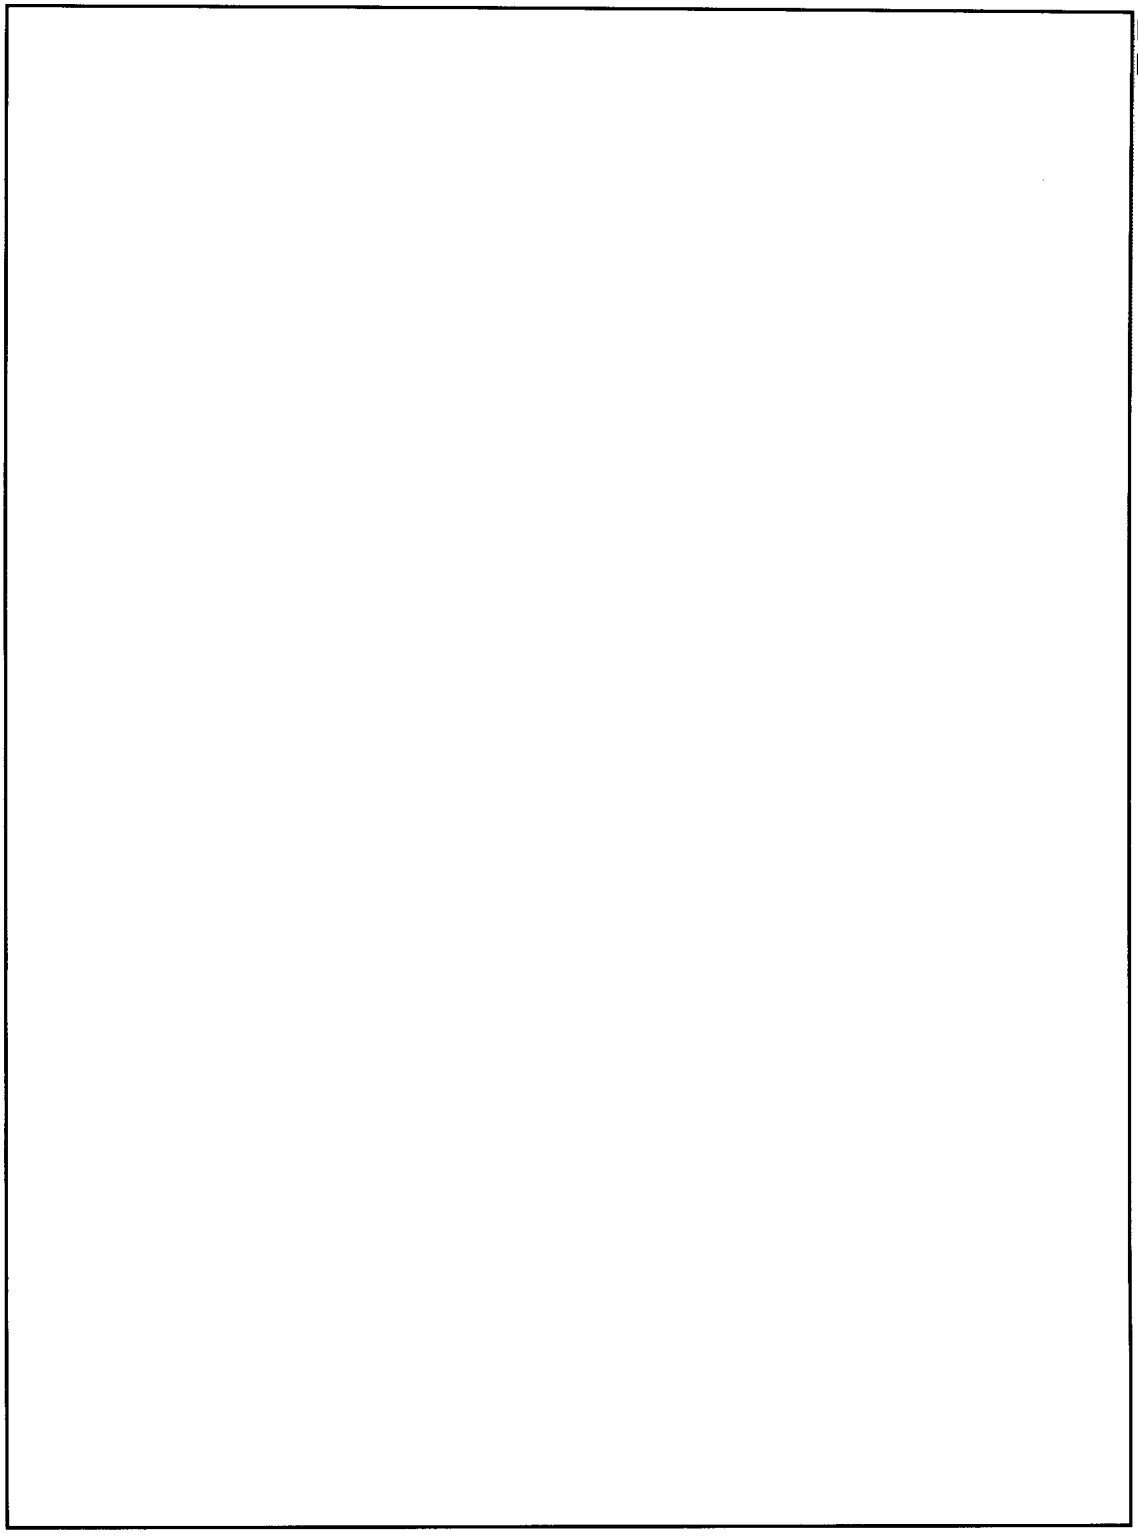
IATS [redacted]

Another major step in automating both the traffic-analytic and the traffic-forwarding processes was the implementation of IATS. The user routine developed for SEA communications copied on IATS or AG-22 intercept positions [redacted]

P.L. 86-36
EO 1.4.(c)

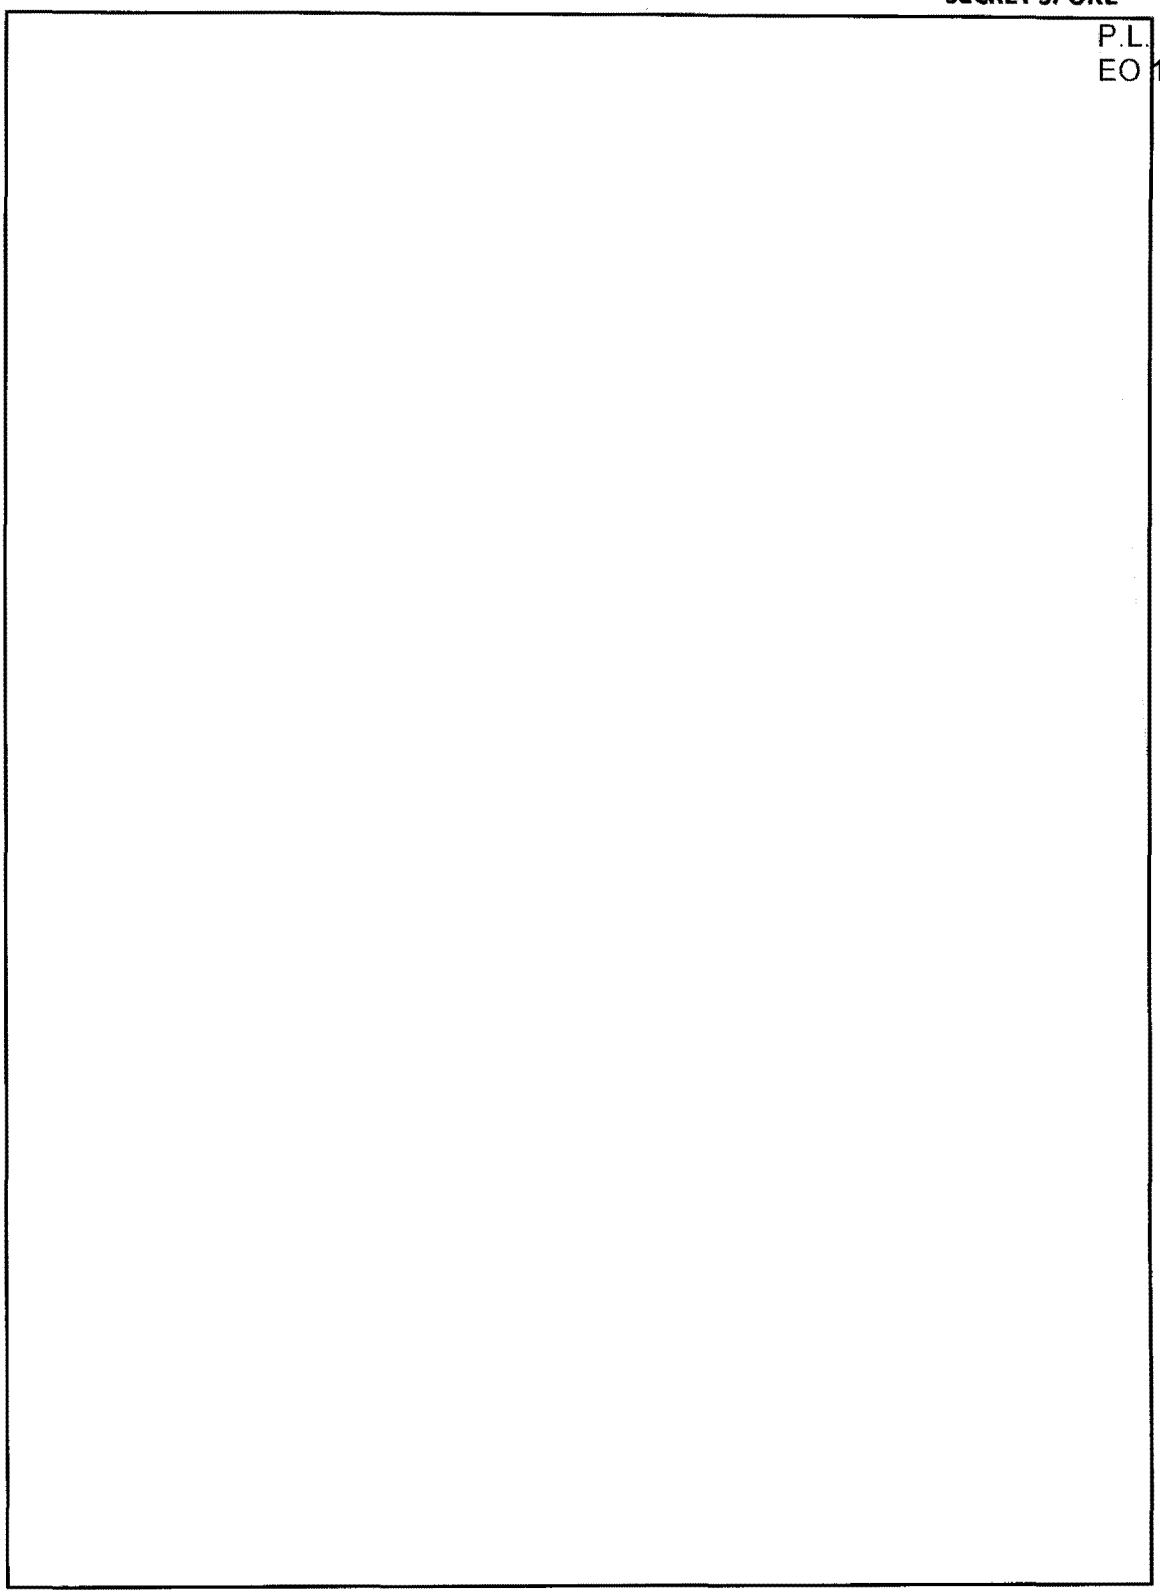
This program reduced by countless hours the task of the SEA development analyst. To a large degree, the analyst has been able to rely on the machine to isolate new continuities and then concentrate his or her efforts on identifying that continuity to region or function. The number of analysts tasked against the development problem was reduced from forty-five to ten between 1972 and the spring of 1975 with no adverse effect on the mission. Much of the credit goes to the SEADEV process.

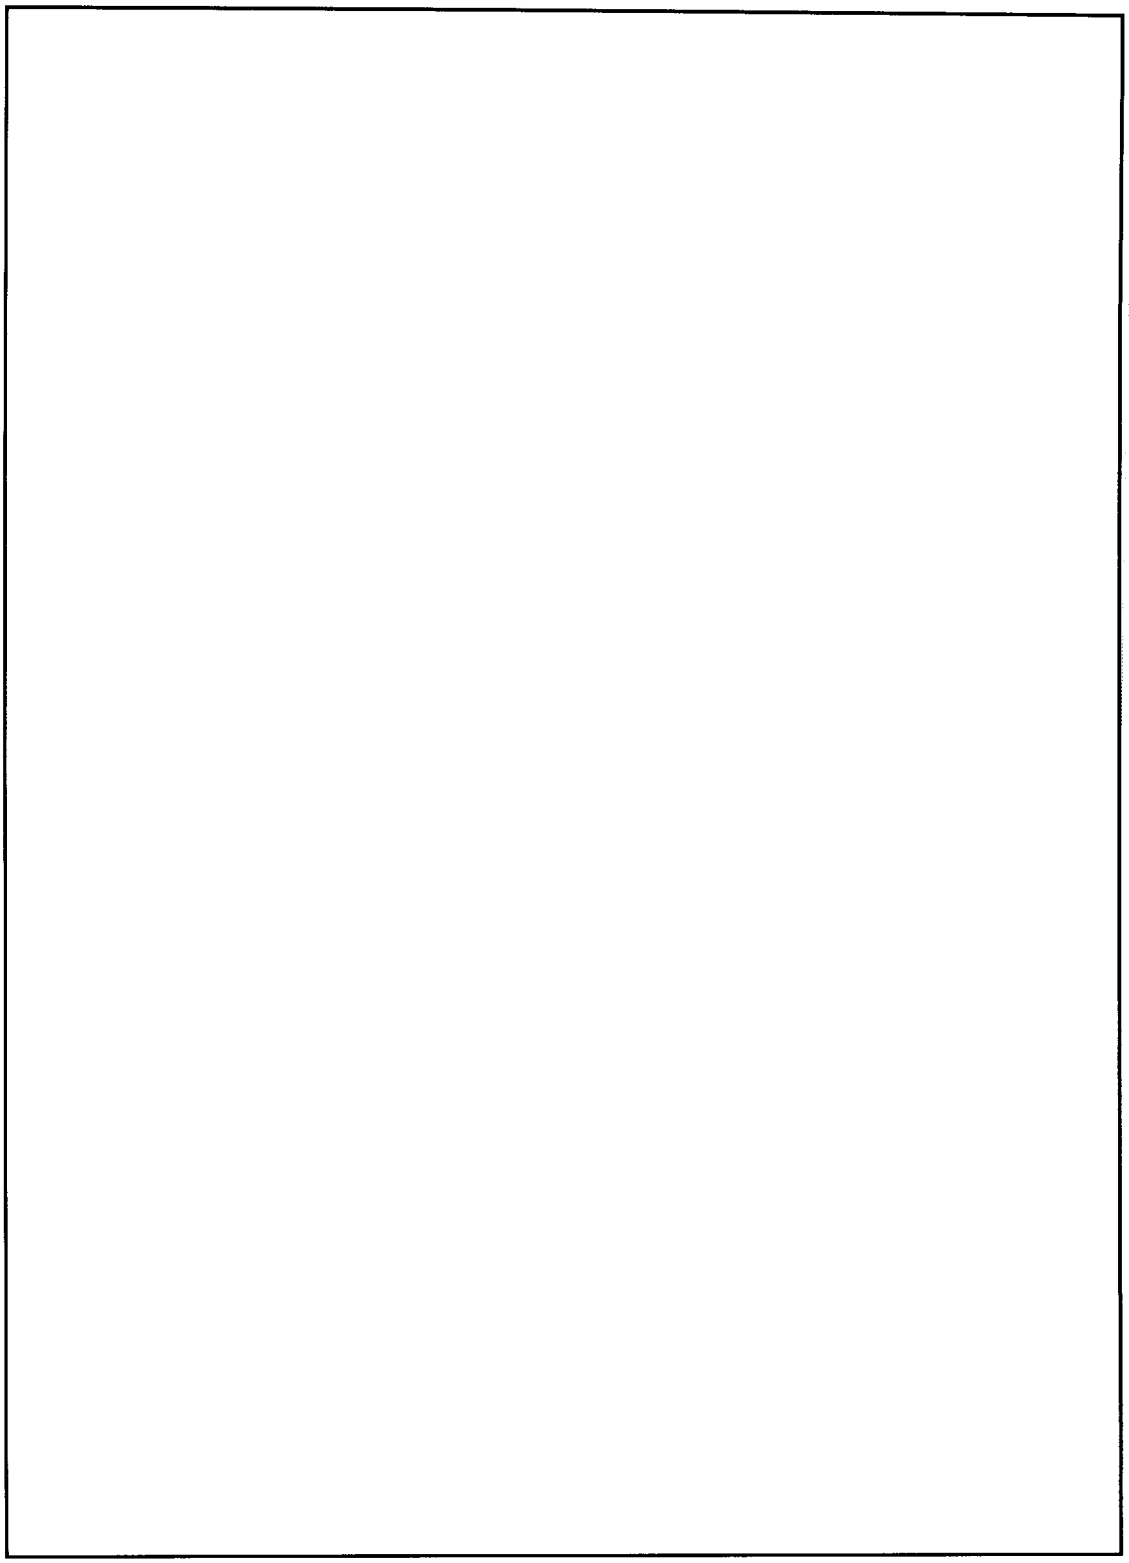
[redacted]



P.L. 86-36
EO 1.4.(c)

P.L. 86-36
EO 1.4.(c)





P.L. 86-36
EO 1.4.(c)

P.L. 86-36
EO 1.4.(c)

IMPACT OF AUTOMATION

In summary it can be said that the impact of automation on the SEA problem has significantly reduced the number of analysts required to do the job. The caliber of analysts required has increased, however, since their primary remaining function is pure analysis or, to use another term, "thinking." Many of the crutches that have kept analysts busy over the years (e.g., logging, sorting traffic) are gone.

To function effectively, SEA analysts must have an understanding of their databases and of how machines can be used to manipulate the data they contain. Imagination is currently a key asset since much of what can be imagined in terms of analytic approaches is now feasible. There is an increased demand for the traffic analyst/programmer. Knowledge of the SPECOL retrieval language is becoming a highly desirable attribute of the SEA traffic analyst. In short, the impact of TA mechanization needs "a few good analysts."

How Clean Does a Database Need to Be?

[redacted] P.L. 86-36

One of the first things one learns about computers is that they require a much higher order of accuracy in the material they manipulate than do comparable "human" processes. One learns to pay an extra measure of tribute in the form of added proofreading or other forms of quality control, so that the input is "clean" enough for the computer to handle.

After a while, as the novelty wears off, it sometimes occurs to one that not all of the data need to be so awfully clean. If we expect to sort or retrieve on a particular field or data element, then that field or data element should be clean and garble-free; but if a neighboring item is never (well – almost never) used as a control for sorting and retrieving, then it only needs to be as garble-free as *people* need. Quite clearly, if only half of your data elements really *need* quality control, then some of that manpower now spent scrubbing each little data element might be diverted to other tasks.

It is possible to imagine categorizing data elements as "first order" if they need to be "computer clean," and as "second order" if they need to be only "people clean." P.L. 86-36 EO 1.4.(c)

In this day of great monolithic databases, however, the use of varying quality levels can cause troubles, however laudable their manpower savings may be. A story "from life" will illustrate.

Some years ago, during the Vietnam War, we found ourselves receiving two streams of electrical material from the sites in the field, and both streams were used to feed computer processes [redacted]

The second was a cryptanalytic stream. A [redacted]

The specific details of these processes belong to another story (or series of stories). The point here is that there came a time when there was an operational need to identify which messages [redacted] It should have been easy. Neither system was new, and both had been working for quite a while with

reasonable success. (Success is a relative term; there were always problems, sometimes earthshaking problems, but by and large, the systems did work.)

[redacted]

It took a while to find out why, but after a time the answer became clear. Evidently the people at the sites, knowingly or unknowingly, practiced different levels of quality control on the various data elements [redacted]

All of which suggests several thoughts.

Garble rates can often be determined, at least approximately, by machine. Certainly differential garble rates can be (Field 1 has more or fewer garbles per thousand than Field 2). If databases that now exist were measured to show which data elements were "cleanest" and which were "dirtiest" (perhaps arrayed in a sort of quality hierarchy),

- the unwary might be warned off using the database for sorting or controlling on the wrong (dirtiest) data elements;
- hit thresholds might have to be lowered when dealing with "dirty" elements, even at the expense of wading through more "garbage" output;
- managers might better understand the manpower costs of various control strategies; but also
- we might decide that great monolithic databases are not always the answer when one must work with a variety of data sources having widely different notions of which items are "important."

The Hand Is Not Quicker Than the Eye

P.L. 86-36

[redacted]

Many years ago I was told that "a good analyst" does his own logging, counting, and tallying. While at first I admit I thought I was being set up to do all the menial labor (my son calls it "the donkey work"), it wasn't long before I saw that the senior people around me *did* do their own logs, and counts, and tallies – not always, but much of the time.

I can remember more than one callsign problem when the callsigns had been extracted (by hand) from some sort of generating matrix and inscribed (again, by hand) into pages. Often the markers of the pages would begin in an attempt to be very "random," but boredom and inattentiveness quickly set in and both processes, extraction and inscription, slowly became more orderly and regular. Near the end, as fatigue set in, the processes became virtually mechanical. Such "handwriting" patterns – top to bottom, left to right – are sometimes so strong that one can convert pages from arbitrary to true base on this feature alone. On a problem like this, one can deal with the problem on a statistical basis – one can even convince one's statistically/mathematically minded friends of the truth of one's solution – but the acid test is to sit down with pencil and cross-section paper and, by hand, duplicate the process, callsign by callsign. If your solution is right, you see it and you'll *feel* it intuitively.

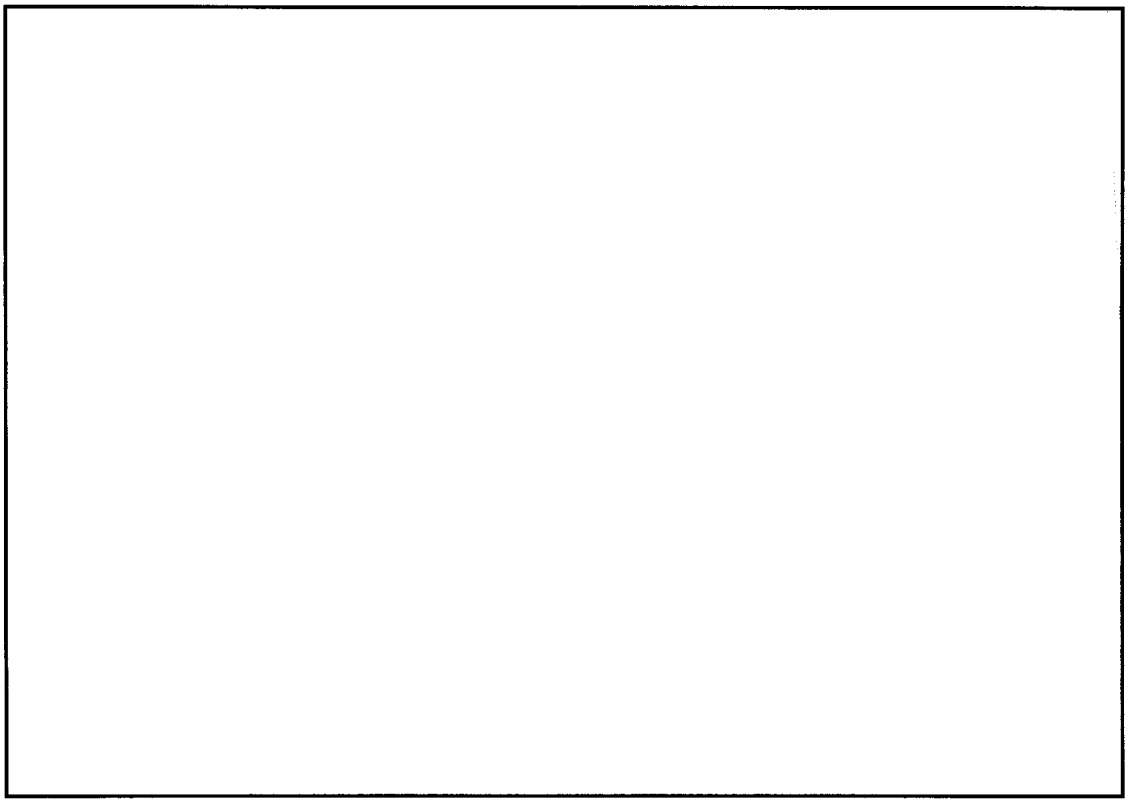
In both of these processes, we gain analytic insight by doing it ourselves. Logging brings us into contact – a kind of slow-motion contact – with the material we are studying. I don't know about you, but I know that I have *discovered* more things while logging, or counting, or tallying, or some other donkey work than I have while sitting there looking at the results of the logging/counting/tallying. Especially the discoveries that were unexpected – outside the range of what I *thought* I was going to find. In the extraction/inscription kind of problem, the insight comes as my hand follows the hand of the enemy signal officer. Why did he stop just there? What made him jump over (or away from) that callsign?

Nowadays we are told that the computers are going to do all things for us. But what happens to that intimate contact with the material when the original traffic – if you can call it that anymore – is deep inside a computer somewhere and all you've got to look at is some computer output? Well, some of us still find a way to do some hand-logging. And not just because we can't get responsive software support (that's a subject for a separate article). We *want* to log! It helps us touch the material. It's like buying a piece of land and not being satisfied with topographic charts – you have to go out and walk all over it. Then you begin to *know* the land.

P.L. 86-36
EO 1.4.(c)

I have always had the notion that someday interactive computers with *screens* might begin to meet this "touching" need of the analysts. [redacted]

~~CONFIDENTIAL~~



Has anybody done this sort of thing or ever seen it done? If it works, I'd sure like to stop all this logging!

The Lost Indicator

DR. RALPH W. JOLLENSTEN

INTRODUCTION

The purpose of this talk is to describe the type of questions that arise when a math problem is encountered in TA. Although some would argue that the problem discussed here is not strictly a TA problem, the underlying general principles are the same as those for a purely TA problem in which math is needed.

PROBLEM

A certain country has been sending military traffic in five-digit groups, using the fifth group (A5) of the message text as the indicator group according to the following rule:

Air traffic – the digits of the group sum to 23.

Army traffic – the digits of the group sum to 24.

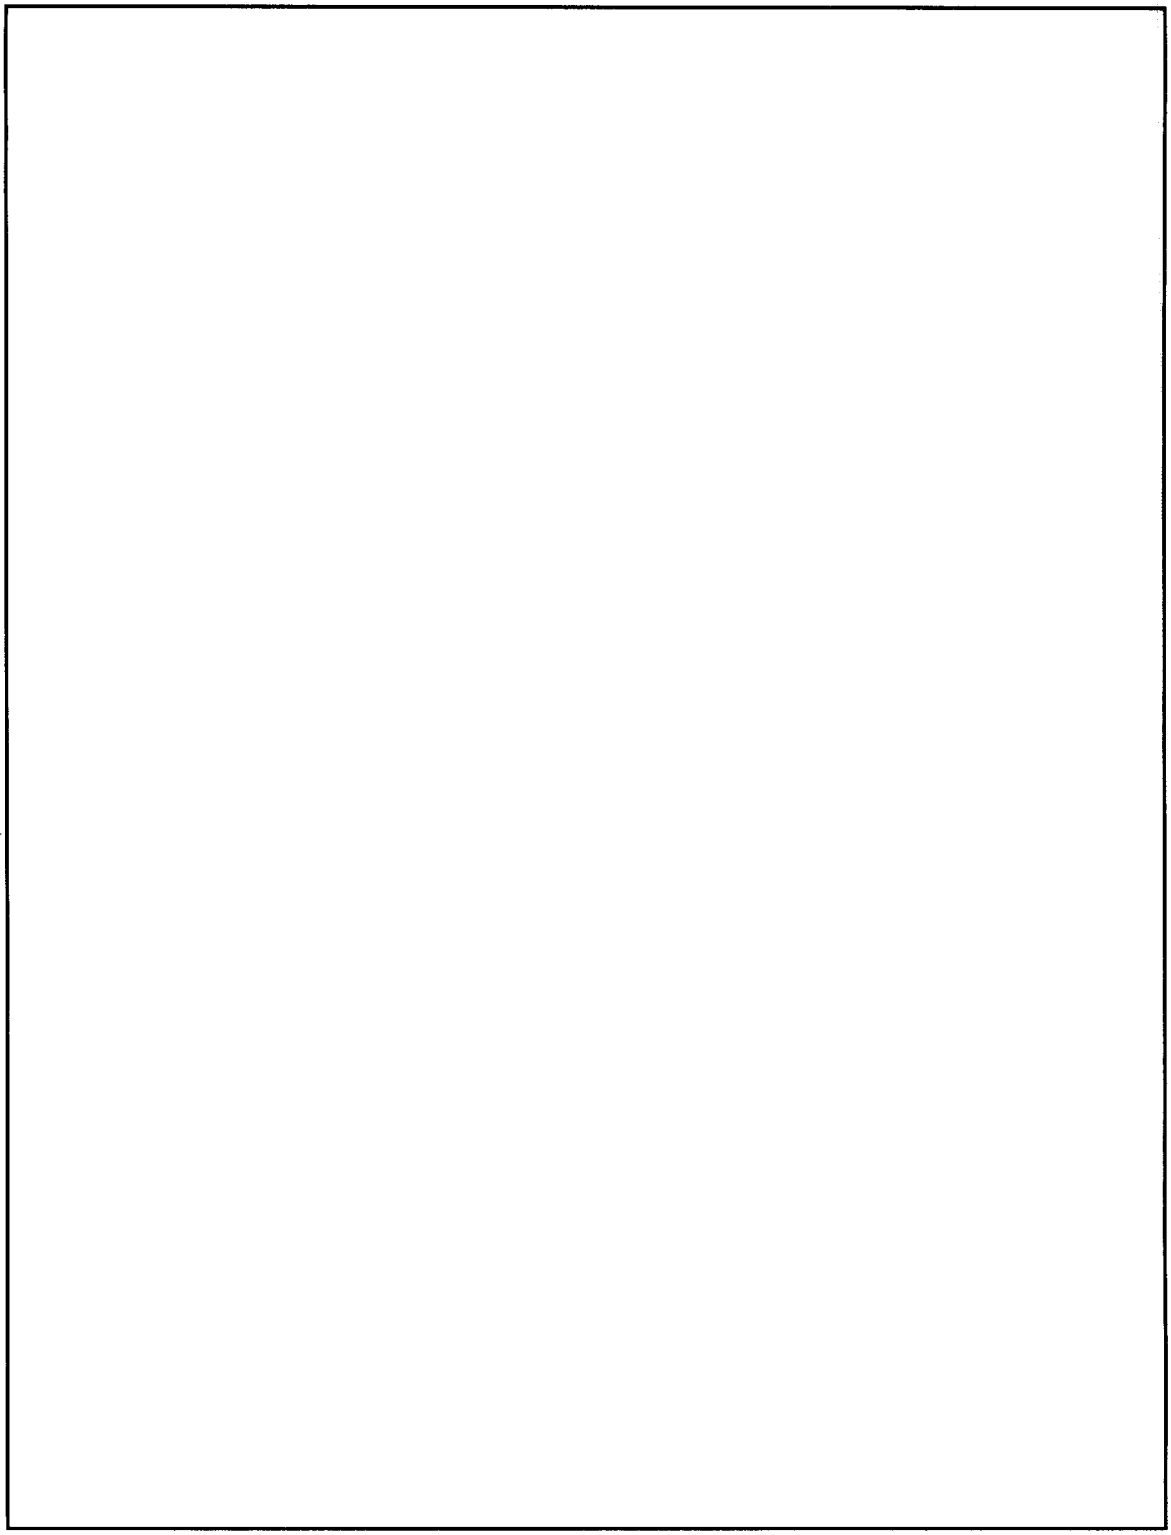
Navy traffic – the digits of the group sum to 25.

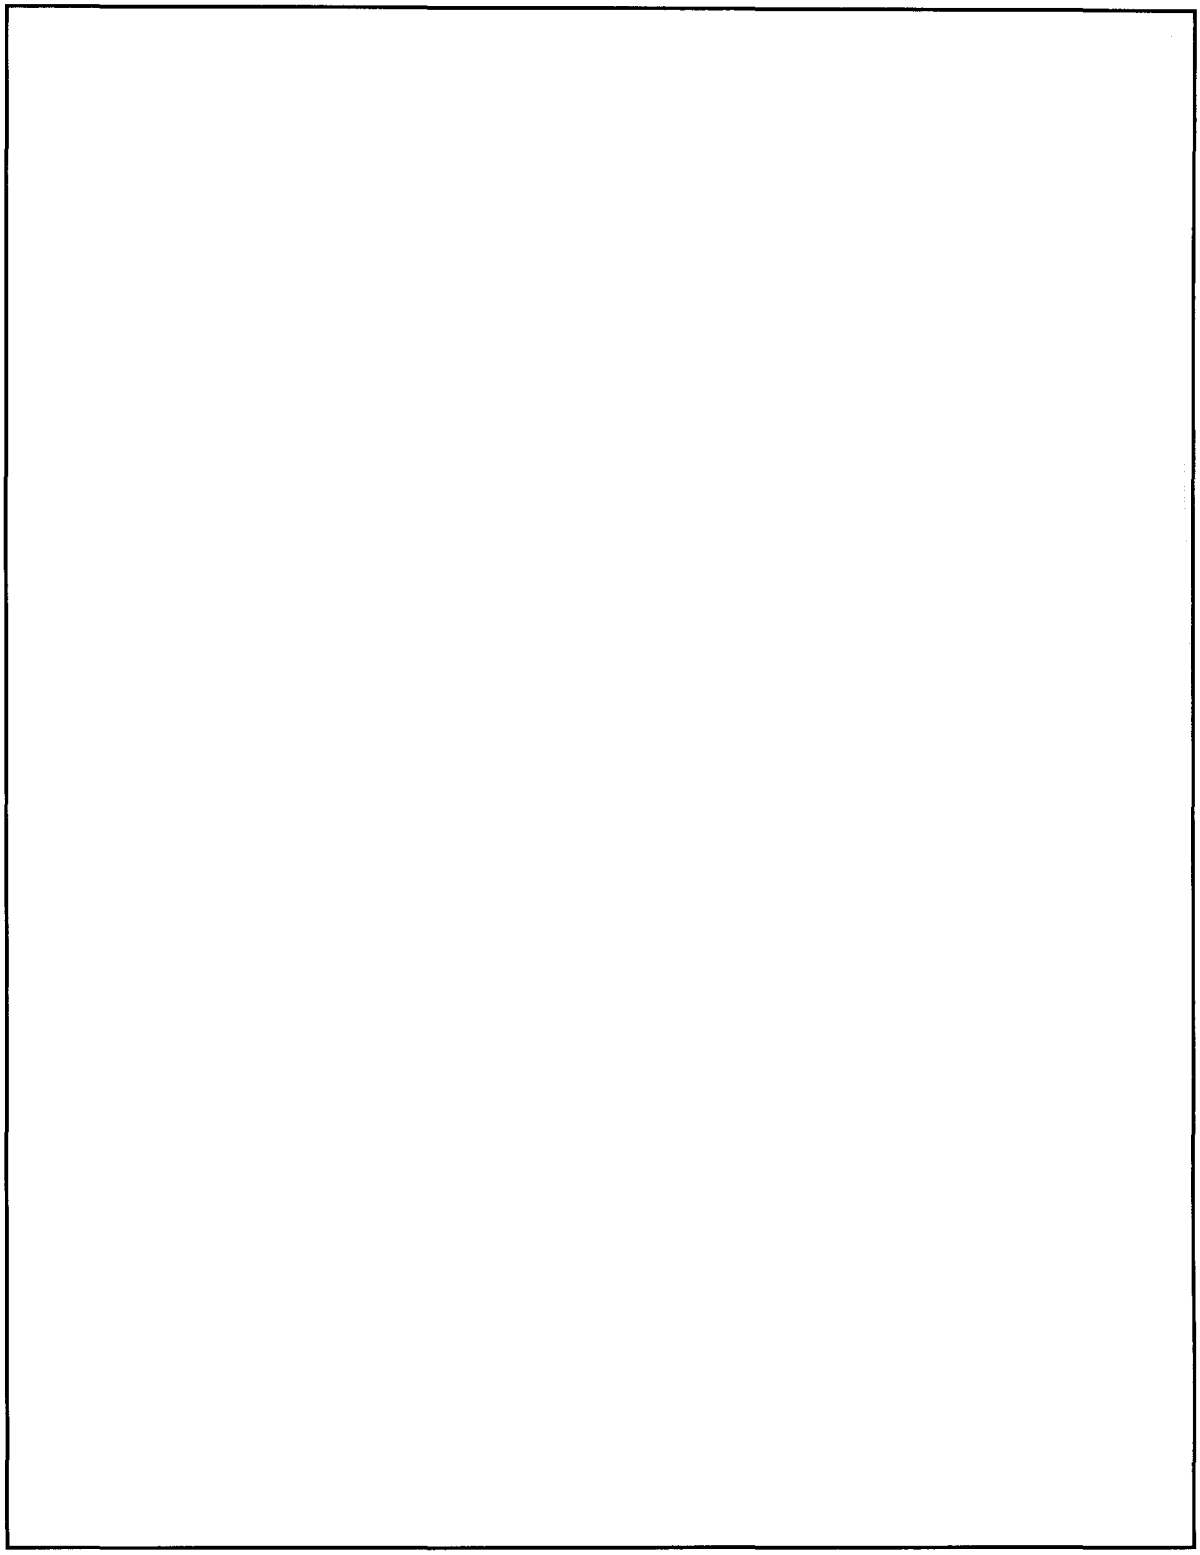
The military traffic is mixed in with other traffic having the same externals, except that the A5 position of the nonmilitary traffic exhibits no detectable bias. Obviously, the indicator characteristic is useful in differentiating between military and nonmilitary traffic.

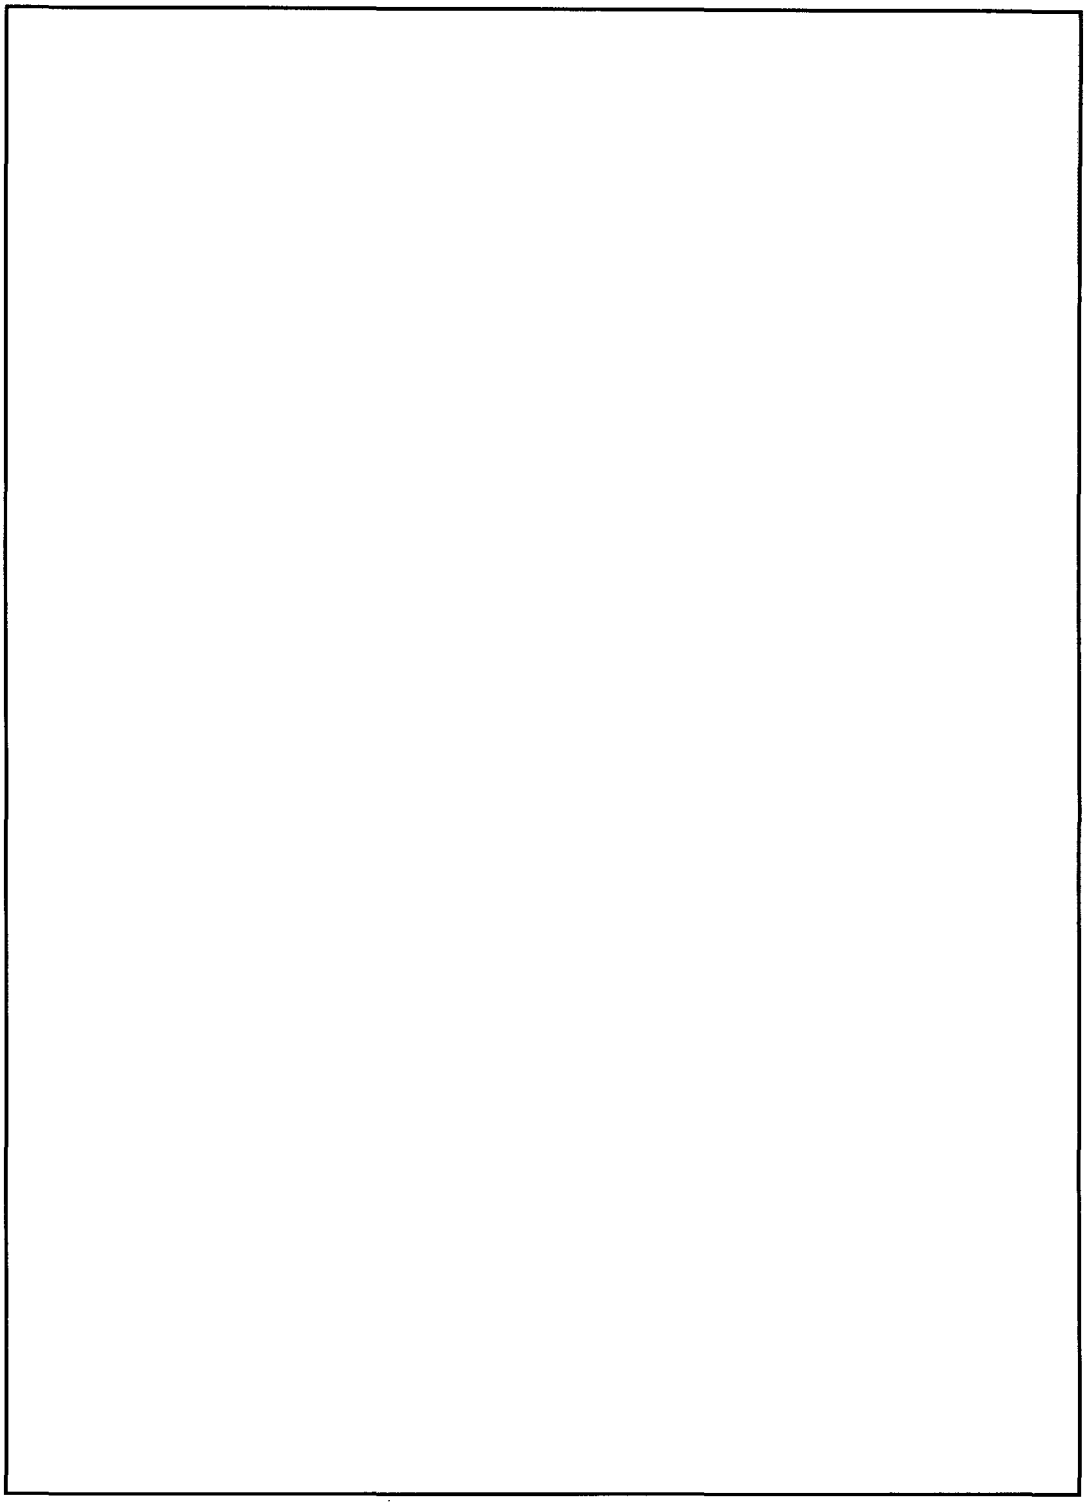
Suddenly, on the first of the month, the indicator disappears from the A5 position of the military traffic. *What happened to the indicator group*? Did it move to another position, or has an additive been applied to it?

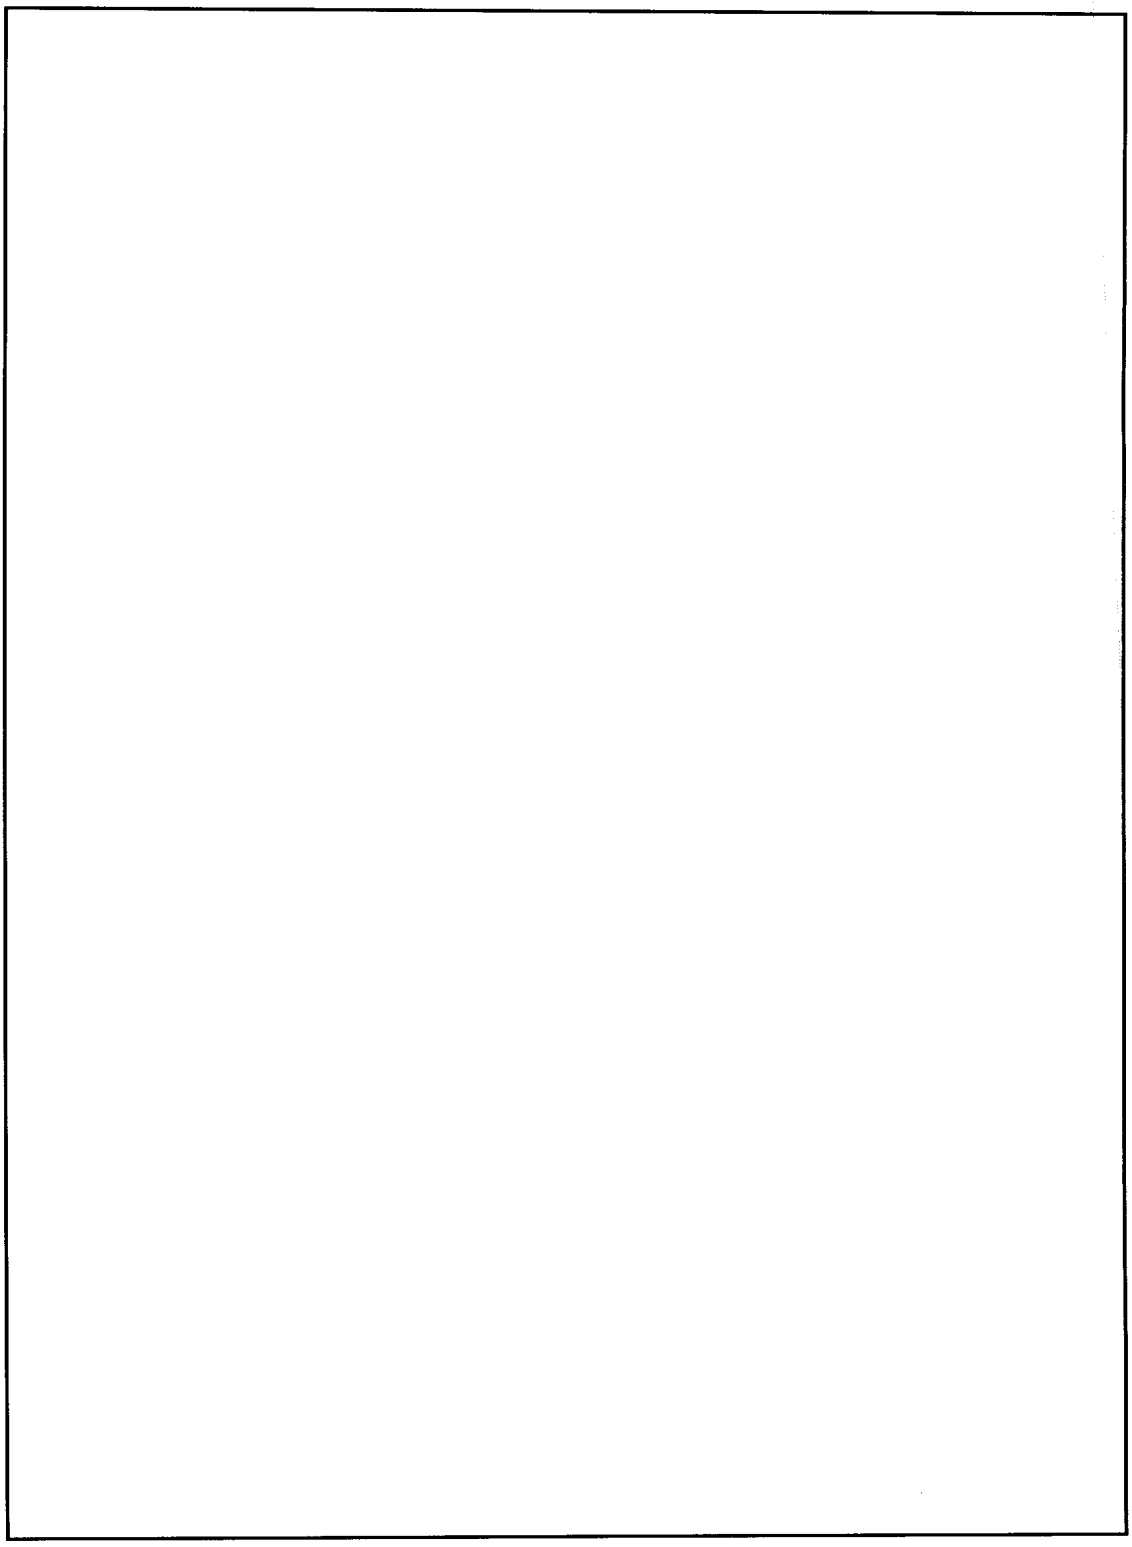
SOLUTION

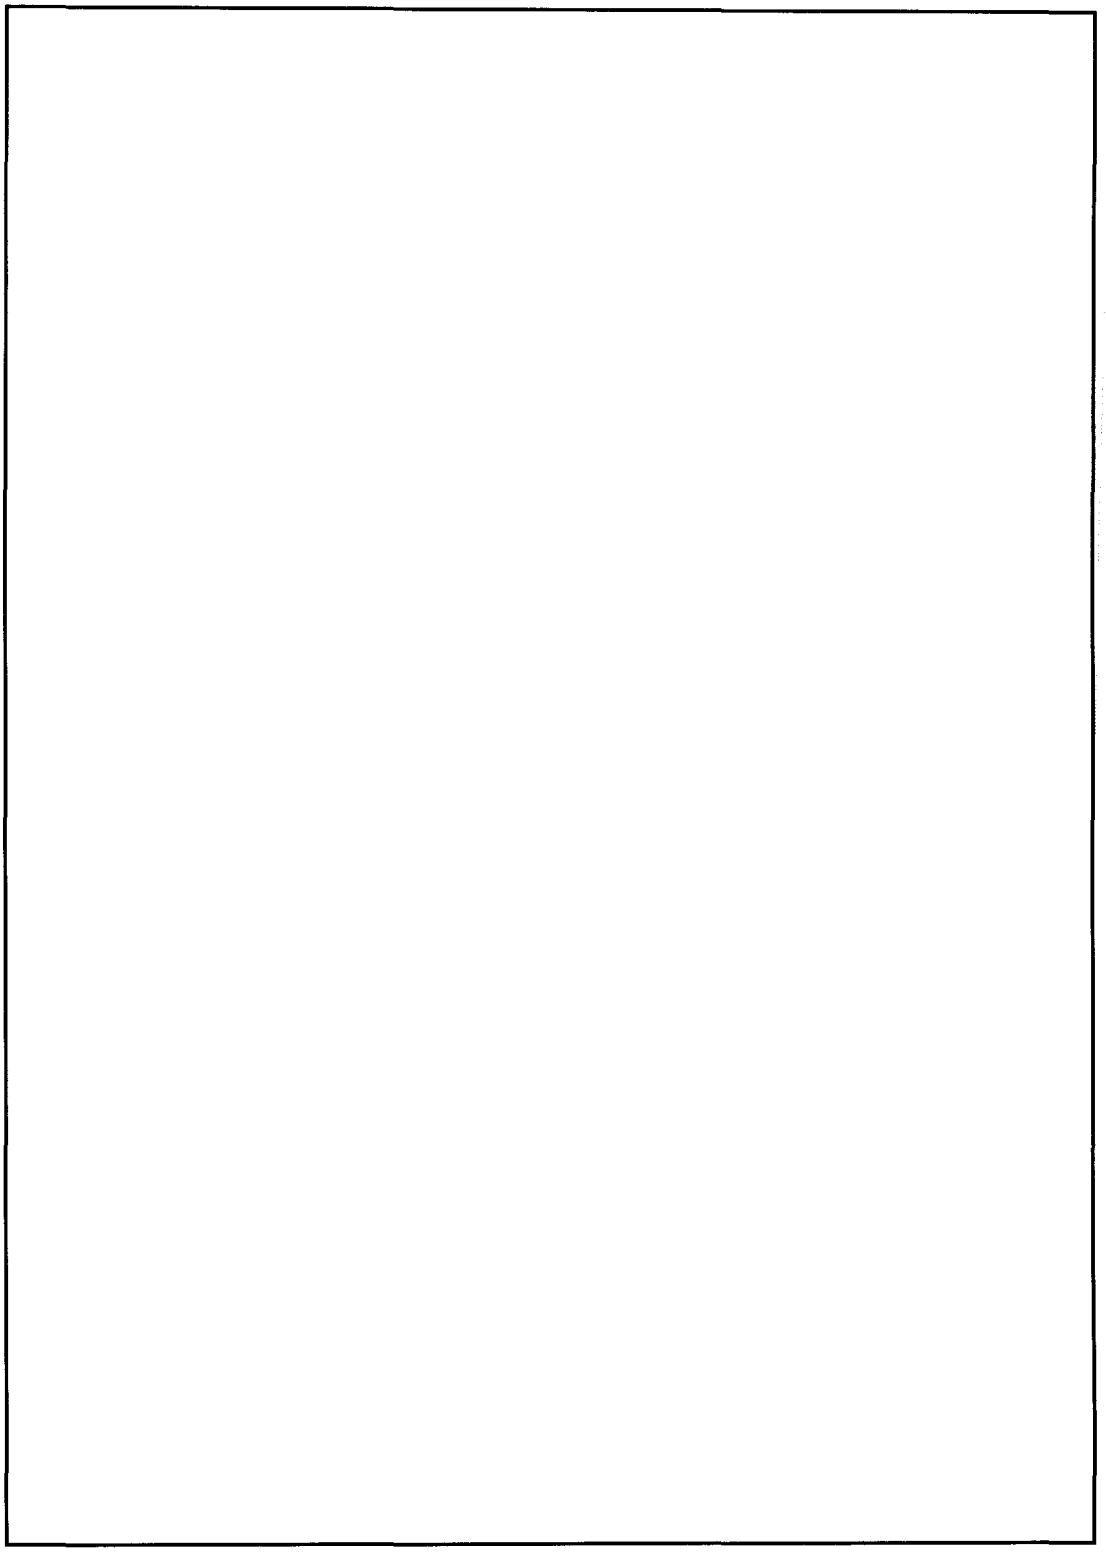
The analyst needs a method for diagnosing what has happened. To begin with, he decides to check positions A1 through A10, inclusive, to see if any of these positions exhibit any characteristics that would favor the hypothesis that the old-type indicator is present there. He has 200 messages to work with. Since he is not sure that they are all military, he doesn't know the distribution of the groups in each particular position of the messages. Some of the groups in a particular position may have causal sums while the rest do not. However, he feels sure that if the indicator is not present, the groups are distributed as if the digits of each group were equally likely. Therefore, he sets out to find or calculate the distribution of the sums of five-digit groups when each digit is equally likely.

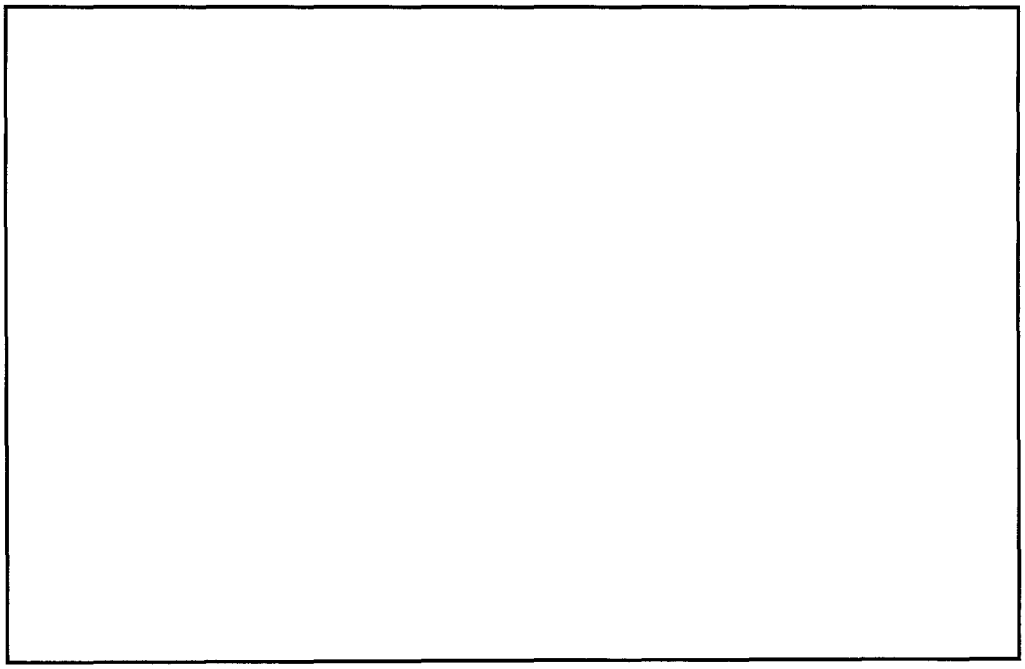












Applications of Set Theory to Traffic Analysis

[redacted] P.L. 86-36

The purpose of this presentation is to show an approach to traffic analysis that uses set theory concepts and terminology. For this purpose, we have created a hypothetical problem designed to represent some aspects that could be reflected in a real problem. Although the following example is limited to callsign analysis, a similar approach could be used to analyze frequencies, practice traffic systems, or other data.

The hypothetical problem involves the country of Transylvania, which is divided into seven military regions labeled A through G. The callsigns used in Transylvanian communications are derived from a fifteen-page callsign system. Each page is a ten-by-ten matrix of 100 callsigns with each callsign appearing only once in the system. Further, let us assume that each military region can use callsigns from three different pages as follows:

AREA	CALLSIGN PAGES
A	01, 08, 04
B	02, 09, 05
C	03, 10, 06
D	04, 11, 07
E	05, 12, 03
F	06, 13, 01
G	07, 14, 02

A "set" is defined as a collection of well-defined objects; given any object, one can determine whether that object belongs or does not belong to a given set, i.e., whether it is an element of the set. To illustrate a callsign set, we use a Venn diagram as shown in figure 1.

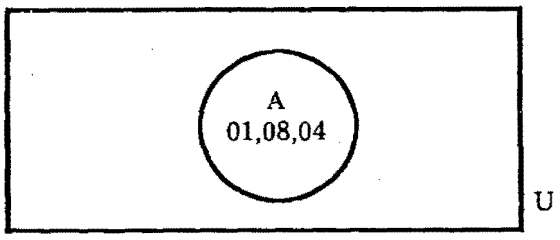


Fig. 1

The set "U," represented by the above rectangle, is the universal or complete set of callsigns in the Transylvanian system. In general, the universal set refers to the entire collection of objects being considered. The circle labeled "A" represents the set of callsigns from pages 01, 08 and 04, which are available for use on the internal communications of Military Region "A." Thus, all callsigns on pages 01, 04 and 08 are elements of the set of callsigns used by region A.

The union of two sets can be illustrated by the shaded area in figure 2.

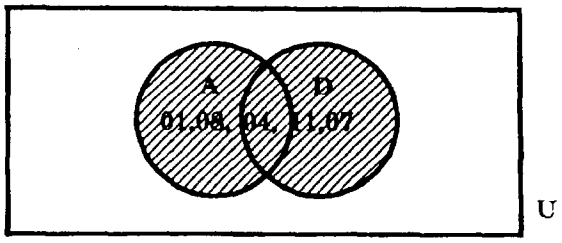

Fig. 2

We define the "union" of two sets A and D, denoted A∪D, as the collection of all elements that belong to either the set A or the set D, or both. The above example represents the union of the callsign sets used by Transylvanian Regions A and D, i.e., all callsigns in pages 01, 04, 07, 08, and 11.

The "intersection" of two sets can be illustrated by the shaded area of the Venn diagram in figure 3.

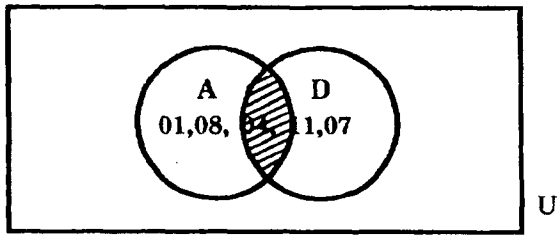

Fig. 3

We define the "intersection" of two sets A and D, denoted A∩D, as the set of all elements that belong both to A and to D. In this example, only callsigns from page 04 are available for use by both Military Regions A and D. Therefore, A-D is the set of callsigns on page 04. Suppose an unidentified radio group represents communications for elements of either Region A or D. Three possibilities exist:

- If at least some of the callsigns used are taken from either pages 01 and/or 08, then the radio group is in Region A.
- If at least some of the callsigns used are taken from either pages 11 and/or 07, then the radio group is in Region D.
- If all the callsigns used are extracted from page 04, then the radio group may be located in either Region A or D.

Two sets are said to be "disjoint" if they have no elements in common. For example, in figure 4 it can be seen that the communications of Region A will not use callsigns available to Region B and vice versa. This callsign set relationship gives a firm basis for the differentiation between communications of these regions.

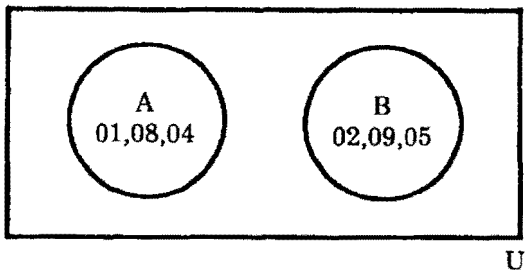

Fig. 4

In order to gain more insight and understanding of the communications of an entire country, it may be helpful to represent the technical data under consideration as sets in a Venn diagram. For our example, see the Venn diagram in figure 5.

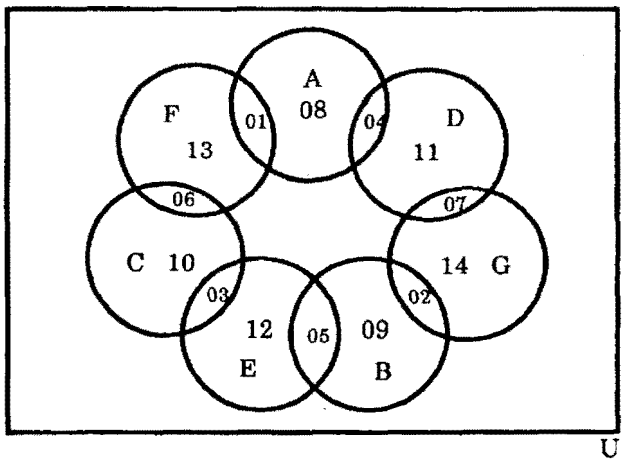

Fig. 5

AREA	CALLSIGN PAGES
A	01,08,04
B	02,09,05
C	03,10,06
D	04,11,07
E	05,12,03
F	06,13,01
G	07,14,02

From this Venn diagram, we can see that callsigns from pages 08 through 14 are unique to areas A through G, respectively. Consequently, these callsign pages can be used as a basis for identification of the area of communications. Since each of the callsign pages 01 through 07 is used by two different military regions, use of callsigns from these pages would reduce the problems of identification to one of two military regions. Further, callsign duplication, as shown in the above Venn diagram, may exist because of the

geographical separation of a military region by a natural barrier such as a mountain range, sea, or another country.

In conclusion, the analysis of technical data using set concepts is a systematic approach that may result in more understanding of the communications under study.

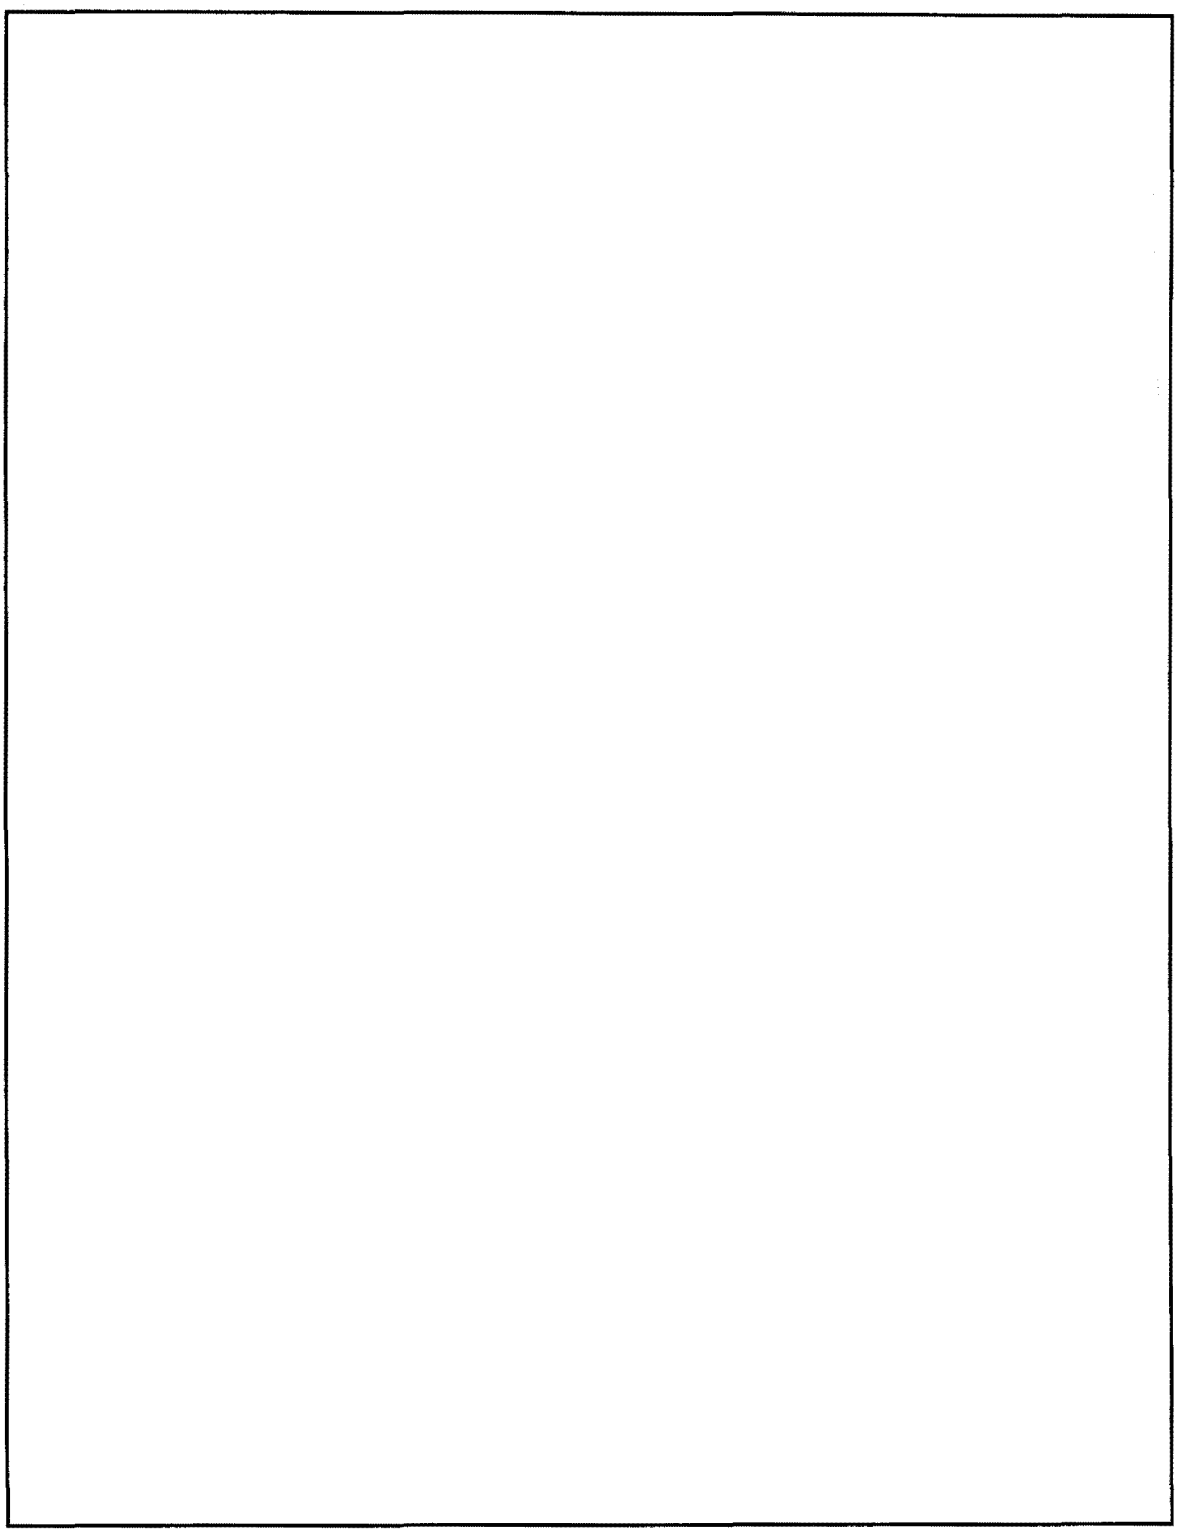
TA, CA, LOGIC, MATH: Where Do They Intersect?

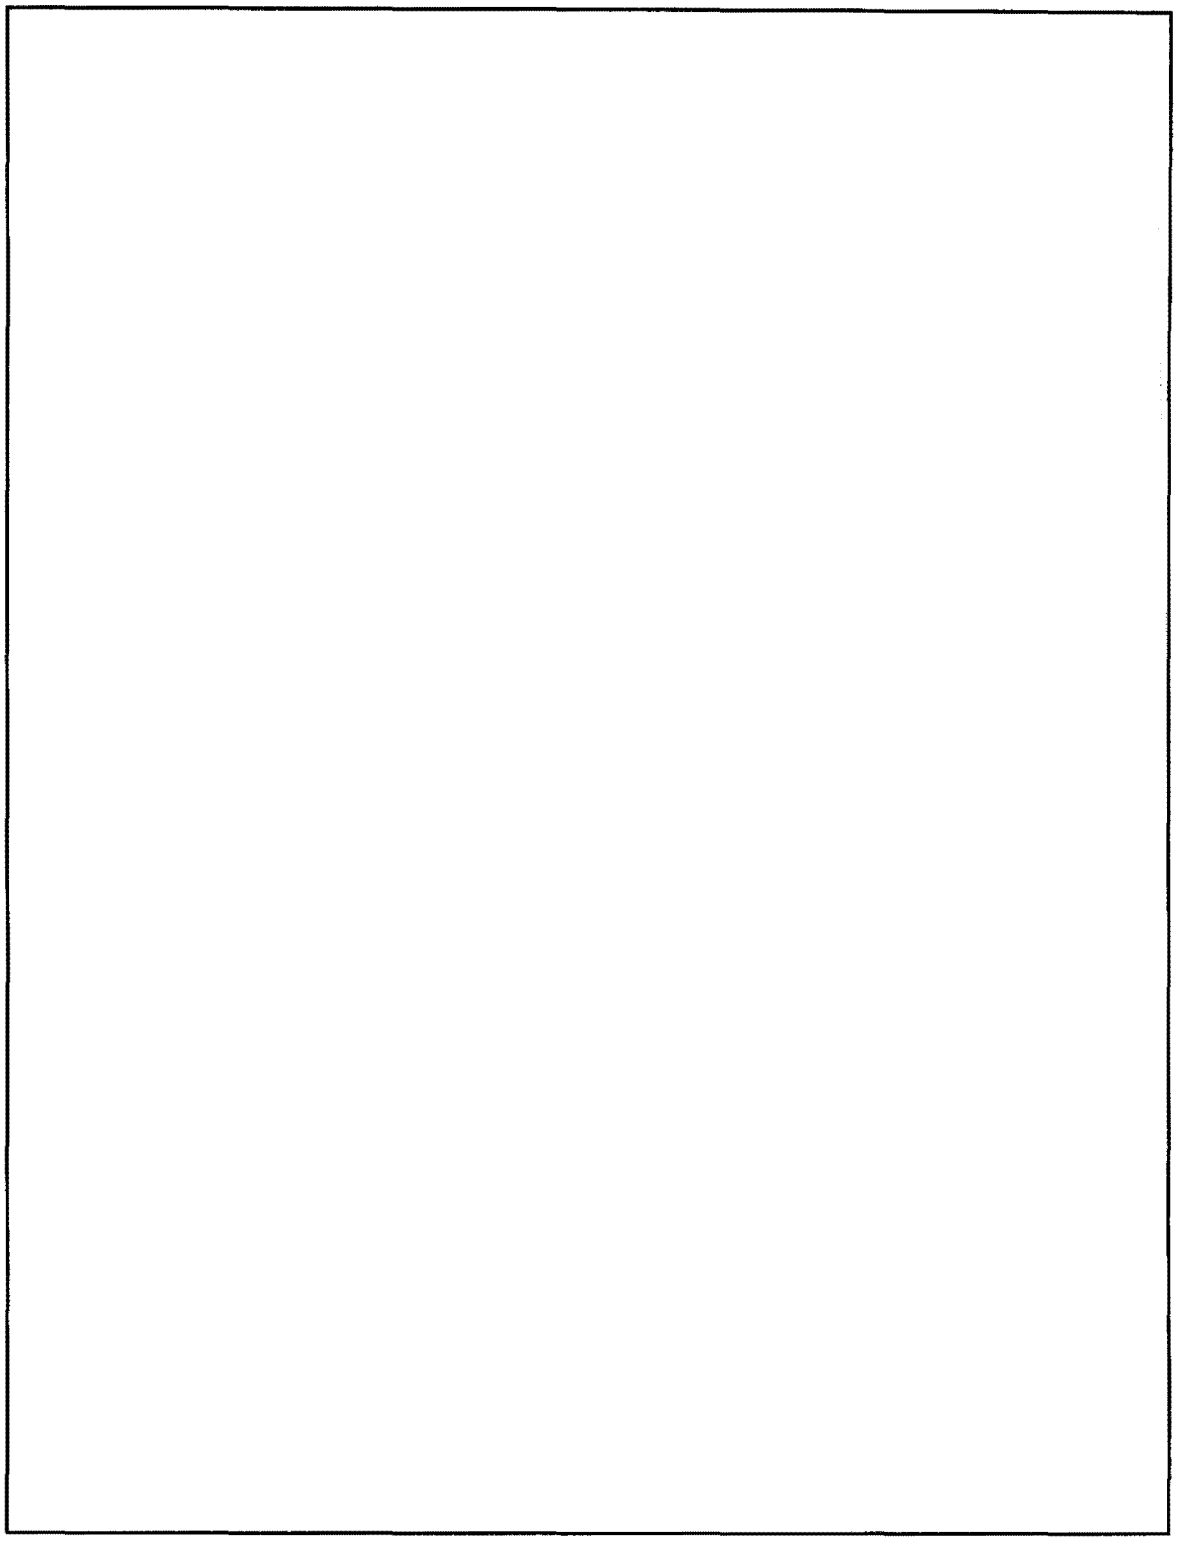
P.L. 86-36

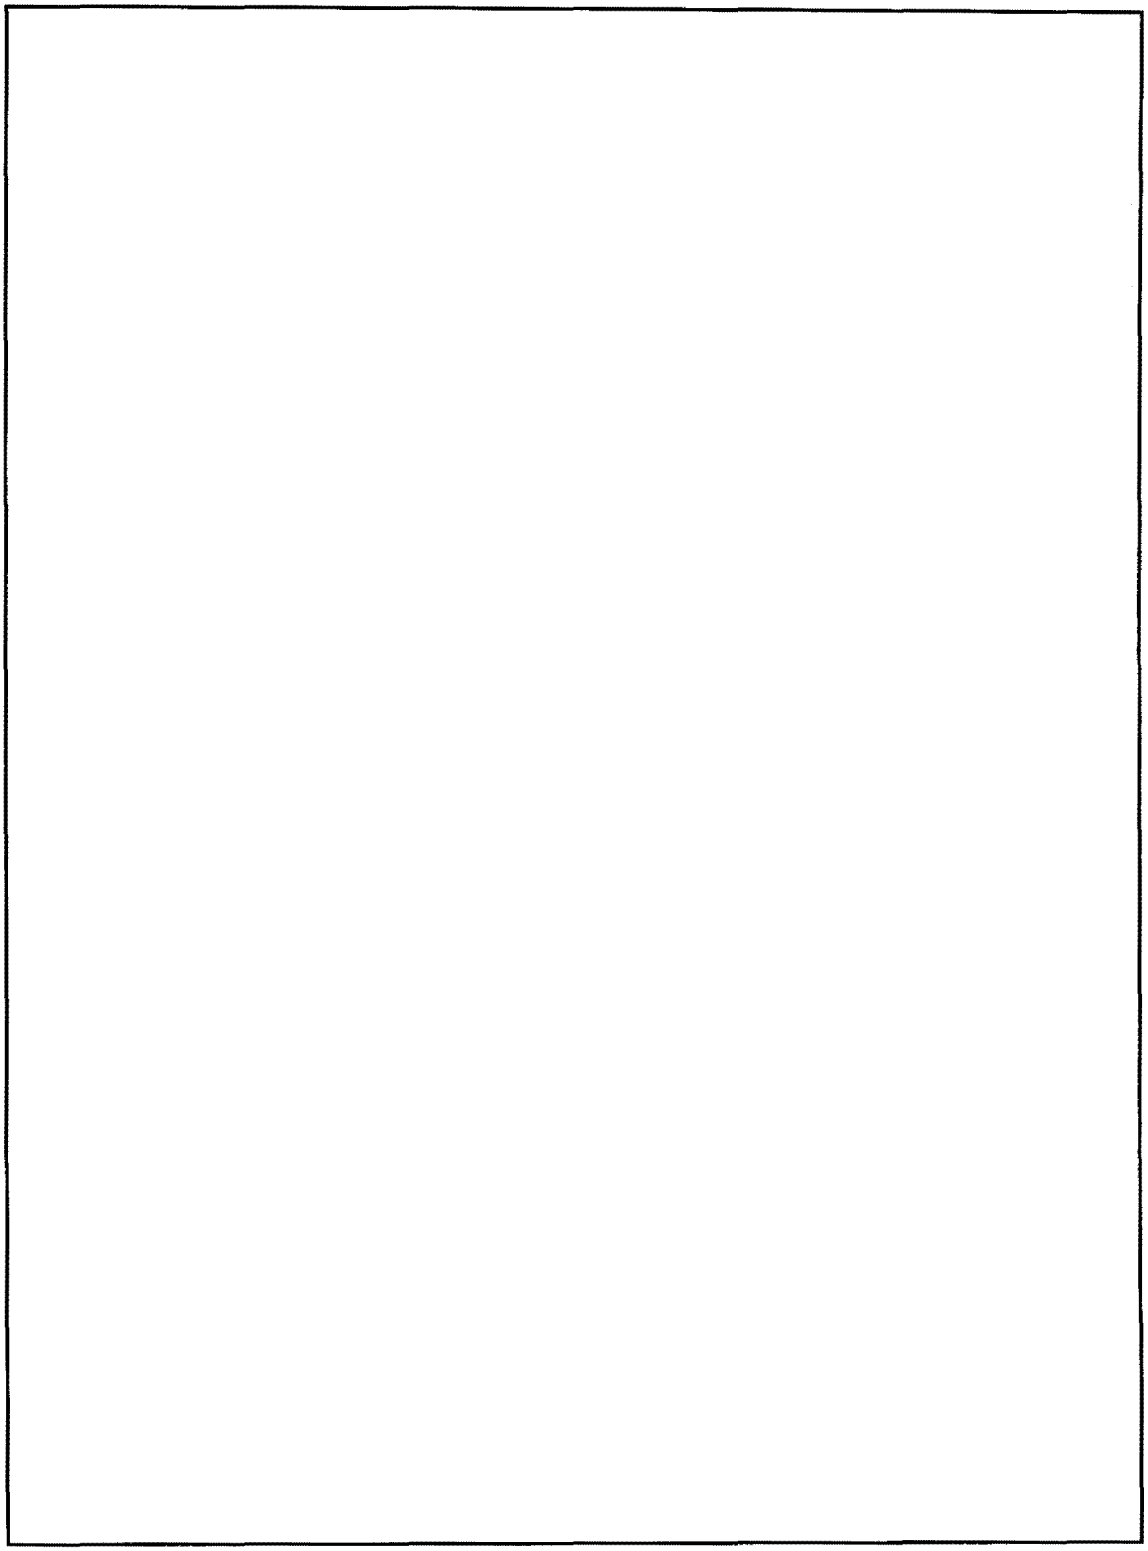
[redacted]

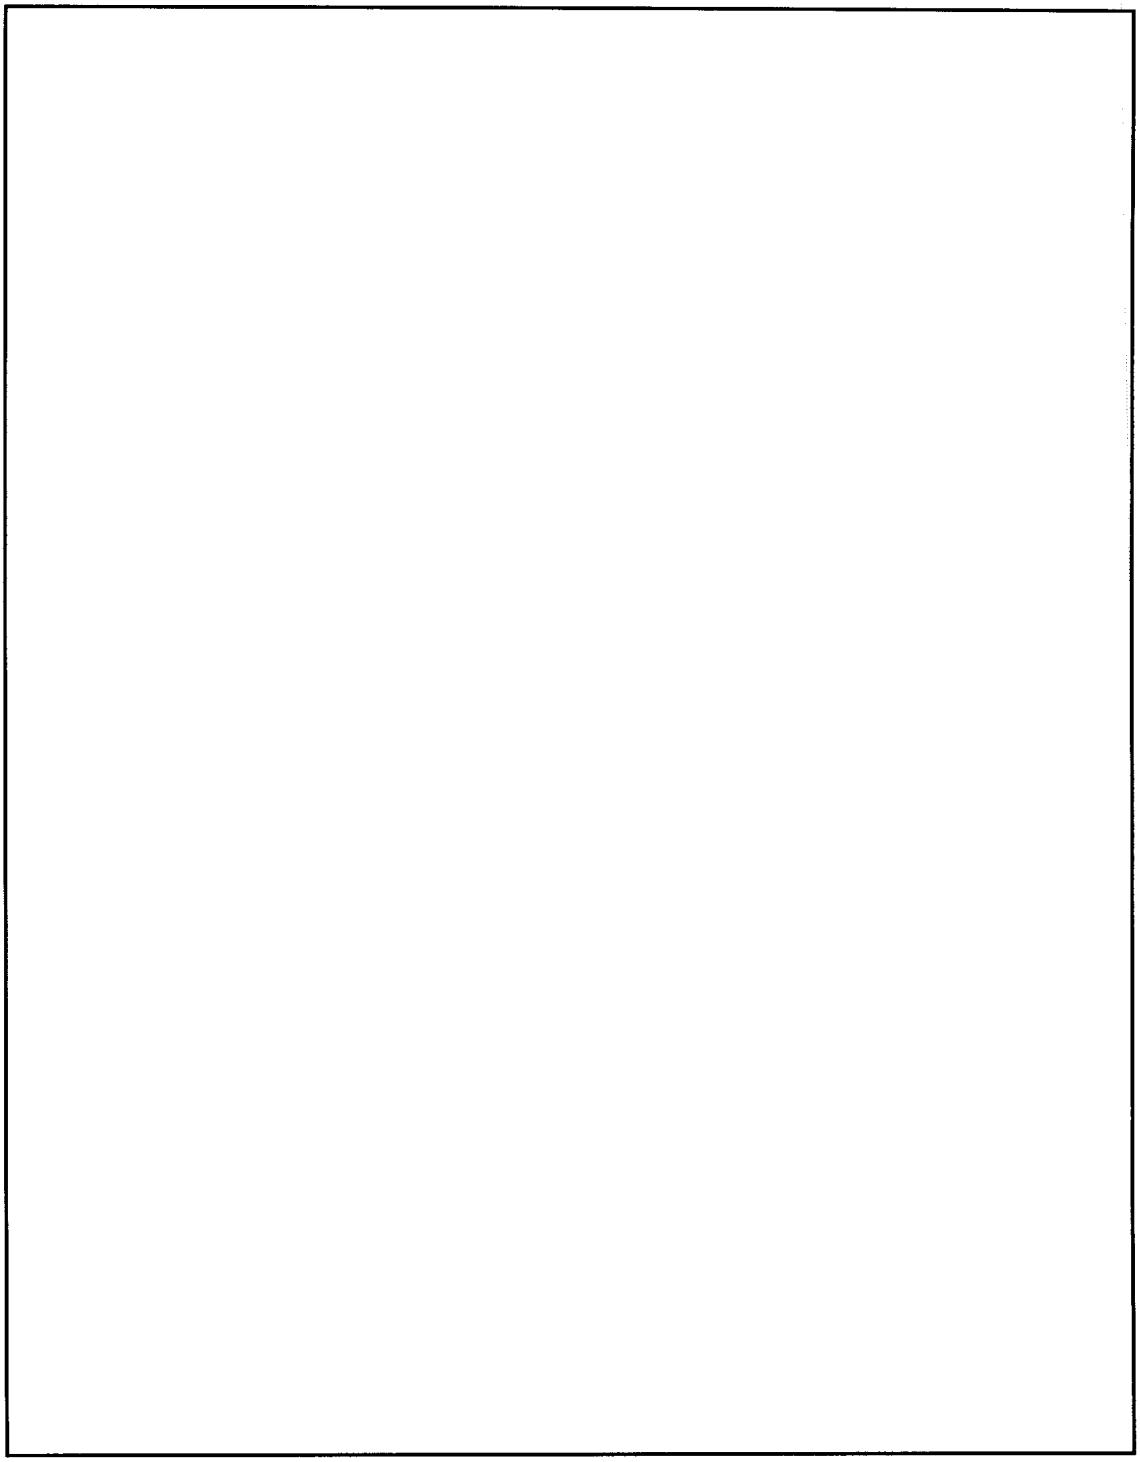
[redacted]

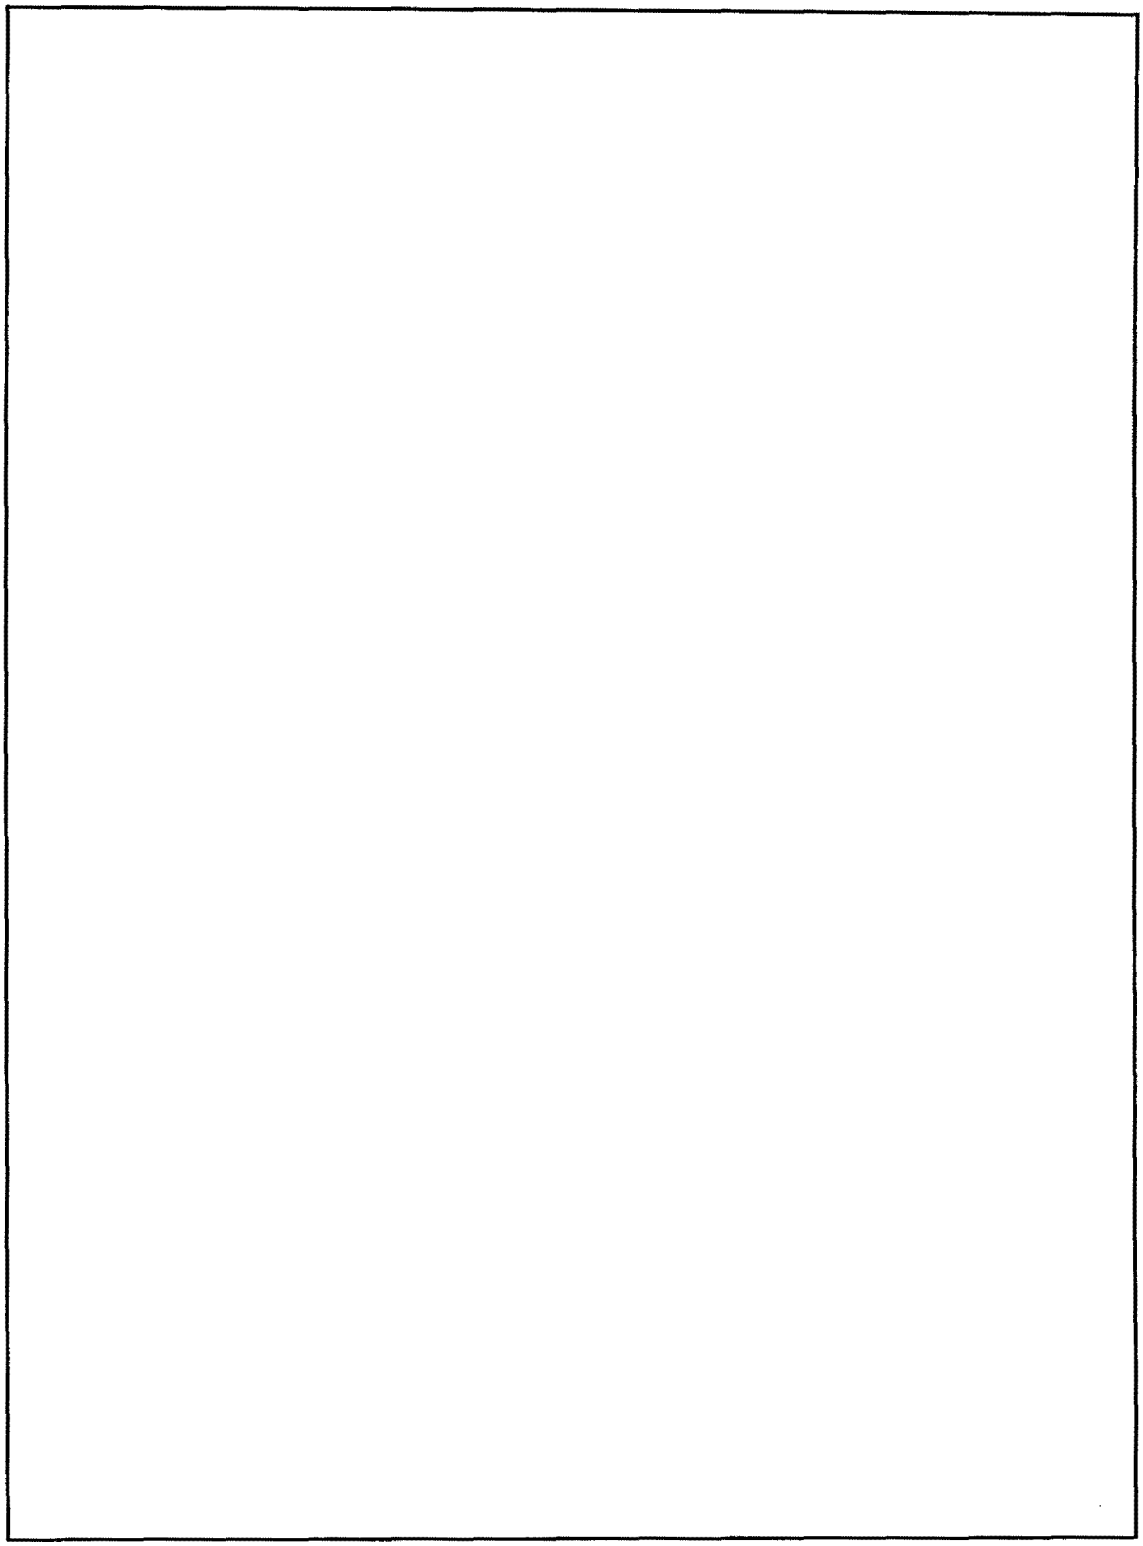
P.L. 86-36
EO 1.4(c)

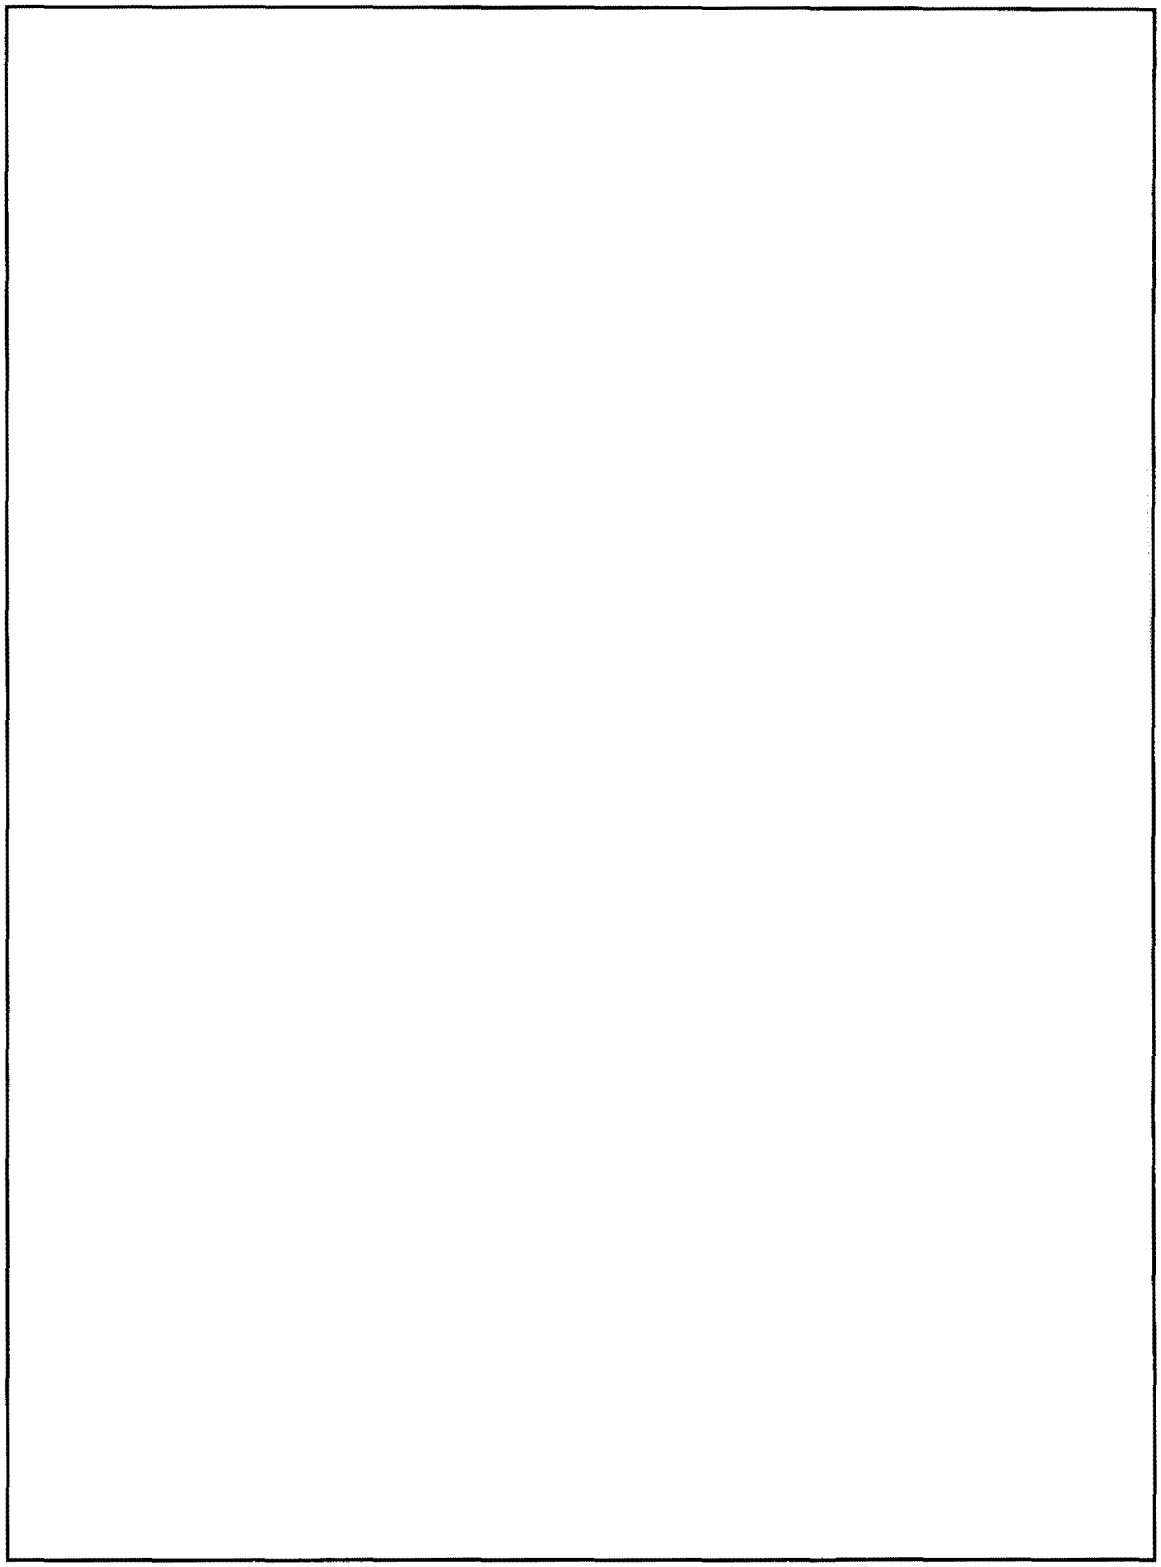


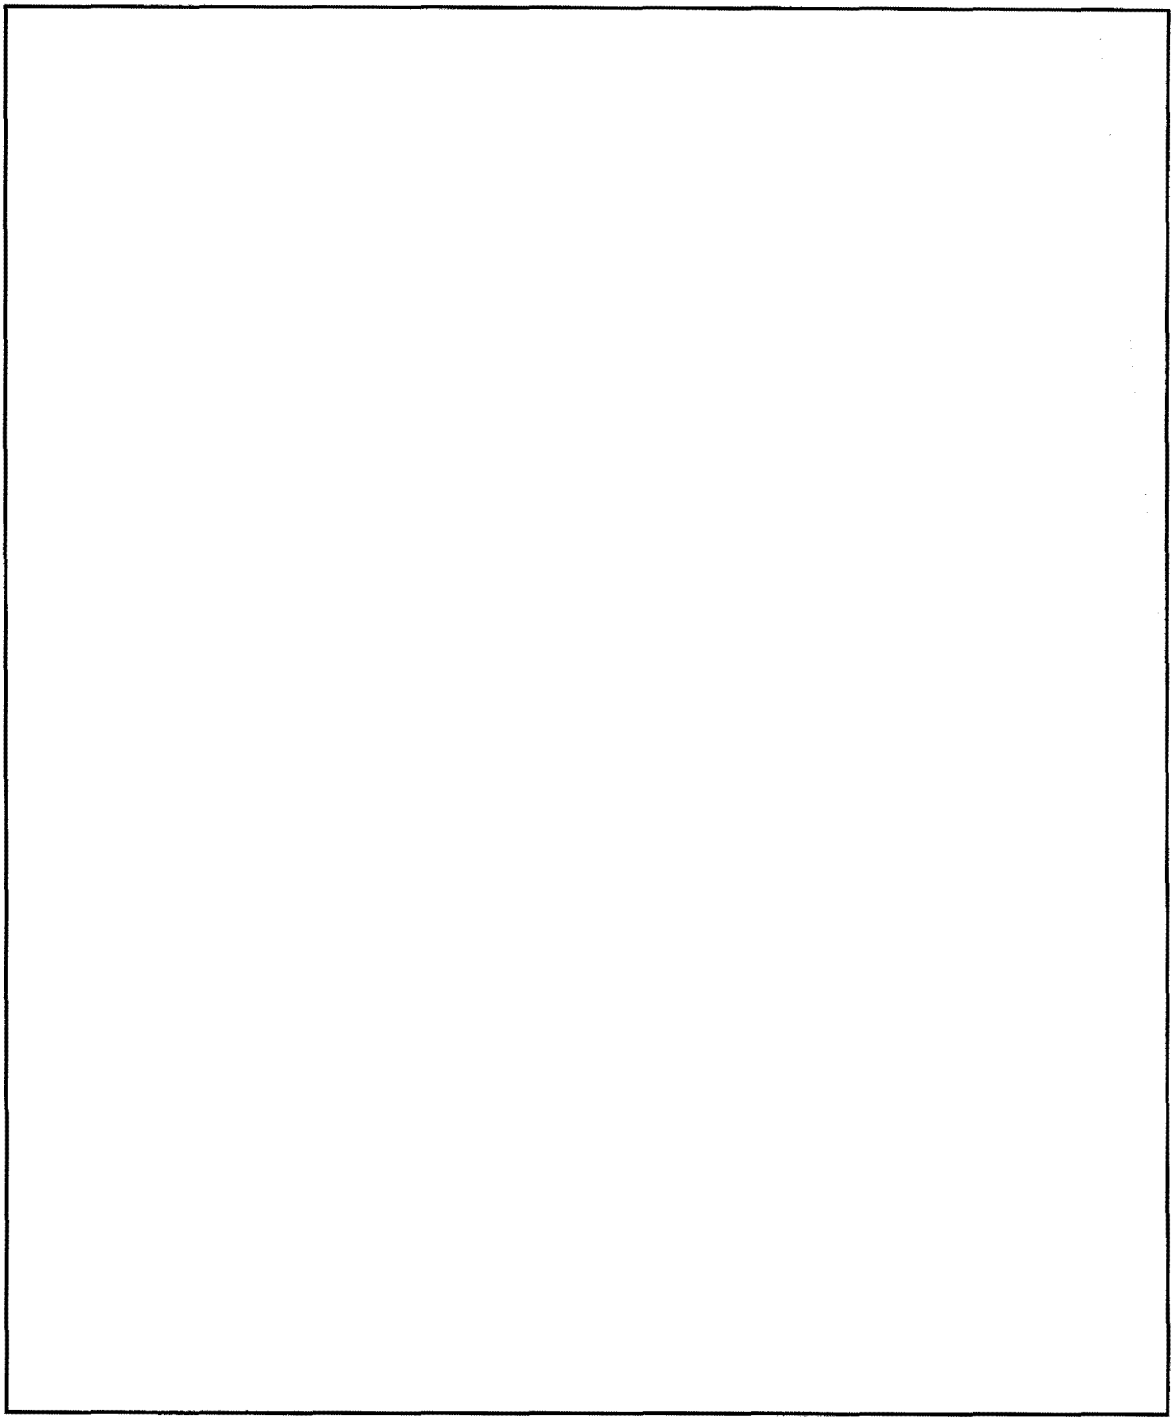


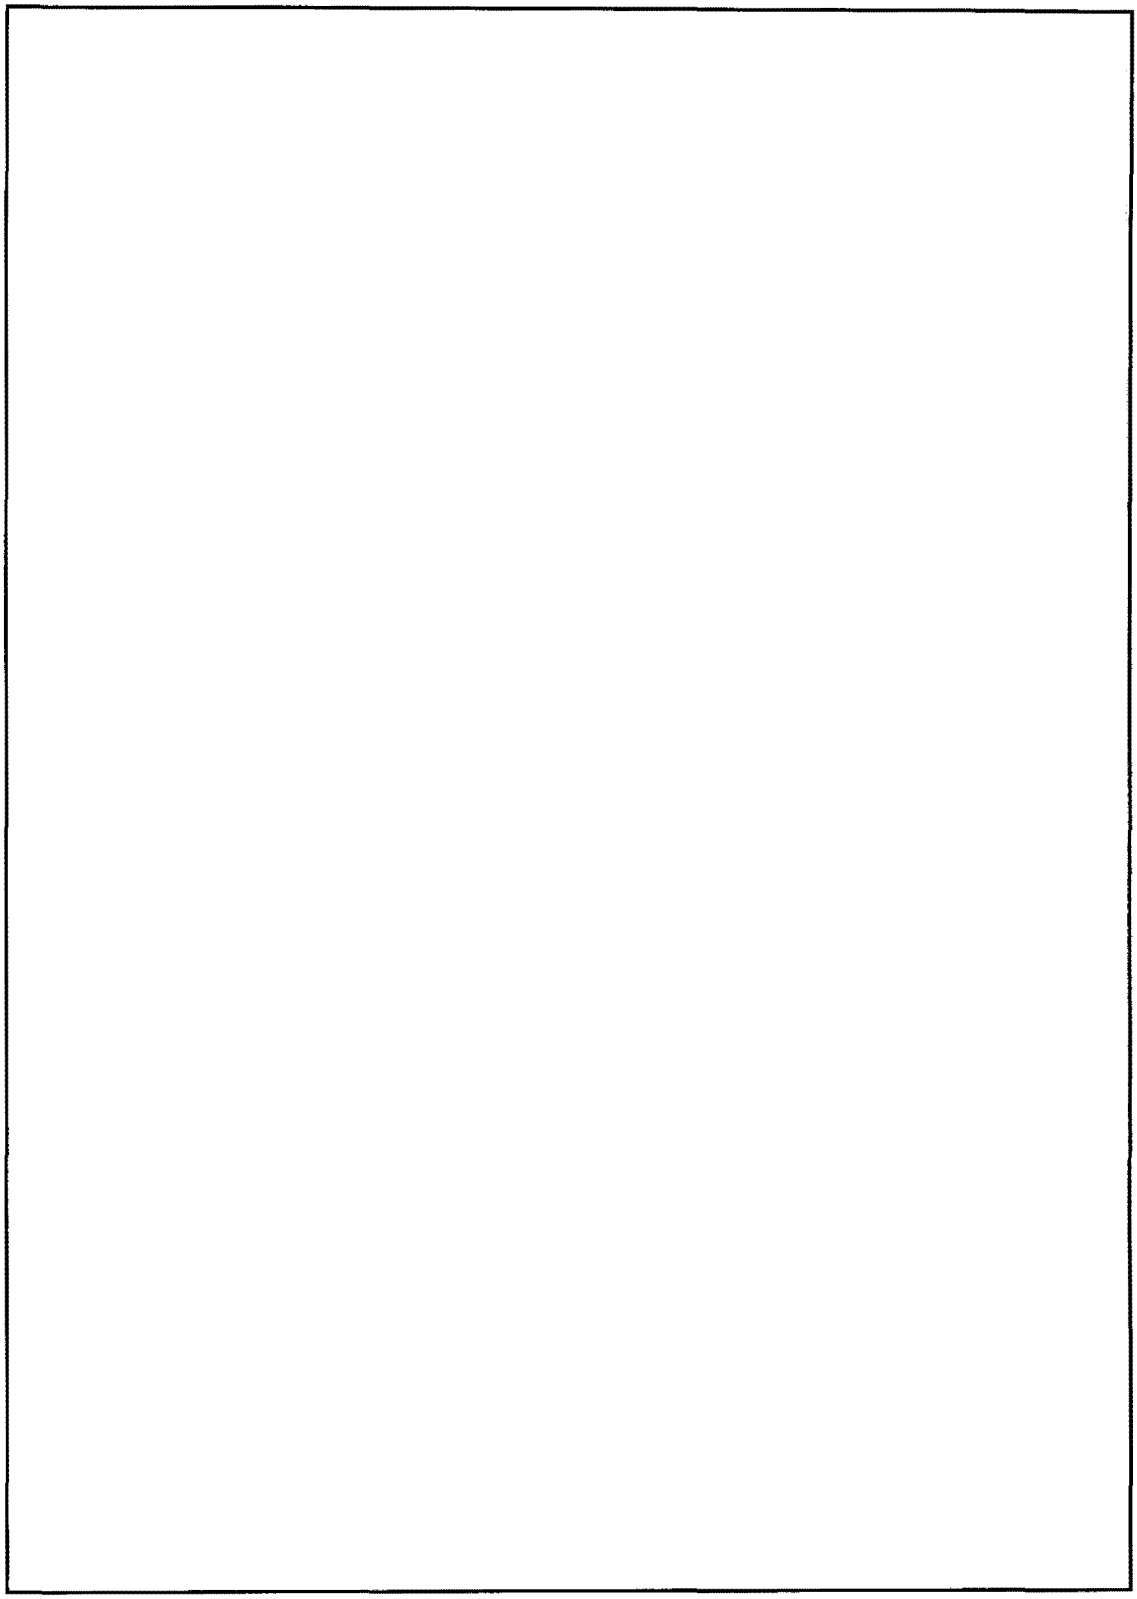


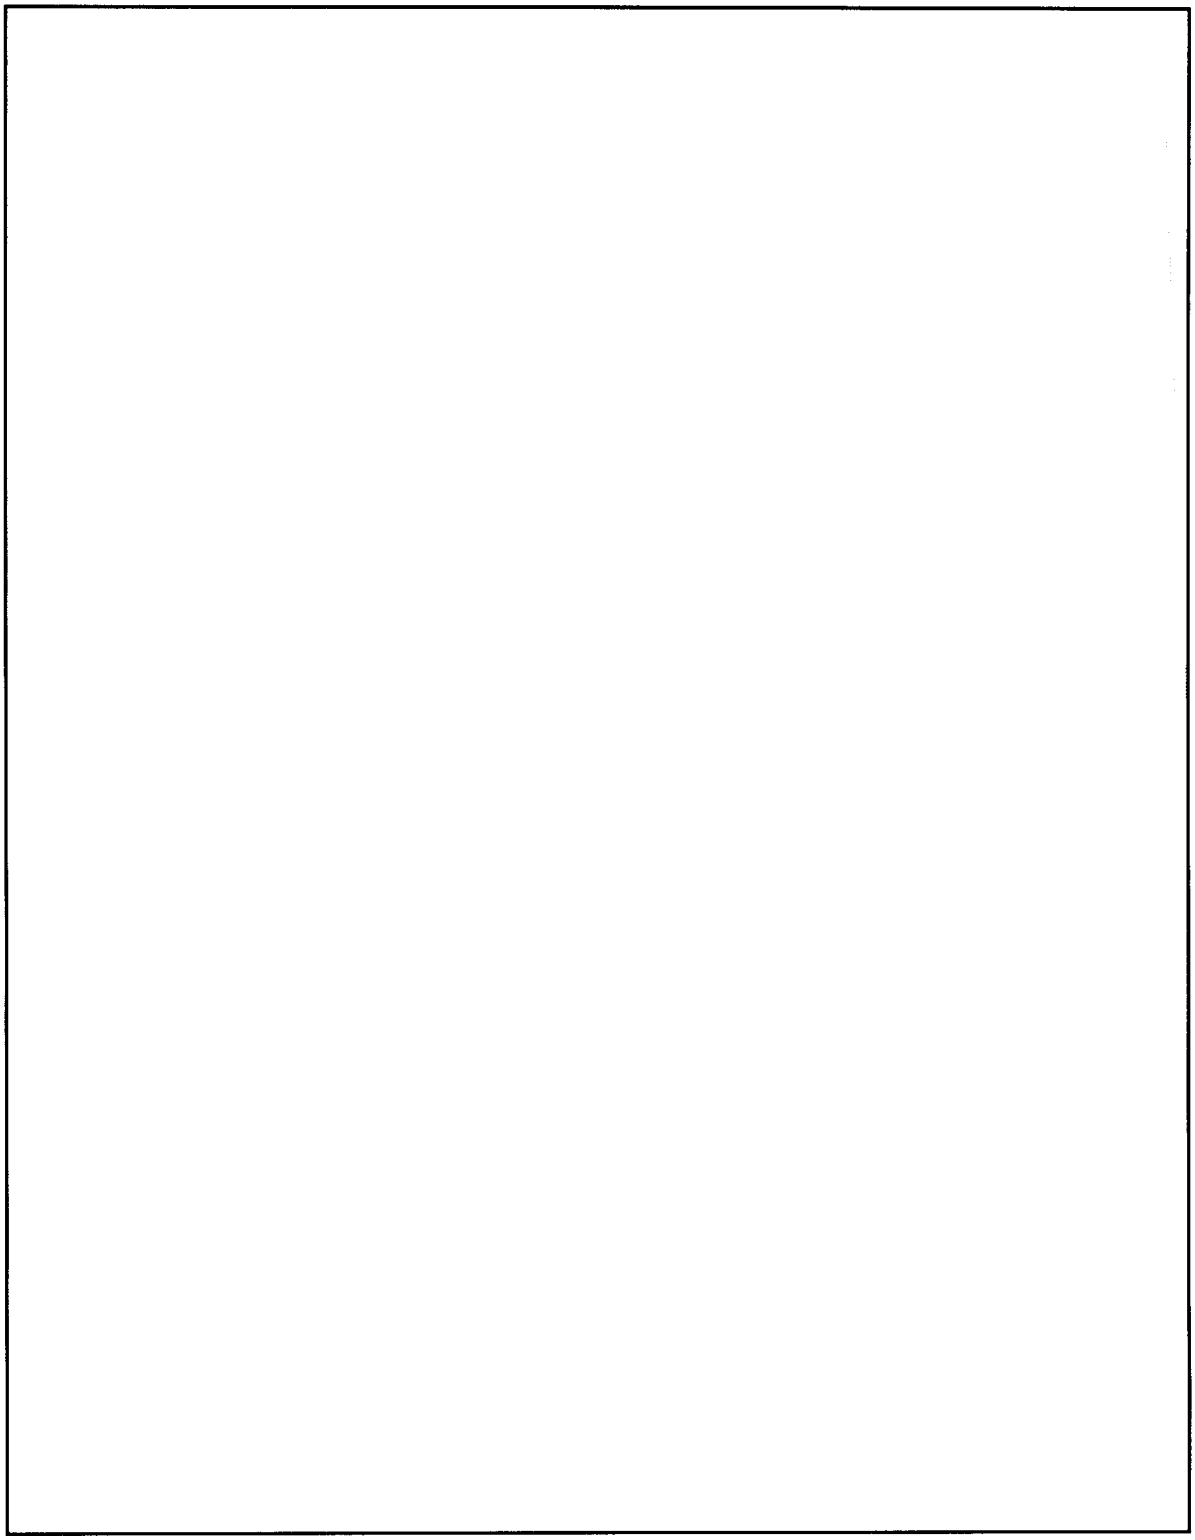


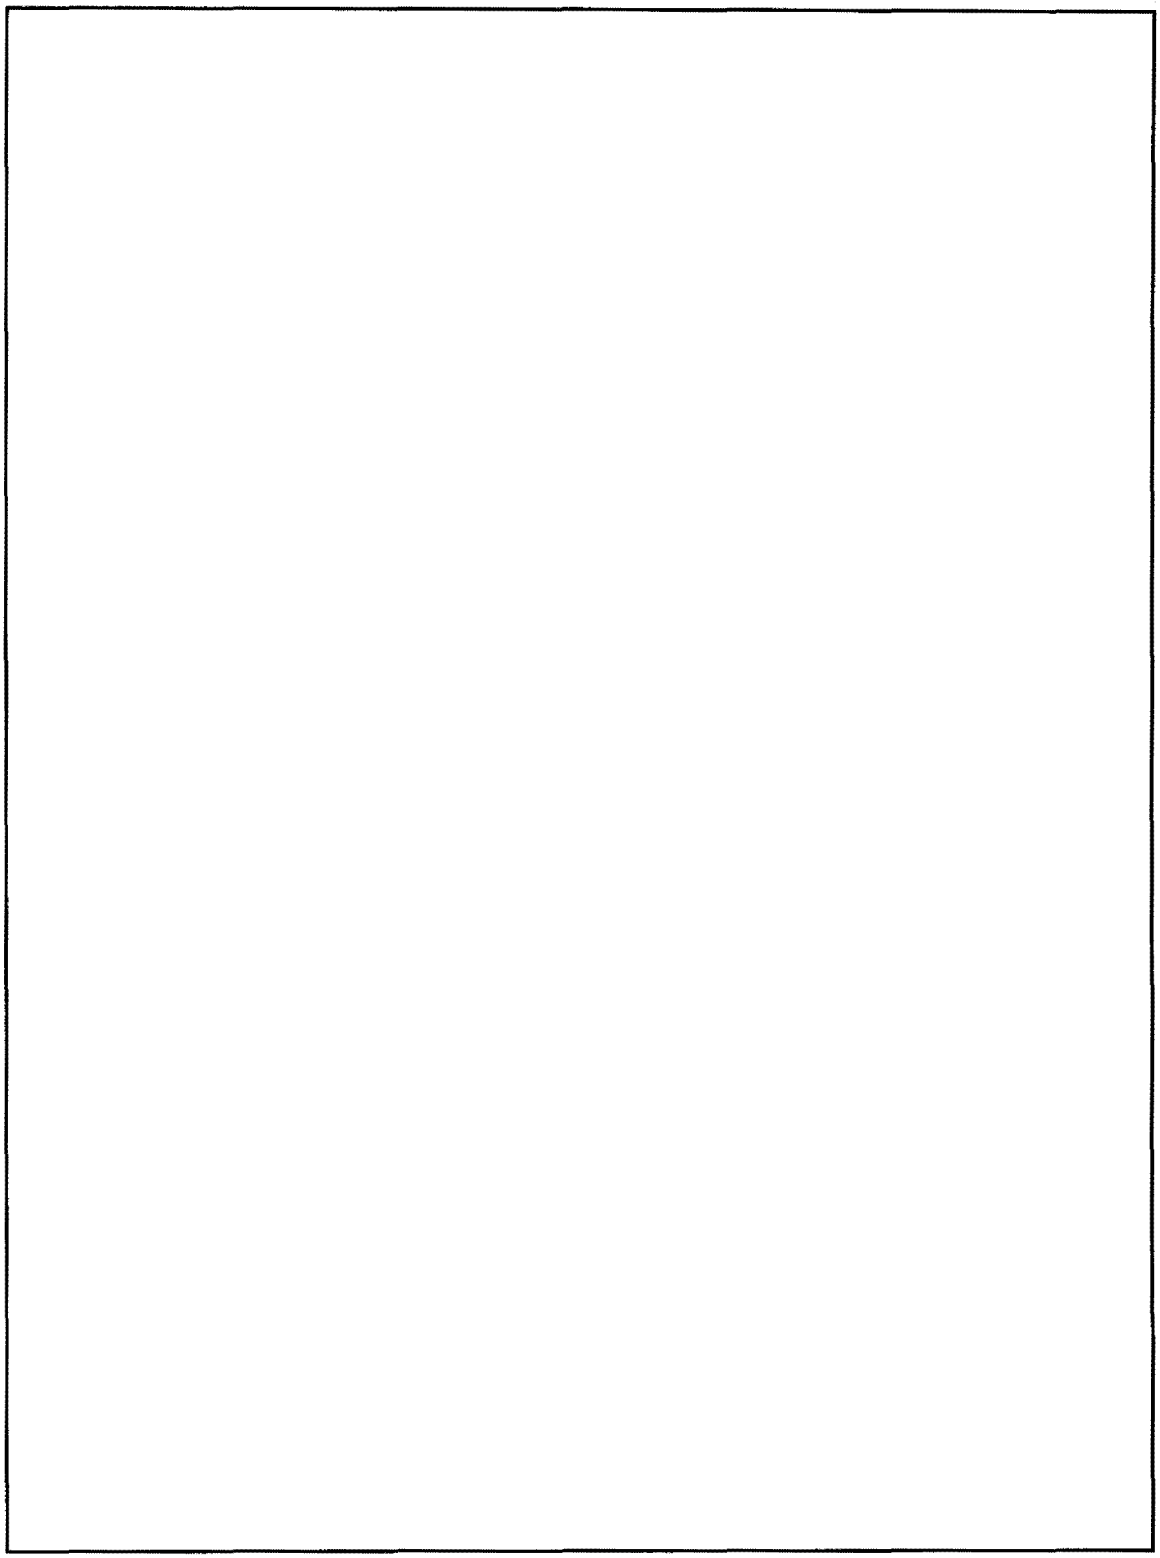


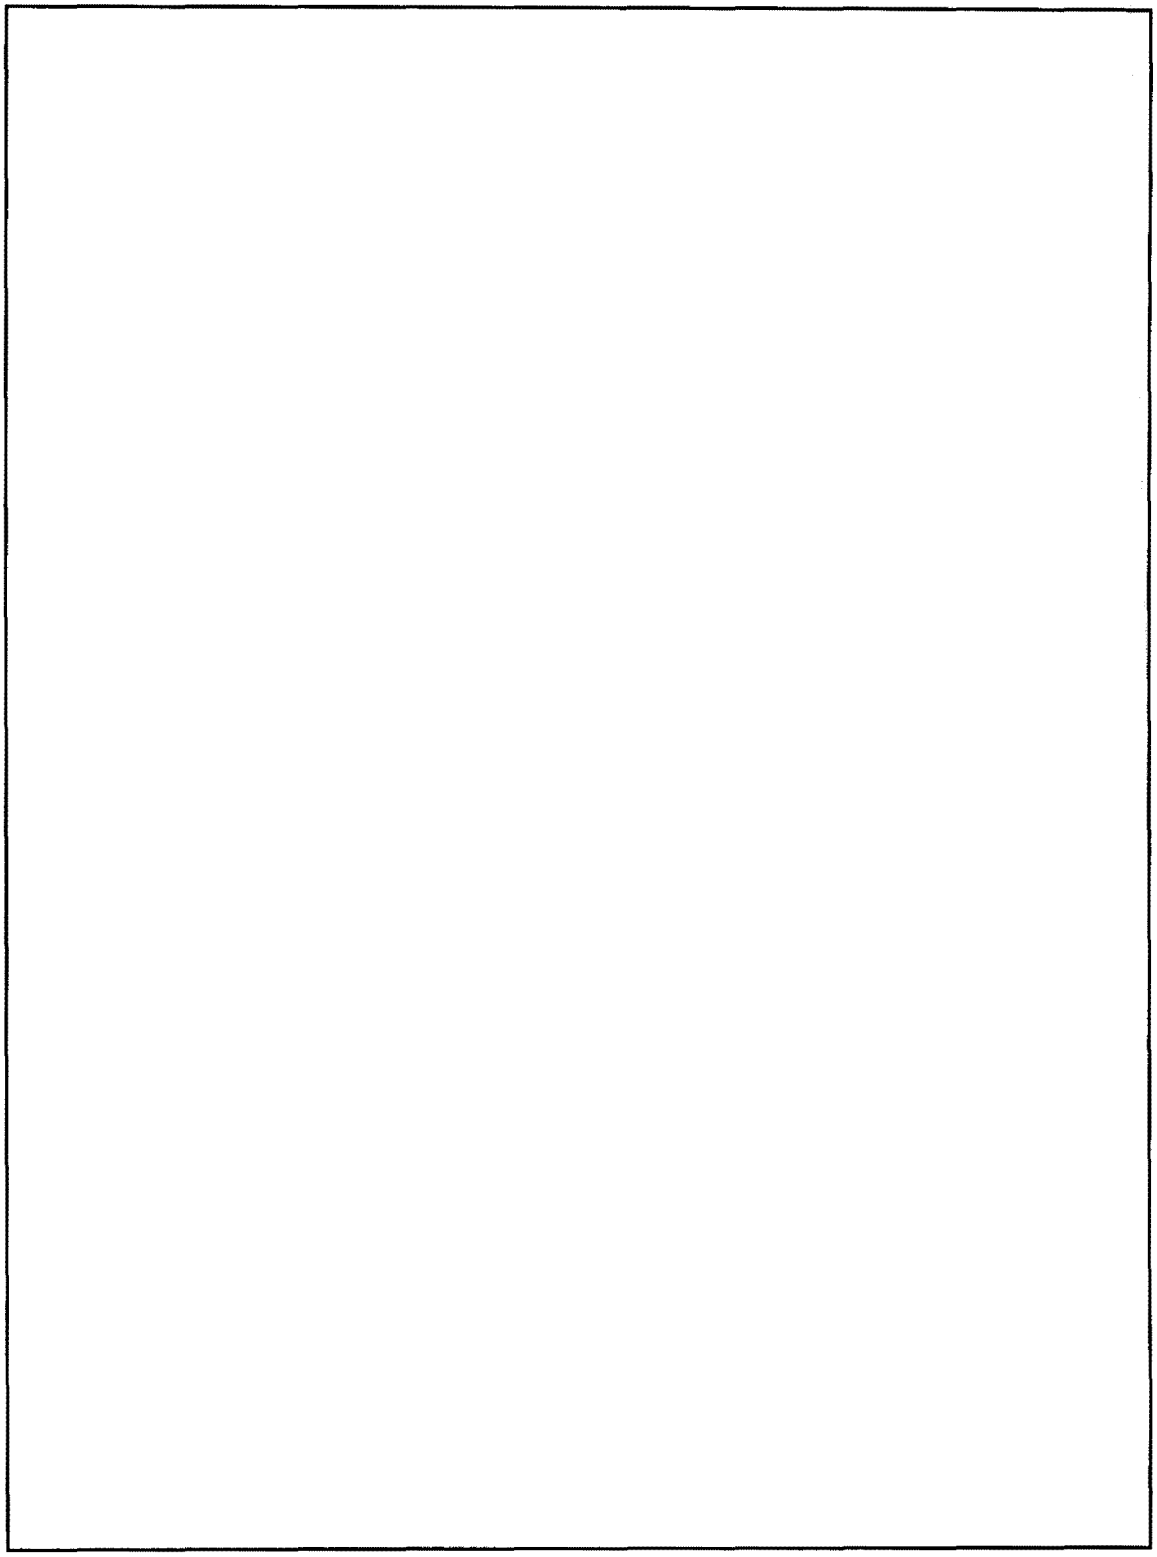


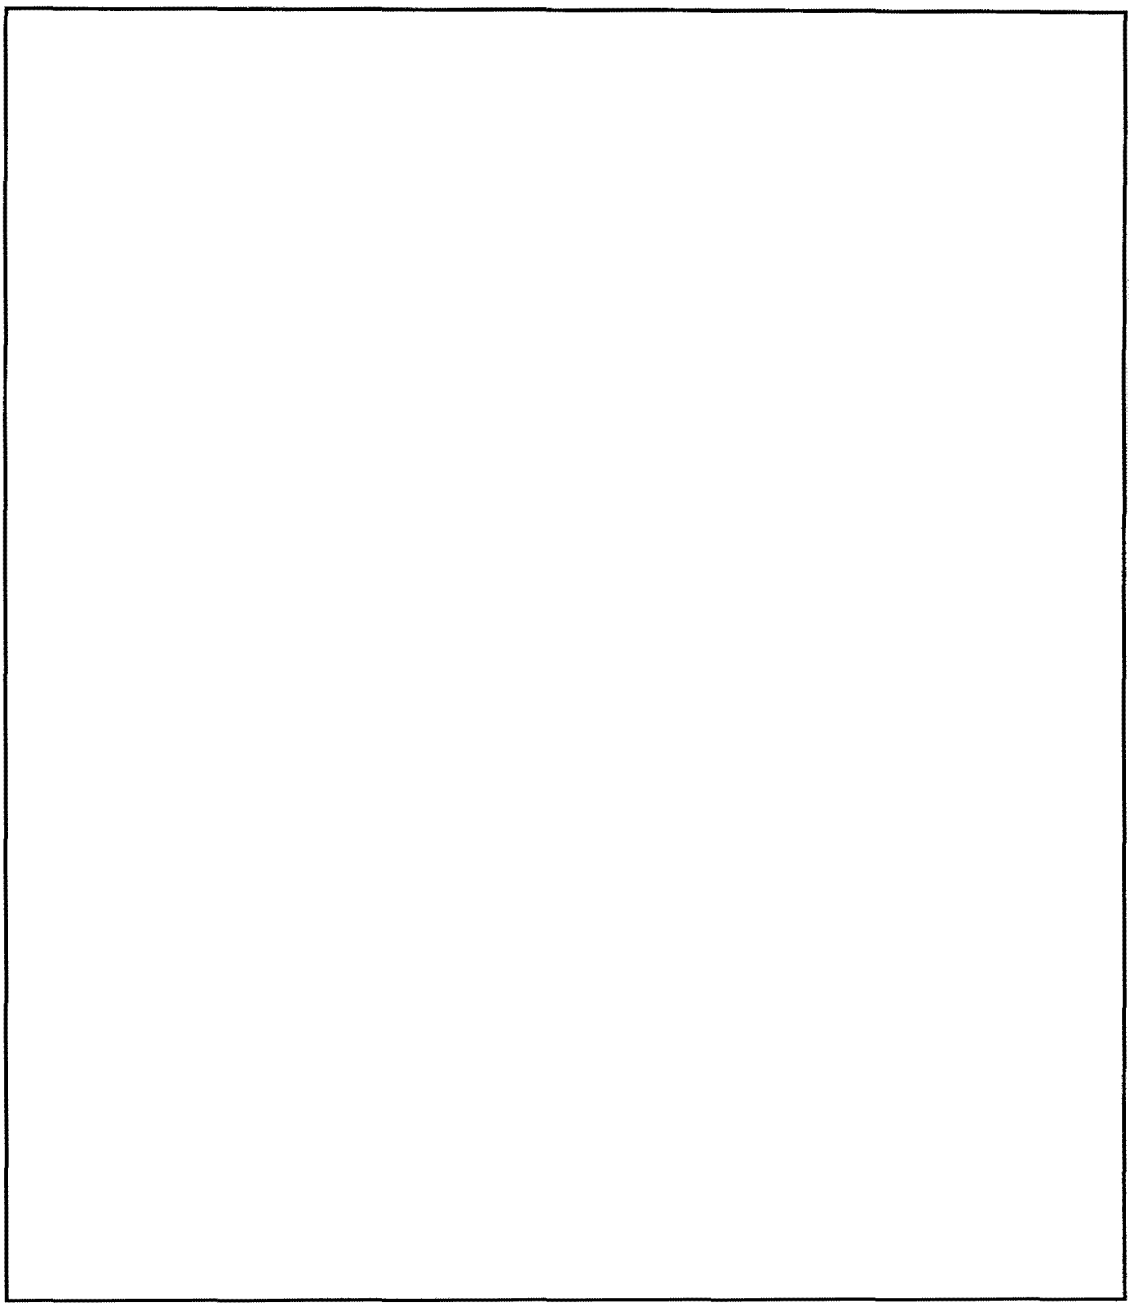


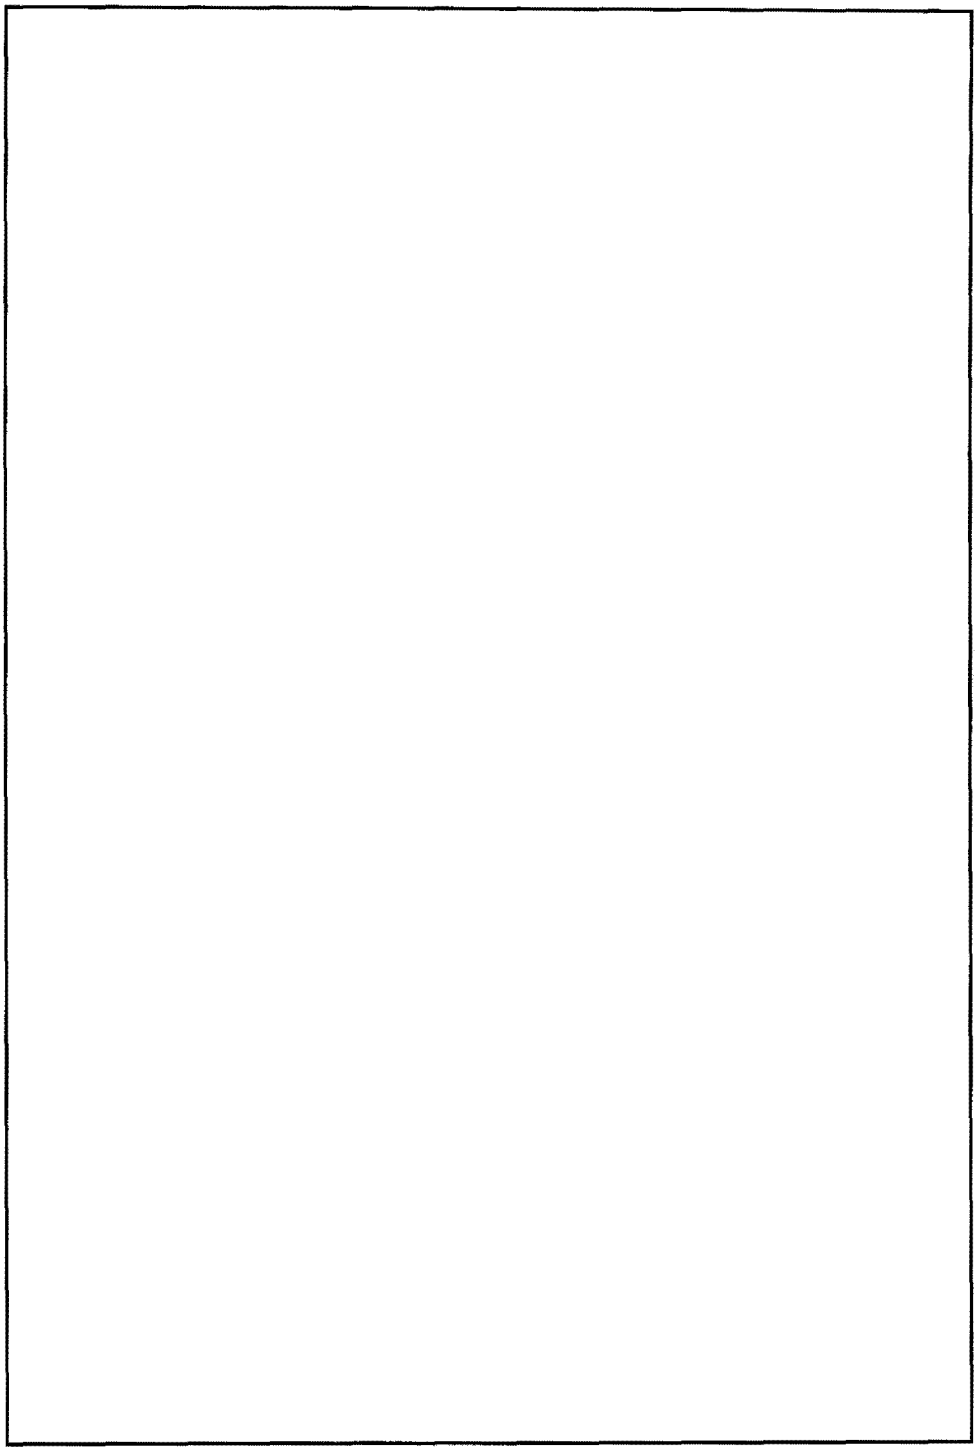


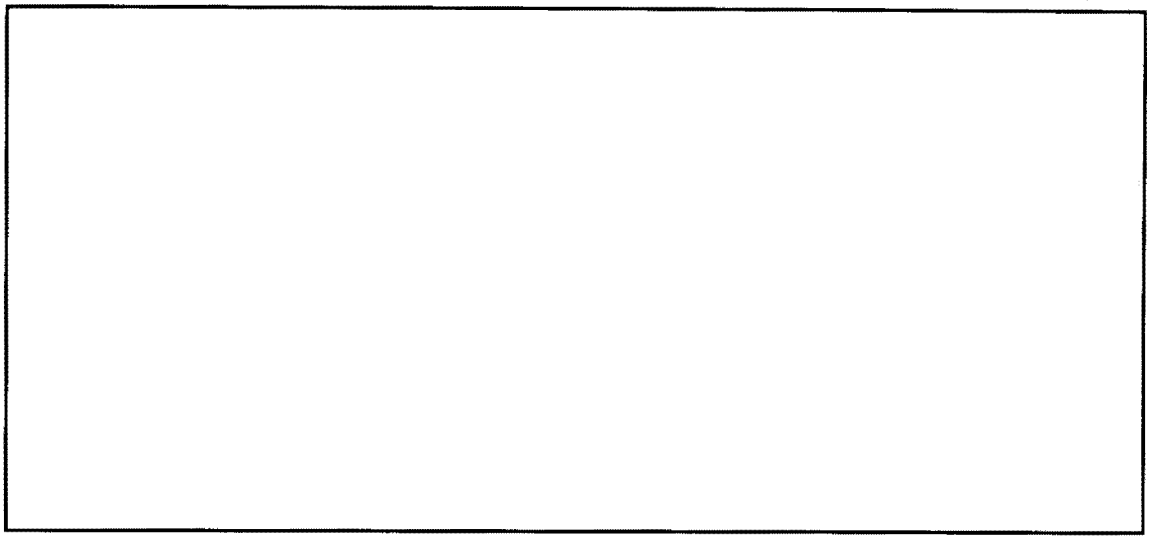












These two examples show how TA crosses many disciplines; it is fluid, unstable in many ways and allows for wide ranges of different techniques and types of systems. Particularly, I have found math to be a very necessary tool in the diagnosis of crypto/TA problems. But perhaps we traffic analysts have neglected to record these applications of math. We have used the concepts of set theory, or VENN diagrams and the like, in research on callsign systems, procedure systems or radio frequency plans throughout all phases of TA discipline. We may, however, have called it by another name. Therefore the query: are we introducing new techniques or new names?

SUMMARY OF PANEL DISCUSSION

The panel discussion held at the close of the two-day symposium attempted to answer the question "where do we go from here?" The consensus was that traffic analysts are, generally speaking, becoming increasingly aware of a need for mathematical expertise and that mathematicians are on the threshold of discovering another field they can support. Most participants in the symposium agreed that they had arrived at a new awareness.

Ideas as to what further actions could be taken following the symposium were summarized during the panel discussion as follows:

a. Mathematical training for traffic analysts

b. Exposure of some mathematicians to TA problems and TA work areas

c. Establishment of a register of mathematicians and traffic analysts and their respective skills

d. Establishment of idea-exchange groups where problems may be described and analytic approaches recommended

e. Documentation of TA-math uses, ideas and developments

f. Development of multidisciplined analysts

g. Establishment of a focal-point (s) for TA-math ideas and problems

Let's Not Lose Our Skills

[redacted] P.L. 86-36

One thing a middle-level supervisor in the Production organization realizes very quickly is that good traffic analysts are hard to find. Those traffic analysts with a skill in a specialized area such as frequency and callsign recovery are scarce. [redacted] P.L. 86-36 EO 1.4.(c)

As indicated in the A/DDO memorandum, the underlying causes for this decrease in traffic analysts are the rapid change to automated methods of collecting and producing SIGINT, and the personnel limits imposed on the size of the NSA work force. Since NSA cannot hire personnel to fill shortages in critical skills, the traditional skills have been reduced to accommodate increases in linguists, signals conversion personnel, collection technicians, and data systems analysts and programmers. As a result, we are creating a static pool of traffic analysts, retarding the development of our analytic talent and altering the career-progression patterns of the traffic analytic work force. It is these effects that I wish to discuss.

The end of the Vietnam War, the subsequent tightening of purse strings and the resultant reductions in traffic analytic spaces altered the availability of traffic analysts. By limiting the hiring of new traffic analysts and not replacing those lost by attrition, the size of the analytic career field was set [redacted] The immediate effects were minimal since the number of traffic analytic jobs was also decreasing, with the reduction of many of the timely requirements for information on Southeast Asia. Also helping to offset any immediate effects were the great strides made in mechanizing the traffic analytic processes during the Vietnam War. Efficiencies had been created and a degree of timeliness using methods of intelligence production never before possible had become routine.

The long-range effects probably will not be apparent until the late 1980s, but some symptoms are already beginning to appear. Our traffic analytic work force is getting old. Most of the younger analysts were hired during the 1960s and are now GG-11s or higher. Most basic traffic analytic work is now done by the military, either at the field sites or at NSA. No substantial group of young analysts at the lower grades is available for the future. The most aggressive analysts have already moved into management positions to further their careers. To aggravate what is rapidly becoming a bad situation, we have retarded the development of the younger traffic analyst. In the earlier growth days of our agency, a traffic analyst could grow in a specific target area, become recognized as an expert, and advance in grade and responsibility within his chosen career field. Today, the aggressive young analyst soon recognizes that his future is not in the technical side of the

traffic analytic business. To advance and achieve a modicum of success, he must move into management or to one of the critical-shortage skills. Consequently, we deplete our analytic talent base, and few people are left to form a nucleus for the future.

Those who are left usually have a sincere desire to remain in the technical side of the intelligence production business. Even those people are prodded by management to move into the more critical areas of data systems or linguistics. Since chances of promotion are mathematically better in these skills, many of the remaining talented young people do indeed transfer.

Those who remain face a slower career progression since the money provided for the special considerations given to the critical career areas reduced the total sum that would normally be equally divided among all those eligible for promotion. This means the traffic analyst must face stiffer competition for the promotions that are available, and ultimately his chances to achieve a position of leadership within the Agency are diminished.

As a result, probably in the near future, we are going to be faced with a severe analytic shortage similar to that which we now have with linguists. A more serious consequence will be the loss of analytic skills that can be learned only by years of experience. Specialists will be nonexistent, and major analytic recoveries will suffer. Although these problems can be alleviated to a degree by hiring from the SCAs and by programs such as the intern program, these are not immediate solutions. Unlike the data systems and, to a certain extent, the linguistic fields, our colleges and universities are not graduating many traffic analysts. It is a career field where experience is the best teacher.

To avoid future shortages, we should begin hiring some Traffic Analytic Technicians right now. These technicians could be hired out of high school at the GG-2 level and put through a program similar to that used for training linguists. Given the proper incentives, training, and experience, these people would be ready to take over the analytic work load in about ten years. If we fail to act now, we will have to react later, when our chances of success are fewer. Traffic analytic skills helped make our agency what it is today. Let's keep it that way.

P.L. 86-36

[While [redacted] *article was being prepared for publication, it was shown to* [redacted] *Chief, Traffic Analysis, Office of Techniques and Standards, and he was asked if he would like to add any comments. He has submitted the following addendum. Ed.]*

We could *also* hire ex-military traffic analysts, as we have in the past. This has the advantage that each "recruit" already knows what TA is, likes doing TA, and wants to make a career of it. That cannot be said of high school hires, and one must therefore expect a higher rate of "drop-out" than would apply to those already trained and experienced in TA (ex-military).

There must, of course, be some disadvantages to hiring ex-military traffic analysts. Otherwise, an agency as smart as we are would already be doing it.

LETTER TO THE EDITOR

~~(FOUO)~~ One of the advantages of being associated with a program such as the Traffic Analysis Intern program is the opportunity to watch the big picture develop. For three years I watched the traffic analysis career field being continually rescued from threats to its survival that came from whatever managerial wonders happened to be exerting influence at the time.

~~(FOUO)~~ While specific to the TA experience, these remarks point out the crucial aspects of organizational life: organization, corporations, or whatever, are really people. Hiding behind the various bureaucratic identities cannot disguise this reality. The "health" of the people affects the organization's. When people stop caring, growing, and producing, the organization ossifies and eventually fails.

~~(FOUO)~~ Personal career and organizational development are intimately linked. This agency has taken vital steps to facilitate career development, thereby assuring its future. This month's Career Development activities are a celebration of this process – in the past, present, and future – and its meaning for us and the Agency.

ROBERT HANYOK

AND FROM AN OVERSEAS READER . . .

P.L. 86-36

To the Editor, *Cryptolog*:

~~(S-CCO)~~ [redacted] article, "Let's Not Lose our TA Skills," (*Cryptolog*, March 1979), made an untimely appearance here [redacted] The week before it arrived, several of the people here, due to return to NSA in the near future, had attended reassimilation briefings, during which the overstrength skills problem was not only raised but also given as a rationale for the reassignment of some to a different career field. Some of the moves were in the out-of-TA direction! It's easy enough to fall out of touch when headquarters is an ocean away, but it's even easier to be confused by the apparent contradiction between the M3 view of TA as an overage skill, and the view shared by [redacted] that TA is a field with an impending shortage crisis. Perhaps some of the fifty-odd traffic analysts now in excess could be used to head off the coming shortage. The concern about the effect of transfers out of TA and the lack of new blood is shared by many. This feeling was expressed here recently by visiting managers, who stated a need for analytic talent to work in the rapidly expanding world of multichannel communications.

P.L. 86-36
EO 1.4.(c)

(U) What all of this may boil down to is the ever-present problem of individuals holding the title but not doing the analytic job, and the apparent inability of management to cope with this issue. *Good* traffic analysts are hard to find, and so may be talent in other

overstrength skills; the key may be quality vs. quantity, another problem that's always with us. If nothing else, [redacted] article may make some managers realize that skill balance by the numbers is not an end-to-all-your-troubles elixir for reducing the work force, and that talent returning from overseas should not be regarded as a magic ingredient for such a brew.

KATHY BJORKLUND

Letters To The Editor

Last month Cryptolog *printed a letter from Kathy Bjorklund in which she wondered why the view of traffic analysts as a vanishing breed, which has been expressed in* Cryptolog *by various people, is at such variance with the M3 view of TA personnel as an overstrength category.*

To the Editor, *Cryptolog*:

(U) Since you were kind enough to ask me for a comment on Kathy Bjorklund's letter, I felt obligated to break out [redacted] article, to which she referred. There are several hot spots in those two items and one that rises from them.

(U) First, *Cryptolog* has traditionally been an open forum, and I would not change that. But we who write for it from time to time are obligated to do some homework before we present opinions that aren't defensible. Or, maybe it's time to label fact and opinion so that readers can sort them out.

P.L. 86-36

(U) For Kathy, here are a couple of facts. While your briefing on reassimilation and career field overages was probably conducted by personnel or administrative people, they are not the ones who made the decision that TA is an overage field. As your Chief of Personnel Services, [redacted] could have told you, M3 is part of Management Services (DDM), and it is a support or service organization that attempts to meet *requirements established by other Key Components*. In this case, it was Operations (DDO) telling M3 that there were overages in the TA field and shortages in the language field; it was DDO telling M3 to initiate the needed personnel actions, e.g., reassignments and hiring. Can you imagine the confusion if M3 went about willy-nilly hiring and reassigning people against no known requirement?

(U) Another fact is that George's article is mostly opinion. Now he has as much right as anyone else to have and express those opinions, but he knows he will get some arguments. For example, we not only lost good analysts when some TAs moved into management – we also gained some bad managers, although that's not a problem peculiar to the field of TA.

(U) But by and large, I doubt that you could find anyone who has to pick up the tab in billets or skills balances who would say we have any current or near future shortage of traffic analysts, or of TA technicians to fill the vacancies that will some day exist in the analyst ranks.

(U) Comparing real and present shortages in the language and computer arenas to "maybe" shortages ten years down the pike may not be a fair analogy. The computer and language shortfalls are there because we have added jobs or lived with vacant positions. In the field of TA that has not been, and is not now, the case.

(U) Since most of our TA overages are at the technician level, I'm not sure I understand George's suggestion that we hire more technicians. But my not understanding is irrelevant – we aren't going to hire against a nonrequirement, at least not if I understand the way things work.

(U) Back to Kathy's letter for a final comment on her last statement: "...talent returning from overseas should not be regarded as a magic ingredient for such a brew." Given our selection processes, increased promotion points, and preferential treatment in assignments upon return for field people, I am a bit surprised that you believe there is an *intentional* negative attitude toward returning field people. And my opinion is that DDO, DDM, DDR, DDT and DDF would be equally surprised.

(U) Regards to you, Kathy. Congratulations to you, George. And, Dave, whenever you want an opposing view on almost any subject, please give me a call.

DAN BUCKLEY

To the Editor, *Cryptolog*:

(U) I read Kathy Bjorklund's letter with a feeling of depression – because what she says is all too true. The bodies-and-slots, or bean-counting, approach to personnel assignments is not one that is conducive to the continued development of the technical work force of the Agency.

~~(C)~~ During the skills requirement forecast of 1973, the career panels were asked various questions on personnel development covering the period FY74 through FY79. Questions such as the following were asked:

- What effect will new or emerging technology and modernization of cryptologic operations have on the skills under the purview of your career panel?
- Do you anticipate a need for developing multiskilled specialist, and if so, which skills or combinations of skills will be required?
- Will the need for specific skills (TA, CA, etc.) decline or increase?

(U) I don't know what happened to the results of this poll, since current personnel planning does not seem to reflect them, but rather continues to be based on projections of the current work force: How many people do we have in such-and-such COSC? Well, then, if we have that many, and if we are getting the work done, then that must be the right number. So let's just straightline that number for the next four fiscal years. Obviously, this approach is the basis for faulty TDs, since it makes no allowance for any shifts in requirements brought about by shifts in targets or other considerations.

~~(C)~~ Let's see how this works. At the moment Traffic Analysis is carried as an overstrength skill in A Group. The TACP [Traffic Analysis Career Panel] has two interns due to graduate this month. On the basis of their backgrounds, experience, the panel's recommendations and their own preferences, these interns should be assigned to A2. But

the thought of placing them in an overstrength element is enough to give the bureaucrats heartburn.

~~(C)~~ The placement of overseas returnees is similar. P41 attempts to assign personnel holding A Group overage skills to B, G, V or W; only a few of this year's returnees have been assigned to A.

~~(C)~~ In short, P41 and M3 will almost always stand in the way of any assignment to an overstrength element. I have accused P41 of approving TA intern placements using the bean-counter approach. They deny this vehemently yet state in writing, in a memo to Chief, M3:

[redacted] P.L. 86-36 E.O. 1.4(c)

A fair share – by the numbers!

(U) [redacted], quoted by Ms. Bjorklund in her letter, are correct: the number of traffic analysts is dwindling. Part of this is attributable to the reasons cited above. Another rank-thinning factor is age. Almost twenty percent of the people in COSC 1411, Traffic Analyst, are over fifty years of age; less than two percent are under thirty.

(U) What is the solution? As I see it, it is twofold. An immediate measure would be some directed assignments. This would include the identification of personnel holding a given COSC in an overstrength area, but not performing that function, and making appropriate readjustments, such as transfer, retraining or reclassification. It would also include the placing of overseas returnees in areas where their skills are most needed, even where they might be a temporary overstrength condition.

P.L. 86-36

(U) For the longer term we must nurture the TA intern hire, insuring that we have at least six to ten coming in each year, and placing them in the work force where they will produce for the Agency regardless of numbers or quotas.

~~(C)~~ Let me quote from an old-time member of the TA corps:

> How long does it take to build a professional traffic analyst from zero? If it takes, say, five years, then we are betting that whatever the situation is today, it will be the same five years from now. And what we are betting with is the Agency's reputation for adapting to fast-breaking changes in the world situation.

~~(C)~~ The TA intern program can and does build a professional traffic-analyst/reporter from zero with a very solid understanding of the interrelationships of the other cryptologic disciplines. The annual hiring of a few bright people – recent college graduates as well as former military analysts – should solve the problem of being able to find good traffic analytic talent in the future.

[redacted]
Executive, TACP

To The Editor, *Cryptolog*:

(U) Having had long, and often passionate, discussions with both Mr. Buckley and Mr. [redacted] on the subject of Traffic Analysis "overages," I was surprised to see that both gentlemen missed several important points (see Letters to the Editor, *Cryptolog*, July 1979). P.L. 86-36

(U) First, I think (please note, opinion) there are a fair number of individuals who hold TA COSCs who are not doing TA work. One example: a branch chief is a manager, not an analyst, yet the analytic COSC is often held.

(U) Second, quality is not an element included in the "bean-counter" approach; it's the number of bodies bearing the title that are counted. The fact that one quarter of the bodies may be doing three quarters of the work does not enter in.

~~(C)~~ Third, we seem desperately intent on trying to "professionalize" (read, certify) ever-increasing numbers of people in overage fields. The problem with this is twofold:

- What is the purpose of creating many more professionals than we have professional billets? What is the purpose of allowing second certifications in overage fields?

- Why are we tutoring professional aspirants? Individuals of professional quality will, like cream, rise to the top by dint of personal study and research. They will do so simply because it is in their nature to excel, not because they were pushed, prodded or carried through the test. (Please note that "top" refers to one's ability to perform, not to one's promotion record.)

~~(C-CCO)~~ I agree with [redacted] – we *are* losing our TA skills (See *Cryptolog*, March 1979). It is evident in the simple fact that many case analysts do not log intercept in such a manner as to see a simple rota. It is reinforced by the fact that on our professionalization exam the net reconstruction section is pre-logged and fairly easy. The difficult section is the crypto-TA part, and few traffic analysts are charged with this type of responsibility in their daily jobs.

(U) Suggested solutions for eliminating the overage and upgrading the quality are fairly simple. Ensure that only those doing traffic analysis carry that COSC; let's start calling managers managers. Next, devise a weighting system so that a manager can state for the TD that he needs three topflight TAs, or five average, or ten below-average (or some combination thereof) to accomplish his mission. And, finally, if we feel compelled to tutor someone, let's begin by tutoring those most in need so that they may become proficient in their current jobs.

(U) Years ago achieving professionalization was akin to winning a place among the elite. Today is simply a means of proving oneself average. Elitism is not only dead, but is scorned as well.

(U) Let's put the emphasis back on the quality of our human resources.

[redacted]

Simplicity in Color

C. GAROFALO

The conduct of crypto-TA studies involves the requirement to differentiate between qualitative levels or categories, and the use of a simple color scheme facilitates such differentiations. Any color scheme to be used in an analytic effort of large volume must be

- simple in nature,
- skillfully chosen, and
- systematically applied.

An analysis of the various colors available was made to determine which are practical and most suitable for the task. My experience has demonstrated that six different colors are most practical. These are black, green, red, blue, purple, and brown.

- Black – carbon (number 2) medium degree of hardness and density, suitable for both erasure* and longevity properties.
- Green – is the weakest, that is, of lightest density. All of the other colors under consideration superimpose on green quite readily.
- Red and Blue – are of equal boldness; either can be easily superimposed on both black and green.
- Purple – a bolder color that can also be produced by a superimposition of red on blue or blue on red.
- Brown – is considered to be the boldest of all colors as well as the most exclusive and conclusive.

Colors manufactured by different commercial firms vary drastically in hardness, density, and coloration; it is desirable, therefore, that having started with a particular brand to continue with that brand and not intermix brands to ensure that distinctiveness and clarity are maintained.

A color ladder may be displayed graphically as follows:

Color	Level
BROWN	5
PURPLE	4
BLUE	3
RED	2
BLACK	1
GREEN	0

* For Black erasures, a medium hard rubber erasure is adequate. For color erasures, best results are obtained with a typewriter eraser.

Another way to express the levels of the color ladder is by these definitions:

- Brown – The ultimate in degree of trueness, not to be questioned. May also represent captured, compromised information or its equivalent.
- Purple – High in degree of reliability; may be used as a substitute or companion for brown where special conditions of clarity or distinction are vital to the problem. Primarily useful as a final ordered and oriented intermediate enjoying the same general stature as brown.
- Blue – A relative base value having a significant bearing on the state of recovery.
- Red – A base of lesser value or no relativeness (completely arbitrary), a first step necessary in any endeavor.
- Black – To record or log information as it appears in its earliest or original form.
- Green – An envious color reserved completely for suspected garbles, projected or expected but unobserved values (not proven but highly suspected as being correct). Used to alter a meaning or information without obliterating the original (black) form.

Once a color scheme is established for a given problem, maintenance of color discipline is mandatory in order to achieve uninterrupted and unambiguous continuity. Discipline is also of great benefit to management in that it ensures that redistribution of analytic personnel can be effected with minimum disruption to the overall effort.

Postscript:

<u>Colors:</u>

Green	symbolized hope to the ancient Egyptians;
	in the Middle Ages was supposed to be good for the eyes;
	to the Mohammedan, a sacred color;
	in modern times has come to signify envy.
Purple	to the Tyrians and Romans, a purple robe or band of purple signified authority; became a symbol of majesty to the Romans.

The Impact of ARDF on Traffic Analysis

ALLEN L. GILBERT

The Vietnamese conflict and techniques for collection of signal intelligence developed and employed in that arena have profoundly influenced the traffic analytic approach to the Vietnamese Communist problem. One of the most effective techniques employed on a large scale in Vietnam has been Airborne Radio Direction Finding (ARDF). ARDF, in addition to revolutionizing the direct support of tactical units through timely and accurate locating of enemy units, has almost reversed the traffic analytic approach to maintaining continuity and developing new targets in some areas.

Traditionally, the traffic analyst is faced with the problem of reconstructing a communications complex through recovery of callsign and frequency systems, message externals, schedule activity and those rare compromises made by enemy communicators. This route usually requires close scrutiny and cataloging of the elements of intercept through an extended period of time, with the hope that a transmitter location will be compromised or that medium-range direction finding will suggest a location for the activity. ARDF provides a location [redacted] P.L. 86-36 EO 1.4.(c) The availability of ARDF on target transmitters considerably shortens the period of development for new activities and provides almost instant continuity on targets effecting communications changes.

In Vietnam, the concept of ARDF tasking provides coverage in all areas of hostile troop activity. [redacted] When aircraft are deployed to a target area daily, the recovery of the signal environment in the area builds rapidly.

Certainly, all other elements of traffic analysis must then come into play to establish case notations and identifications. ARDF alone does not solve the problem, but what an advantageous beginning it provides!

Barometer - Readers' Comments

Traffic Analysts: Write it Down Now!

In approaching a traffic analytic problem for which you have responsibility, have you ever wondered how any of the major callsign systems, procedure tables, address systems, or other complex phases of transmission security were solved, or what significant characteristics contributed to their solutions? It is highly unlikely that you could find a detailed written description of the analytic effort involved in any of these solutions, so you would have to go to the individual who had been most intimately concerned with it, the individual recognized as having had the responsibility for providing the technical direction toward the solution. He is *the* person who was confronted with the problem, recognized its difficulties, determined analytic approaches, made mistakes, went up blind alleys, made critical decisions, directed other analysts, and generally supervised the entire effort. Assuming that he is available, you could ask him to describe the entire process. There is a good chance, however, that because of passage of time or lack of thorough documentation, or both, he would find it difficult to reconstruct in detail the path and the thought processes that were followed in reaching the solution. Thus, valuable expert knowledge, which might be useful in the solution of current or future problems, would have perished.

How can the loss to posterity of expert knowledge in such a situation be avoided? Very simply, the analyst who is pursuing a specific problem should *keep daily notes* on his analytic activities, his thoughts, his approaches, his mistakes, his conclusions, etc., and then, upon arriving at a solution (or failing so to arrive), *prepare a detailed written record* from these notes. The record, to be of most value, should describe the entire effort from a strictly chronological viewpoint, so that the influence of hindsight might be avoided.

If this practice had been consistently followed in the past, the Agency would now have in permanent form a wealth of analytic expertise that led to past successes but that is now unfortunately past accurate recall. The practice should be followed by every analyst who is pursuing a specific problem, whether it is large or small: he cannot predict where his efforts may lead, and he may be making an important contribution to the overall body of traffic analytic knowledge.

[redacted]

P.L. 86-36

How Many Angels Can Stand on the Head of a Case Notation?

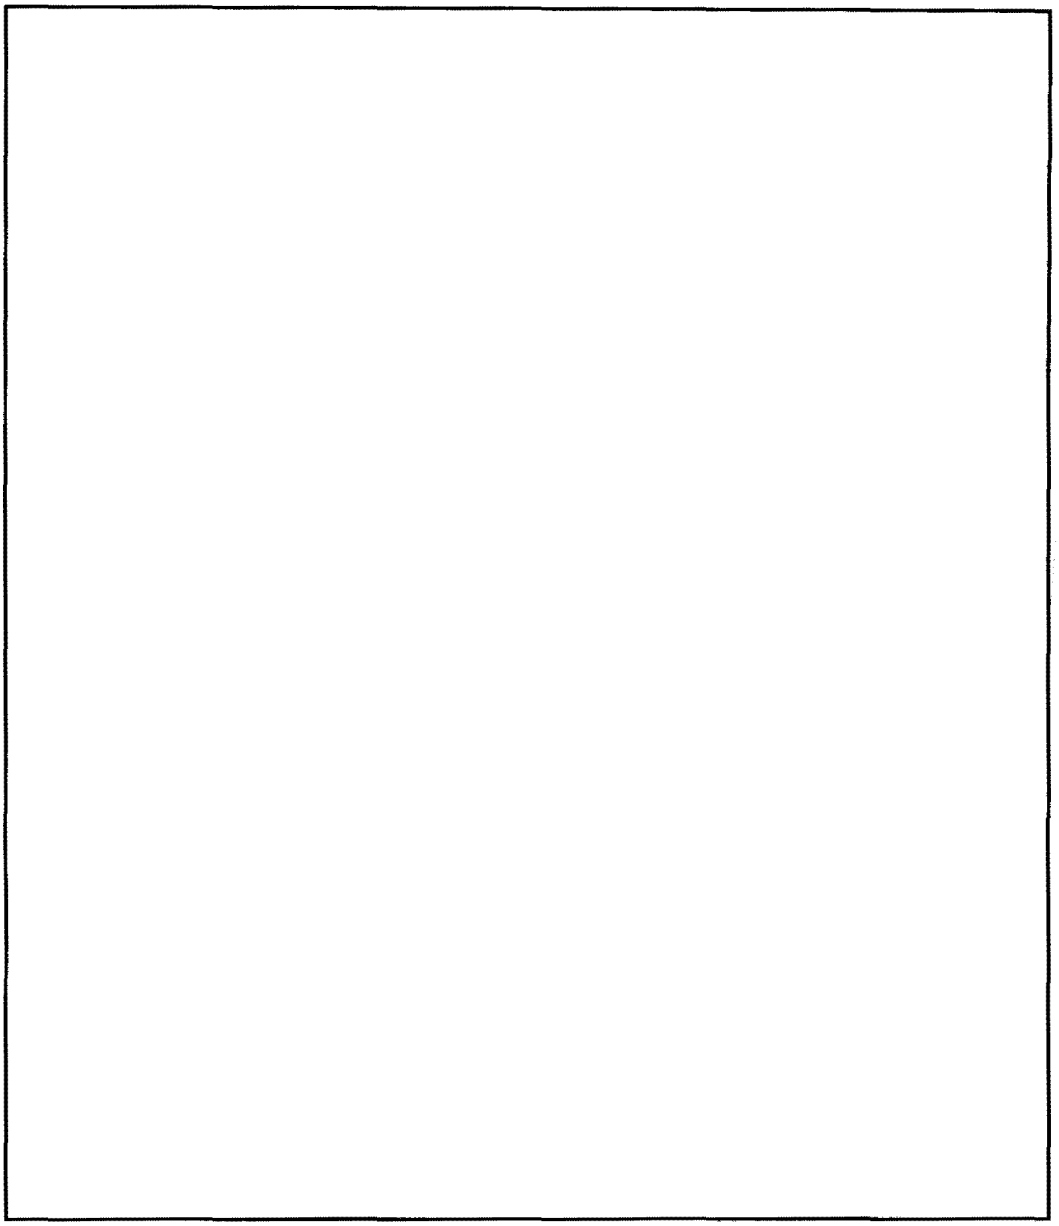
P.L. 86-36

[redacted]

~~(S-CCO)~~ Most persons can recognize a case notation as such, even though formats differ. Few can *explain* one unless it is one worked with daily. This is because notations contain over fifty categories of information, and each of these has sub-items ranging from four or five up to about 800. In short, there must be over two thousand coded meanings. How can this happen? In addition to the unstandardized [redacted] P.L. 86-36 [redacted] notations, the digits of the so-called "serial" are actually used as codes, singly or in combination, for the various categories shown below. Sometimes a given digit may have two meanings within a given notation. Also, the information selected for representation varies from target to target, from trigraphic source to trigraphic source, and even within the latter. E.O. 1.4.(c)

Some of the Information Contained in Case Notations

[redacted]



The 1980s and Beyond

Traffic Analysis: A Current Perspective

CW2 JAMES HOPPER, USAFS

P.L. 86-36
E.O. 1.4. (c)

~~(C)~~ Traffic analysis (TA) today is beset by a variety of problems affecting the analyst, not the least of which is a lack of understanding concerning the separate functions which comprise traffic analysis. Contrary to popular definition, the traffic analysis field of today encompasses much more than the mere analysis of communications externals. Traffic analysis consists of six separate functions:

- Collection Management
- Collection Support
- Processing
- Analysis
- Reporting
- Evaluation

These are intended to be mutually supportive of each other. However, because both managers and analysts lack understanding of the interrelationship that exists between and among these functions, they all too often are performed at cross purposes, with one function inadvertently affecting the success (or failure) in a follow-on activity. In these days of meager collection and analytic resources, it is imperative that an understanding of the relationship bonding the six functions of traffic analysis be fostered at all levels to ensure the complete and proper use of these resources.

~~(C)~~ To function effectively in the traffic analysis world of today, the traffic analyst must have a rudimentary knowledge of several areas in addition to communications externals. Among these areas are

Collection Management, including the Collection Objective Performance Evaluation Systems (COPES) and its follow-on, Collection Evaluation System (CES) statistical reporting;

Collection Support, including knowledge of working aids available to assist in collection and identification duties, as well as of target characteristics that can support both current and future collection operations;

Processing, including Automated Data Processing (ADP) routines available to assist in manipulating the intercepted data for subsequent analysis;

Analysis, including sufficient knowledge of the various traffic analysis techniques and target characteristics that develop information to satisfy consumer requirements;

Reporting, including the criteria and appropriate reporting vehicle for providing information to satisfy consumer requirements;

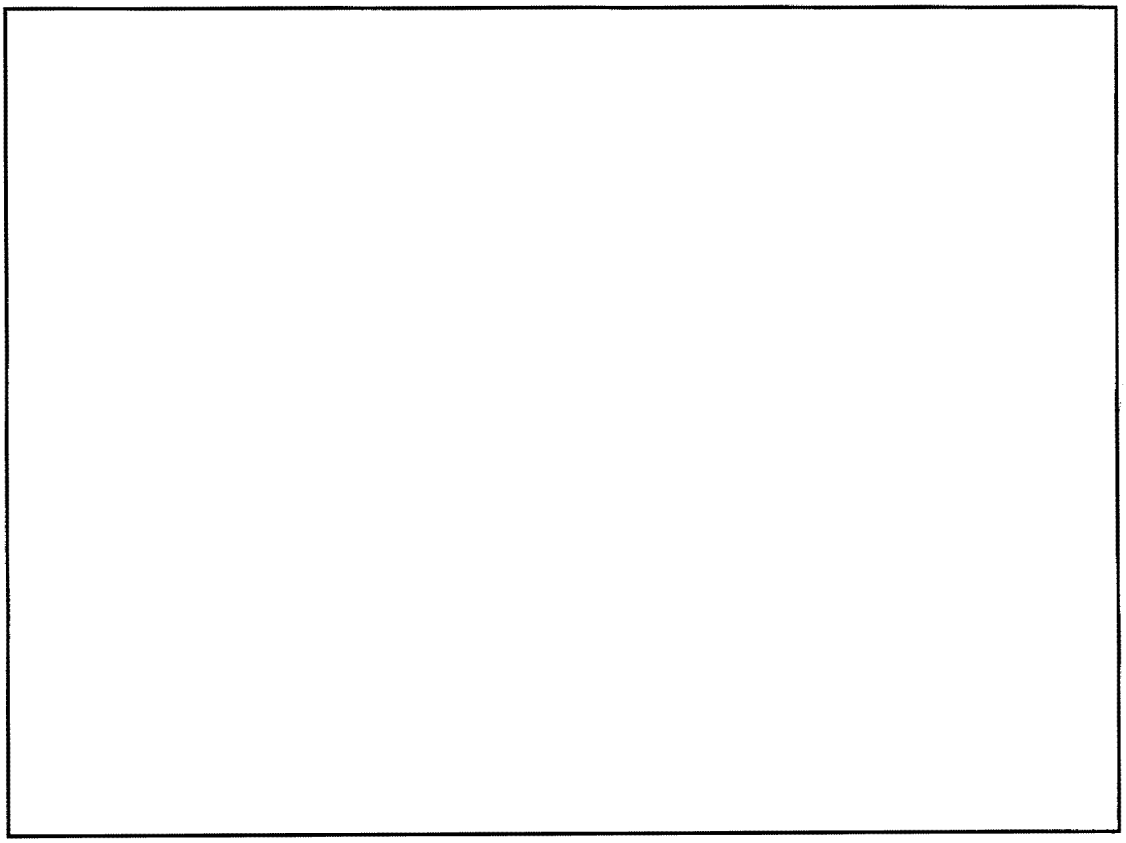
Evaluation, including the techniques available to constantly monitor and compare tasked and acquired collection so as to redirect these resources to areas of the target's communications that are susceptible to exploitation; and

Perspective, including a thorough knowledge of the target's order-of-battle (OB) structure that underlies the target's communications, as well as a thorough understanding of the target's past history from which to view changes in the target's communication habits.

A lack of knowledge in any one of these areas can ensure failure in attaining the ultimate goal of consumer satisfaction. Additionally, an incorrect managerial emphasis on any one function over another will also ensure failure in attaining this ultimate goal.

COLLECTION MANAGEMENT

(U) The first function to be encountered by the traffic analyst is Collection Management. It is at this point that the consumer's requirement is translated into specific collection tasking to acquire the needed information.



P.L. 86-36
E.O. 1.4.(c)

[redacted]

COLLECTION SUPPORT

Once the tasking is accurately developed and transmitted to the field site, the next function, collection support, determines the success or failure of a field element in satisfying its tasked requirements.

P.L. 86-36
EO 1.4.(c)

[redacted]

(U) At the local level, field site managers usually are faced with a decision of where to use their most talented personnel; an effective collection support element or an effective analysis and reporting effort. Unfortunately, all too often the choice is for the A & R effort because of the high visibility of analytic breakthroughs and consistent product reporting.

(U) This decision on the part of the field manager leaves the collection support effort with poorly trained analysts, generally those with the least experience in TA duties. These individuals are then placed in the fast-paced environment of the collection floor, an environment that breeds confusion and is the least likely place to learn the functions of traffic analysis.

(U) In addition to the assignment of poorly training personnel at the local level, at the national headquarters level technical support material is seldom provided in a manner that facilitates its use in the field. Most often this material is seldom provided in a bulk manner, which dictates tedious manipulation in the field to extract desired information. Yet this same manipulation is often performed with the national headquarters on a daily basis through various computer routines but is not made available to field sites. Thus, while a steady and voluminous stream of technical support material is provided to the field element, it is seldom provided so that the field can easily use it, and it is often too unwieldy to be used on the collection floor, with all its hectic activity.

[redacted]

Of these, the misidentification rate should be of the greatest concern since it dramatically impacts on the processing, analysis, reporting, and evaluation functions that follow the collection support function. A poor case (notation) identification rate in the collection support function means that all case identifications received for processing must be verified to ensure that the correct notation is applied, a time-consuming process for an individual already strapped for time in performing his or her other processing duties. Failure to verify the correct identification on all cases can have disastrous effects

- on processing, necessitating complete revisions of case history records;
- on analysis, which attributes incorrect technical operating characteristics to the wrong case;
- on reporting, which provides false information to the consumer; and
- on evaluation, which attributes tasking satisfaction to the wrong target.

To ensure the most effective collection support effort possible, field managers must develop an operational system that exposes all elements of the assigned analytical work force to both collection support duties and desk analysis duties. Ideally, such a system, which rotates the individuals between these two worlds, will ultimately increase the expertise levels available in both areas. Likewise, at the national level all methods of developing collection support material for field elements must be closely scrutinized to ensure that a minimum of manipulation is required on site to use the data.

PROCESSING

~~(C)~~ The next function of traffic analysis, processing, often assumes a life of its own. From the analyst's standpoint, processing (or, to use a more common term, "logging") quickly becomes associated with drudgery. The fact that processing is accomplished merely in order to organize intercepted data for subsequent analysis is quickly forgotten. Processing then becomes a mindless transfer of data from one medium, the raw intercept, to another medium, the casebook or database. Further, this attitude quickly leads to overlooked items of significance that otherwise would require immediate analytic or reporting attention.

(U) From the manager's standpoint, however, processing quickly becomes the key productivity measurement because of the statistical data available from database maintenance inputs. Since the underlying desire is for an accurate database from which to extract material for subsequent analysis, and from which to drive any automatic collection support vehicles that emanate from the database, the manager's concern becomes one of concern over database maintenance accuracy and volume. Unfortunately, this concern for accuracy normally translates into a concern over the correct formatting of the input rather than over the validity of the information itself. Likewise, the volume concern translates into a meaningless "body count" that is used to spur further productivity.

P.L.86-36
E.O. 1.4.(c)(c)

poses should be deleted from existing requirements. For example, the processing of voluminous message serialization data should not be imposed on the affected analyst if no one intends to perform a study of this aspect of the target's communications. The processing requirements should be continually geared to the voids of the target's communications that need to be exploited, and not to those characteristics that are commonplace and seldom change, as these voids are reduced through exploitation.

ANALYSIS

[redacted] underlying military force must be the first priority of the traffic analyst. Only through such mastery can an analyst understand the communications facing him or detect changes in those communications that can be attributed to something reportable. In addition to ensuring that the analysts are knowledgeable of the structure of the military force, managers at all levels must ensure that the analytic studies to be undertaken first have the potential of either satisfying established reporting criteria or developing material that will aid collection support activities. All other studies, no matter how well-intentioned, are merely a waste of an analyst's valuable time.

P.L. 86-36
E.O. 1.4.(c)(c)

REPORTING

(U) The reporting function is the sum total of how well the earlier functions were conducted. If these earlier functions were conducted in a shoddy manner, they normally will culminate in an inaccurate report that bears little relationship to the consumer's initial stated requirement. Conversely, if these earlier functions were conducted in an orderly manner so that each function supported the following one, the report will probably satisfy the consumer's request. In addition to satisfying the consumer's request, the analyst must also concern himself or herself about using the proper format for the information to be used in the report. Poorly formatted reports, while factually correct, convey a sense of disorganization that can color the credibility placed on the information by the recipient.

[redacted]

(U) Both of these rationalizations have effectively downgraded the opportunities available to the traffic analyst to participate in the reporting function, the only function which at present is directly keyed to reporting criteria that match the consumers' requirements. By reducing the analysts' participation in this function, we also reduce their ability to ensure that the previous functions remain directed towards the ultimate

goal of consumer satisfaction. Managers at all levels must emphasize the development and maintenance of effective and imaginative reporting programs that challenge the analysts' skills to ensure that that reporting function does not become divorced from all that has preceded it.

EVALUATION

[redacted]

P.L. 86-36
EO 1.4.(c)

(U) Through their involvement in the evaluation process, traffic analysts are well placed to redirect collection resources to exploitable areas - or at least to areas that have not been satisfied through past intercept - of the target's communications. Unfortunately, the evaluation process is normally either not performed at all, or it keys on indicators that, when viewed alone, fail to provide an accurate reflection of the productivity of the resource.

[redacted]

(U) As should be apparent, the traffic analyst of today is faced with a variety of functions. However, all of these functions are tied together by a thread of continuity relating to the final goal of consumer satisfaction. If these functions are not kept in their proper relationship to each other, either through analyst neglect or improper managerial emphasis, it will be difficult - if not impossible - to achieve a cohesive operational mission

that satisfies consumer requirements. Only through mutually supporting functions, as originally envisioned, can our scarce collection and analytic resources be used to their fullest extent. In other words, perhaps a return to the basics may be in order for the traffic analyst of today!

There's a New World Coming - Are You Ready?

P.L. 86-36

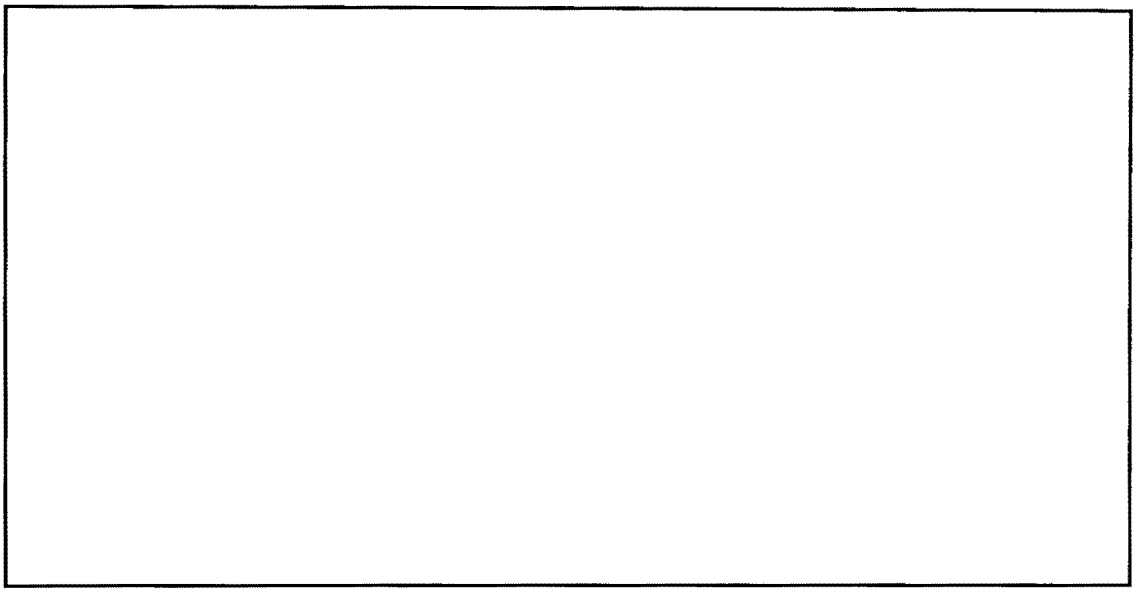
[redacted]

P.L. 86-36
EO 1.4.(c)

(U) Analyst response to a changing environment is an area that has piqued my interest for a number of years. This interest has become especially pronounced in the last four or five years, largely as the result of the increase in the variety and number of automated processes that have become available, my involvement in a number of long-term research projects, and the prospects of newer and more sophisticated machine-based analytic techniques. As a consequence, I have given much thought to the effects that this increased automation will have on the analyst and to what we, as an organization, can do to respond to the challenges and opportunities that will arise.

(U) If we are to accurately assess how the analyst of the future will react to the increased automation of the analytic process, it is necessary to know the analyst of today. This is logical, since the majority of tomorrow's analysts are already on board and active in the analytic field. It also becomes essential to define the functions of the analyst since all personnel who carry the title "analyst" are not analysts by the strictest definition of the word. For convenience and easy reference, I have divided these "analysts" into three categories that I've labeled, for lack of any better terms, "loggers," "case analysts" and "research analysts."

[redacted]



(U) The changes expected as we become more and more automated will alter the methods and procedures currently used in the analytic areas. This will have a profound effect on our operations, but to an even greater extent it will modify the lifestyle and environment of each of the three types of analysts I've defined. Each will be affected in a different way depending on the analyst's perception of analysis, his personality and his ability to adapt.

(U) Once the machine takes over the simple data manipulation and recording functions, the "logger" will become, to a great extent, obsolete. His routine will be upset and his workaday world completely disrupted. He will no longer have his logging to fill his day. He won't know what to do and he'll be completely lost. For those currently having trouble isolating the "loggers" in their outfits, they'll then be very easy to spot. Just look for those people sitting with a blank stare on their faces and for those making nervous movements at their desks as they anxiously try to find something to do. Eventually their names will appear on the list of those who are abusing their sick leave. The real "logger" will never recover from automation. He's lost his place in life. His day-to-day world will have been destroyed, and he simply won't know what to do. For many it will be too late to start over. Others will lack the initiative, while for still others, it's nothing more than a lack of talent. The world will have passed them by. They, of course, will not be to blame. It'll be the machines' fault, or management's fault, or maybe just the breaks of the game.

(U) In reality, the "logger" has always been a clerk with a professional job title and a professional paycheck. He was created by the system, and, with the advent of new automated techniques, will be destroyed by the system. Some will be salvaged. Some "loggers" will regroup, retrain and regain a place, perhaps at the "case analyst" level. Those that can't make the transition will have to be purged since the cost of automated systems will call for a decrease in personnel expenditures.

(U) The "case analyst" will survive and thrive in the new automation. He really never did care for the logging and data maintenance functions associated with his job; therefore, he'll adjust. He'll reorder his priorities and use the additional time now available for the development and analysis that he never could quite get around to under the old semiautomated method of operation. His productivity will increase, and more technical data on his targets will result. The ultimate gain will be the production of more intelligence information in satisfaction of our requirements. The "case analyst" will grow as a professional, honing his skills as he practices his trade, and in many instances will develop into a "research analyst."

(U) The "research analyst" will see few changes in his method of operation as a result of this new automation. He'll have to deal with new databases, new retrieval programs and new equipment, but his daily routine will remain pretty much the same as it is now. He will generally review the same types and amounts of material and work on the same types of projects. He should see some improvements in accuracy and completeness as a result of the elimination of the "logger" and the automation and resultant upgrade of the databases. He will be able to spend less time on the verification and data gathering phases of his assigned tasks and thereby be able to complete more assignments in a shorter time. This will allow a more efficient use of the limited number of "case analysts" and permit us to achieve maximum benefit from their talents. Automation will also improve the morale of the "research analyst" since he will be able to function almost entirely in his primary capacity.

(U) The benefit of this increased automation is readily apparent. The talent of our people can be used to the fullest, with dull, repetitive tasks reduced or eliminated. The timeliness, accuracy and quality of our product will increase. Personnel not working at their prescribed levels can be eliminated, with a resultant savings of money. All of this is, of course, predicated on manageable machine systems that will function as designed. Since our track record for the development of such systems is not impressive, let's hope that we have learned from experience, and not attempt to reap benefits before we have proven follow-on systems.

In Pursuit of: Faster Horses, Younger Women, Older Whiskey, and More Money

P.L. 86-36

[redacted]

(U) For the past two years I have been involved with a project that has given me more in terms of psychic income and pure excitement than perhaps any work-related activity that I remember. When you feel this good about something, it seems natural to want to tell everyone else and share the excitement. It's sort of a "look what I found" feeling. Of course, when you feel excited about something, it is difficult to know whether you have something worth saying and can remain objective about it. Nothing makes you feel quite as foolish as discovering the wheel only to find out that you were the only one who didn't have one all along.

(U) I've followed – from a distance – the articles, letters, and symposia decrying the diminishing number of analysts, the dilution of the career field, and the increasing work load. I really have nothing to add to the body of literature that has grown around those themes. I would like to note that some reasonably intelligent people have advanced them. Conversely, some reasonably intelligent people made the decisions that led to the described conditions.

(U) Having resisted the urge to vent my excitement on paper for this long, I thought I had it under control. Actually, I have been writing this piece all along. Part of my control mechanism was simply typing my thoughts on the screen and then hitting the delete button. That may happen to this version, and you will be spared once again. I'll tell you what "set me off" this time a bit later. First, let me tell you what I've been so enamored with.

(U) I'm a traffic analyst. Several years ago I began to work for the person I respect most in that field and share in the development of what has come to be called a Traffic Analysis Workbench System. Whatever comes of that effort, I'll always be grateful for being included.

~~(FOUO)~~ The idea is a relatively simple one: In terms of technology, the TA field is, and has always been, behind the power curve. Regardless of what high-powered machines exist, and in spite of the fact that some extremely sophisticated machine applications have been designed for analytic purposes, the analyst is still behind. There are several reasons this situation exists. However, it is primarily because analysts are directly dependent upon their machine support personnel. A few have managed (mostly out of frustration) to learn one computer system or another and support themselves. The problem with this is, if they were any good at it, they were usually lost from the field.

~~(C)~~ It's time the analyst was given some help–not to catch up to technology, just to keep from getting further behind. Given the costing cycle, the procurement cycle, and the installation cycle, I'm convinced that catching up is not possible. *Not possible*! The concept of a TA workbench involves installing a terminal on the analyst's desk. Read that again! *On the analyst's desk*. Not down the hall in a "machine room," not in a corner of the basement, and not around the corner where it "won't bother anyone" – *on the analyst's desk, the one he sits at.*

[redacted]

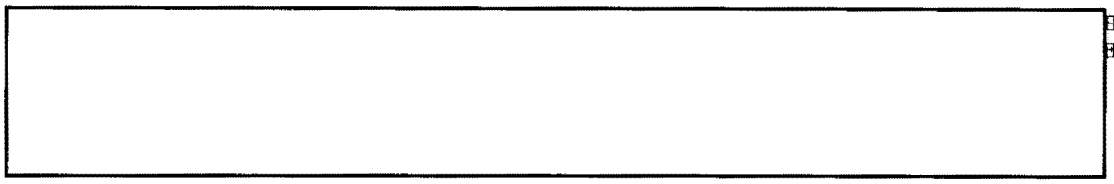
This puts the analyst in a position to access the major databases, where the daily traffic, as well as the technical working aids, resides (hides is a better word). With the terminals on their desks, analysts will have constant access to their material and perhaps approach the paperless environment.

~~(FOUO)~~ Under the umbrella called PINSETTER, we have been proceeding along a development path that will hopefully lead to the kind of help the analyst needs. Because the most precious computer resource is the programmer, the analyst must be released from depending on him for every minor need. This is true for several reasons. First, the analyst needs to be able to access his data, process that data, and change those processes without having to write memos, generate specifications, write justifications, wait for software and then participate in debugging. Second, the programmer as a resource is too valuable to be tied up with changing sort specifications every time an analyst needs a different output. Last, the plain facts are that we have a terrible time retaining good programmers. No sooner do we develop a good working relationship with a top-notch programmer than he begins to understand something about an analyst's job; then along comes a better offer and he's gone.

(U) From a machine standpoint, meeting these goals requires a system that is easy to learn, flexible, and provides a reasonable response time. By "reasonable" I don't mean instantaneous. Most analysts can live with an execution time that is not measured in nanoseconds. Most of our work has taken place on a PDP-11/70 host using UNIX as the operating system. UNIX is a high-level language that was developed by Bell Laboratories. It meets the above criteria, and it is very forgiving to a klutz at the wheel.

~~(C)~~ We have found that most of the processes that a traffic analyst needs to be able to do can be accommodated with the UNIX package. Where it was found lacking or inefficient, the solution has been provided by a unique working relationship with a small group of highly talented programmers in T333.

[redacted]



(U) To digress for a moment, the realization that certain processes are simply too big for TSS applications is important to maintaining a proper perspective. This determination must be made, and large "number crunching" must be performed where the processes are most efficiently handled. However, the process can often be executed where most efficient and the results passed to where they can be best used, on the TSS. I might add, in two years of handling TA processing, it has been necessary to "send out" only one job for actual execution on a "big" machine. Of course, many of our extracts from major databases are "preprocessed," prior to transfer, to make them more TSS friendly. But I discount this, since it is largely "invisible" to the requester.

~~(FOUO)~~ If the solution were apt to provide a useful " UNIX-extension," we would request T333 help. The results have been the most rewarding part of this experience: generalized UNIX-like utilities that solve analytic processing problems. The big plus? *Anyone* who knows a little UNIX can use them. On the other hand, if the solution appeared to be problem specific, we would attack the problem with our own resources. The results of these efforts have proven equally rewarding. Based on our own experience and some operational testing in analytic elements of A3, B2, B5, G6, and G9, I'm not sure if a more effective analytic tool than UNIX could have been designed if that had been Bell's intent. This leads to a philosophical difference in user support design.

~~(FOUO)~~ There is a mask-and-menu school of thought that holds to the belief that the user should be led through the processing cycle by the software. A menu is presented with a few options to select from and a mask provided through which to make alterations. These M&Ms believe it is best to protect the user from the complexities of the system and protect the system from the klutz at the wheel. It has a place. I would look to this area for the type of handling necessary for, perhaps, TEXTA updates.

(U) Another approach is to provide the user with the modules necessary to manipulate the data, a high-level language to package the modules, and the ability to communicate with other users and peripherals such as high-quality printers: basically, a sort of Procedural Applications Language that is not unique to traffic analysis. Perhaps a Universal Procedural Applications Language approach. The user is free to design personal processes and, more importantly, *change* those processes at will. Users are not dependent upon the programmer for every minor modification, routines do not have to be recompiled after each change, and the results of the changes are immediate. I believe UNIX meets this challenge.

(U) The M&M approach keeps the analyst (or user) dependent upon the programmer for modifications, thus preserving the problem of too much demand being placed on a resource that is already overtaxed. The solution to the demand for software packages has

all too often been the letting of contracting, at considerable expense, to develop processes that a few analysts, skilled in a handler like UNIX, might be able to get along without.

(U) If our own resources were concentrated in a manner conducive to the development of generalized handlers (a Universal Procedural Applications Language), and perhaps a bit of that contract money concentrated into rewarding the good programmers we have left, we might be able to come up with better analysts and better programmers. As a by-product, we might be able to handle the workload with the number of analysts we have and do a better job of it.

(U) So, what was it that set me off this time? A few days ago, while demonstrating a few system capabilities to a potential user, I was walking through the steps of a UNIX shell file (merely a collection of UNIX commands that execute sequentially and perform some process) and he asked me if I "wrote this program." The words startled me. Wrote a "program"? Me? I'm a traffic analyst, I can't "program." My rather bumbling answer was something to the effect that this is really not a program, just a collection of instructions to perform a certain process on this computer. After he left I put the shell on the screen and read it a few times. By gosh, a few years ago I would have called that mess a program myself. It "looks" like a program. It "acts" like a program. And my extemporaneous answer wasn't too bad a definition of a program.

~~(C-CCO)~~ I had to pause and reflect a bit. I put that shell together in about five minutes. What does it do?

[redacted]

Based on past experience in trying to get a process to do a select of this nature, and going through the "channels" to get it, this "quickie" shell seems fairly powerful.

[redacted]

(U) I think I've found a faster horse, I probably couldn't keep up with younger women anyway, and I'd rather have a cold beer than older whiskey, so if anyone knows someone looking for a "programmer," I'll settle for two of four.

Computerizing Traffic Analysis (U)

[redacted] P.L. 86-36

This paper was presented at the November 1982 meeting of CISI.

The traffic analyst finds himself turning to data systems because he often has mountains of data to examine, because the people who receive TA results usually want their information very rapidly, and because almost all the data the traffic analyst wants to see are already inside a computer somewhere.

(U) Most traffic analysts who try to look at data systems develop a kind of schizophrenia. On the one hand, the TA data that come in today have to be processed and analyzed today because there will be another batch of data coming in tomorrow. This means that the traffic analyst has to use today's data system to handle today's data. On the other hand, it does seem to us traffic analysts that data systems people would much rather talk about tomorrow's system – the one that isn't here yet, the one that won't have all these glitches and problems that today's system has.

(U) The traffic analyst who is in the trenches on a current operational problem would easily trade all the glowing promises of some brighter tomorrow for a quick fix on some of the glitches in today's system that will keep him from bleeding to death right now. That isn't my subject today - I really want to talk about the future. But as I thought about standing up here in front of all you data systems people, I couldn't resist putting in a plug for the working traffic analyst; he needs your help, both today *and* tomorrow.

THE PROLOGUE IS PAST

(U) I might be well to begin with a little history, or at least history as I remember it. My first recollection of what we now call data systems was a lot of eighty-column cards and a card sorter. That was about thirty-five years ago. Watching those cards go through that sorter was rather hypnotic. The possibilities seemed limitless then - if we could only find a cheap and easy way to get the data onto the cards. I think the equipment was called Electronic Accounting Machines (EAM), and the people who supported the traffic analysts were called Methods Analysts (in the 1940s and early 50s).

(U) Since our data consisted of a matrix with eighty columns and many rows (one row for each card), our output consisted of that same matrix with its columns and rows transposed in some way. Later, we added the ability to look up words or strings in a dictionary and insert the result back into the matrix.

(U) Many years and computer systems later, in the mid-1960s, this was still the primary data systems support to traffic analysts: a transposed matrix (now often wider

than eighty columns) with a dictionary lookup. There were attempts to go beyond this. Most of the things we tried were made to fit one specific problem and never developed into general TA tools. We developed ponderous, monolithic record formats whose structure provided a special place for each variety of data we thought we would find in the traffic. What I remember most vividly are long, soporific meetings where all we ever seemed to talk about was what *format* the data were going to be in. We spent untold amounts of energy and resources getting all of our data *into* these unyielding, user-murky systems, and there were often little energy and resources left over to develop any user-friendly *output*.

(U) The result of this, in many areas, was that the output received by the traffic analyst was not much more than his original raw traffic, transposed both horizontally and vertically, and with some information added through dictionary lookup processes.

A LONG THIN MATRIX

The form in which the output was delivered to the analyst was often decreed by someone remote from the analyst - someone who never had to actually live with the output - and it was rarely if ever changed to fit the current needs of the local problem or individual analyst.

(U) It is still possible, even today, to see analysts sitting down with computer output and handlogging data from that computer output onto a form for their own personal use. In at least two areas, one might then see that same handwritten log being used a little later to punch cards for further computer processing!

WHAT IS THE TRAFFIC ANALYST TRYING TO DO?

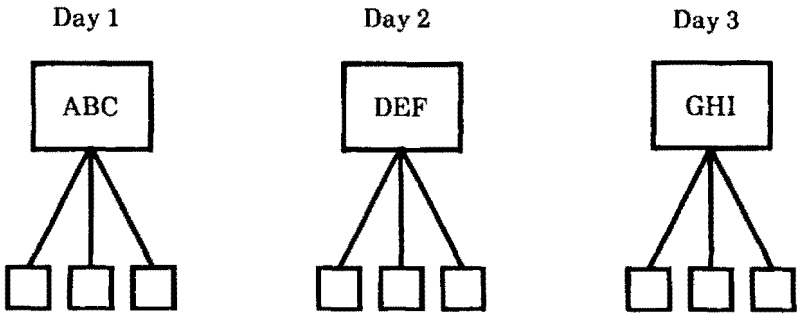
(U) The traffic analyst is trying to draw a picture of his communications target. He usually wants this picture to show how his target looks when it is operating normally. Once he knows what his target's normal behavior is, then he is in a position to detect variations, and report them to intelligence consumers.

CONTINUITY

(U) Traffic analysts are usually looking for something they call continuity. When faced with a target that has daily-changing callsigns, the traffic analyst seeks to learn which of today's callsigns matches what callsign used yesterday.

If I can say that the station that used callsign ABC on the first day is the same station that used callsign DEF on the second, then I can say that DEF (on the 2nd day) is continuity of ABC (on the 1st). On the third day, if I can say that GHI was used by that

same station, then I can add GHI (on day 3) as another link in a growing chain of continuity. Many of our TA targets do change their callsigns, frequencies, addresses, and other features on a regular basis. They do it to make collection and identification more difficult, and it is the job of the traffic analyst to defeat these changes by the development of continuity.



CONTINUITY

Date:	1	2	3	4
STN 1:	ABC	DEF	GHI	...
STN 2:	...	...		
...	...			

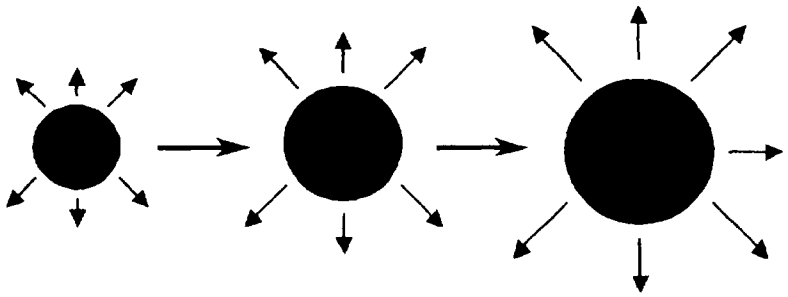
TWO KINDS OF TRAFFIC ANALYSIS

(U) There are two forms of traffic analysis on most problems: development and maintenance. To borrow an example from cryptanalysis, the attack against a cipher system often goes through two phases:

- first, diagnosing and recovering of the general cipher system, and
- second, exploiting and processing the recovered system, which often involves solving daily keys or settings.

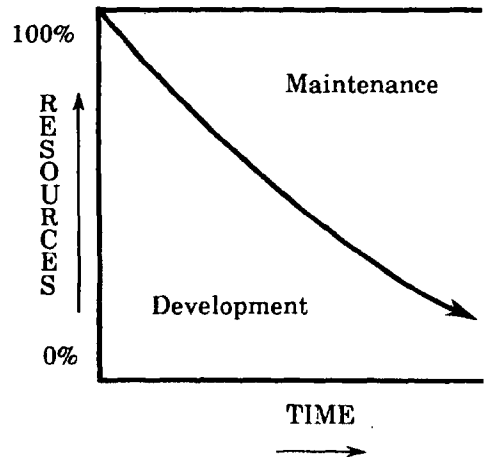
So too, in traffic analysis, one can consider that there is a development (or recovery) phase and a maintenance (or exploitation) phase, which may or may not include product reporting. However, in traffic analysis, the two phases often occur at the same time.

(U) In some ways, the traffic analysis process resembles a spreading oil blot. Out on the edges, new target territory is being conquered; new target communications structures are being discovered and cataloged; new methods of identifying and distinguishing various communications are being developed. But back in the central part of the oil blot, the territories previously conquered must be kept track of; the continuity of target communications structures previously recovered must be maintained.



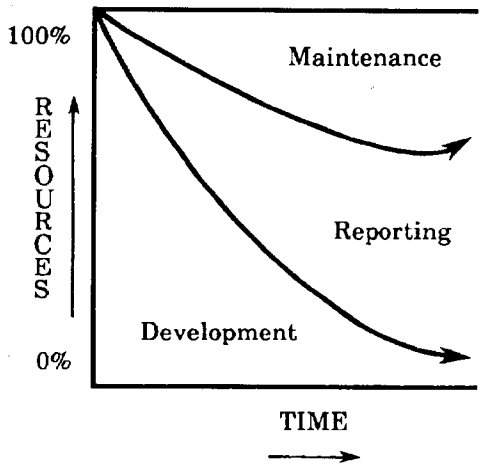
Recovery – outer edges
Maintenance – center

Oil Blot



(U) The more territory one conquers, the thinner the center of the oil blot becomes. The more communications structures one recovers, the more continuities there are that now must be kept track of. As the maintenance effort grows, it will use more of the available resources, draining them away from the recovery part of the effort, and at some point it will have absorbed enough of the resources so that a point of "no growth" is reached and, for all practical purposes, recovery of new structures stops. If expansion doesn't stop, the center of the oil blot will break; if development doesn't stop, the maintenance effort will fall behind and begin to lose track of continuities, which will then have to be discovered and developed all over again. This tension over resources between maintenance and development is similar to the one between software maintenance and software development.

(U) Sometimes the personality of the manager plays a part in just where this point of "no growth" takes place. Some managers are more at home in the settled, stable atmosphere of the center, where things don't change much from day to day. These



managers tend to concentrate their attention on building a smooth-running system at the center, and may put a larger proportion of their resources into that area, so that the "no growth" point is reached more quickly. Other managers thrive in the rough and tumble frontier atmosphere out on the edges of the problem, where each day is likely to bring some new and different challenge. These managers tend to concentrate their attention on the recovery effort, sometimes at the expense of the more humdrum maintenance.

REPORTING

(U) Some traffic analysis problems have a lot of potential for reporting - for providing the intelligence consumer with a blow-by-blow account of what the target is going. Targets that involve ships and aircraft often have this potential because they move around from place to place, and the analysts often find much of their time taken up with reporting which ships and aircraft were active today, in what areas and performing what missions. Where this reporting potential is high, it tends to draw off resources from both development and maintenance. Managers whose problems have a strong reporting emphasis (especially time-sensitive reporting) will generally try to pull resources from development rather than from maintenance, because losing the continuities means losing the raw material for the reporting effort. Losing the development effort is generally seen as the lesser of two evils.

(U) As an aside, I should say here that the reporting side of traffic analysis is generally well ahead of the technical side in the use of computers. Since my primary interest in this paper is the working-level traffic analyst, I will be concentrating on the technical side, and I do not propose to discuss the reporting aspects of TA except as they touch on the technical side.

(U) From the standpoint of the two kinds of traffic analysis - development and maintenance - we can express the general goals in the following ways:

TA DEVELOPMENT GOALS

(U) We rarely collect or analyze all of the communications of any given target. We are almost always working on a sample of the target. At any given time, there is some residue of the target that we do not maintain continuity on, and bits and pieces of that residue find their way into our unidentified or search pile - the file of incoming traffic that looks as if it belongs to our target but doesn't exactly fit any of our known continuities. Development TA concentrates on that pile, trying to dig out new target nets and continuities. This unidentified pile is almost like "background noise": it is always there, whether we talk about it or not. If we are still growing (if the oil blot is still expanding), then our development goal is to dig more of the target out of the unidentified pile. If we have reached the "no growth" point, then our development goal is to be able to recognize and develop any new communications that the target might put on the air - communications that ought to stand out against the "normal noise" in the unidentified pile.

TA MAINTENANCE GOALS

(U) During the maintenance phase, we want to be able to hang on to the continuity that we have already recovered. We want to do this

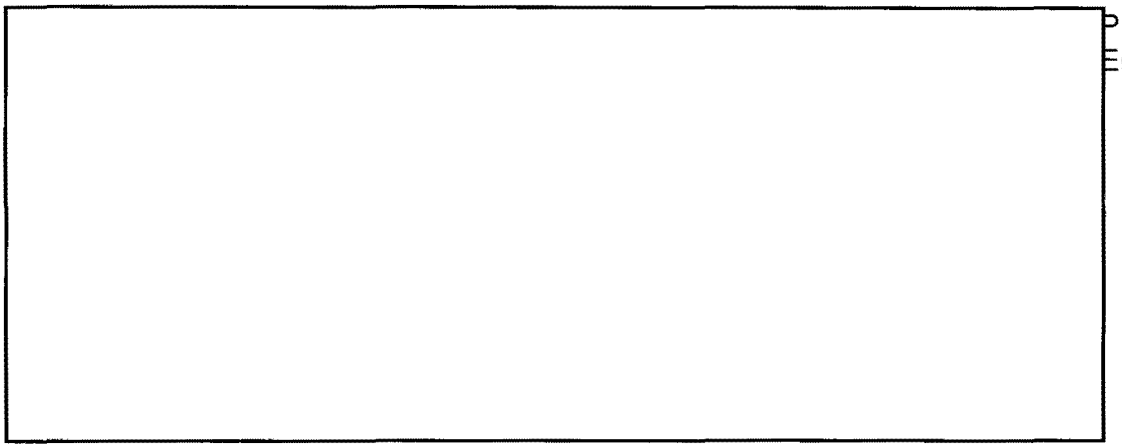
- to support whatever analysis efforts are currently engaged on the target (such as cryptanalysis, language, reporting, etc.), and
- to support whatever collection effort is working against the target.

(U) To do the first support requirement properly, we need to be able to correctly distinguish and identify each of our continuities as the traffic arrives at the point of analysis, i.e., *after* it has been collected. However, to do the second support requirement properly, we need to be able to tell the collector *before* he collects the target, what the target is going to look like and what the target is likely to do. If we can tell the collector what callsigns the target will use, what frequency he will use, what time of the day he will come up, and what he is likely to do when he does come up, then we have satisfied our goals for maintenance traffic analysis. On some problems, we are fortunate in being able to do this on a regular basis. On others, we spend the first few hours of the day (or callsign period) scurrying about to recover new keys and then, for the remainder of the day (or period), we can project what the collector will encounter in the way of callsigns, etc.

HOW CAN COMPUTER POWER BE APPLIED TO THE TA PROBLEM?

~~(S-CCO)~~ In order to consider how the power of the modern computer might be applied to traffic analysis, we need to look at the model of TA that emerges from these two phases: development TA and maintenance TA. Although I have described them as if they were distinct and separate, they really ought to be thought of as a conjugate pair, because they tend to occur together on most problems. It is also possible for certain problems to be best

described as a hybrid of these two forms: during the war in Vietnam, one out of every three pieces of intercepted traffic was unidentified, largely because of the rapidly changing nature of the target. The point I want to leave with you today is that any attempt to provide the traffic analyst, either here in this building or anywhere in the world, with a Traffic Analysis Workbench System must reckon with the fact that the problem he is working will always be some mixture of these two forms of traffic analysis. We also need to consider that a TA problem can quickly change from one form to the other.



P.L. 86-36
E.O. 1.4.(c)

~~(C)~~ We decided to see if we couldn't find a way for computers to help us with the more stable maintenance problem. I remember spending several weeks laying out the logic and processes on the problem. And I remember being told, at the end of the project, that there wasn't nearly enough memory available to do what I needed.

	MAINTENANCE	DEVELOPMENT
Problem type:	slowly changing	rapidly changing
	bookkeeping	pattern searching
	"Anything changed?"	What's new?"
How dynamic?	slowly changing	rapidly changing
Foreknowledge:	high	low
State of solution	solved	unsolved
Control:	semiautomatic	hands-on
Interaction:	human-efficient	human-intensive
Techniques:	target specific	human specific
	knowledge-based?	"mix-n-match"
Worst case:	"below the salt"	start from scratch

A COMPARISON OF TWO FORMS OF TA

(U) Let's look at these two forms of TA a little more closely. How do they compare when we look at them from the viewpoint of providing today's (and tomorrow's) traffic

analyst with a computer support tool kit, while using a terminal workstation in an NSA worldwide networking environment?

(U) In development TA (the garrison communications in our example), we have a bookkeeping problem,

- where the emphasis is clearly on keeping track of a lot of known continuities;
- where we expect the changes in the target characteristics to be relatively modest;
- where the technical means of keeping up with the target (i.e., callsign and frequency systems, address tables, etc.) are largely solved or understood; and
- where we have good prospects of being able to project the appearance and behavior of the target from day to day.

(U) In development TA (the training communications in our example), we have a pattern-searching problem,

- where the emphasis is on sifting through masses of low-yield ore, looking for something that forms a continuity;
- where the next success may look nothing like the last one; and
- where the chances of finding that needle in the haystack may depend as much on the personality of the searcher as on the content of the haystack.

If we can't *keep* continuities (i.e., are not *able* to), then the target stays in the development phase, no matter how much we know about it. Someone once said that TA continuities take either 95 percent of our resources or 5 percent. That number may not be right, but the idea is. Being able to keep track of the continuities is the key to whether the problem is development or maintenance in nature. A daily-changing callsign system *looks* to us as if it is rapidly changing if we haven't solved the system, but once the system is solved, we then perceive it to be slowly changing. It is a matter of viewpoint.

(U) In maintenance TA, we work largely with what the target gives us. A package of techniques to grapple with a callsign system may work well enough on a problem where the callsigns are the key to our keeping track of continuity, but may be almost useless on another problem where the callsign system isn't solved and we must rely on other things, such as serial numbers or addresses.

(U) In development TA, on the other hand, a particular technique may pull one new structure out of the search pile and then never again find anything. The development analyst may need to continually devise new attacks and new methods; to him, the search pile is a featureless mass, and it is his job to sort out the various pieces and find ways to distinguish one piece from another with some reliability.

(U) The maintenance TA problem probably needs a package that will

- look over the incoming material for the day;

- make reasonable guesses about continuities (including garbles);
- flash a warning light at the traffic analyst when things look *very* wrong or when it is confused by something; and
- provide a clean and readable summary of its results to the analyst for review.

It ought to keep up with both short-term and long-term trends, and should be especially attentive about "missing persons," portions of the target which haven't been seen for a while.

(U) The development TA problem, on the other hand, needs a tool kit that will provide the analyst with a range of diagnostic, computational, and pattern-searching techniques that can be brought to bear on the problem, in whatever mix the analyst needs at the moment.

WORST CASE

(U) I have shown what might be called the "worst case" for each of these forms of traffic analysis.

(U) In maintenance TA, one sometimes finds that a problem must somehow be worked, but that it has no real resources and not enough clout to get any. Now, in the best of all worlds, where everything is done right and for the right reasons, such problems should not exist. If a problem is worth working on at all, it is worth the resources needed to get the job done. However, in the real world, those problems that are "below the salt" will be working with whatever support they can beg, borrow, or scrounge. Proving a general package for such problems would pay for itself a hundredfold in the first few years. At the minimum, the package needs to be able to "ring an alarm bell" when the target starts to disappear, or becomes more active, or changes in some other way.

~~(S-CCO)~~ In development TA, the worst case might be the situation where nothing is known. That is not as uncommon as some people might think. [redacted] P.L. 86-36 E.O. 1.4.(c)(c) When we pull together an analysis effort for a sudden war or brushfire, the analysts are usually drawn from other problems around the building; it would be nice if they didn't have to add "learning a new system" to all the other problems they will face on the new target. Therefore, the tool kit for such situations must be quite general and all-purpose.

TWO SYSTEMS OR ONE?

(U) What I have been describing so far may sound like two different systems, but what I am proposing is one system, with two parts. I have already said that these two phases or aspects of TA occur together, and I should add that on more than one problem, they are frequently done by the same people. New continuities are recovered by the development

TA process, and then handed over to the maintenance TA effort to be kept track of. Information is often derived by the maintenance effort that will help the development effort. What the traffic analyst needs is one system that has enough flexibility for him to move whichever way his TA problem takes him. It would also be useful if the language we use is one that isn't going to change every few years because some equipment in the basement is being upgraded.

PINSETTER

(U) Several years ago, we began to work on the concept of a Traffic Analysis Workbench System, with the covername PINSETTER. Some of what I have described here comes out of that experience. PINSETTER has been described elsewhere, so I will not spend time on it here. However, I will share with you some of my personal conclusions about PINSETTER, especially those which seem to be pertinent to the future.

(U) There are aspects of traffic analysis that resemble word processing, and a good screen editor seems to go a long way toward putting the analyst in contact with his traffic, letting him rearrange it and touch up the rough edges and garbles the way he (the owner) wants them. It lets him look at the data *before* he decides what processing to apply to them. It also puts him in a good position to generate reports about his problem, especially the technical reports with technical data embedded in narrative text.

(U) A good tool kit, similar to UNIX and the PINSETTER extensions, is invaluable in providing the traffic analyst with the ability to tailor-make his own flexible processes for large scale manipulation of his traffic.

(U) Many of the practical results of PINSETTER results that found their way into daily applications on specific targets were not limited to traffic analysis. It became a regular occurrence to hear people from other cryptologic disciplines tell us that much of the UNIX/PINSETTER package for traffic analysts was what they needed, too.

PROBLEMS THAT NEED SOLVING

(U) Among the many problems that need to be solved, I would like to mention two. Both of these are areas that are critical to the future TA Workbench System.

ARCHIVES

(U) Some of our continuities form chains that stretch back to the end of World War II. One of the things that data systems people don't like to hear is that we need storage for data whose lifetime must be measured in years, and perhaps decades. Some years ago, there came a time when all of our incoming data went solely into the computers in the basement. It was the culmination of the dreams of a number of people: to take the raw traffic away from the analyst! I don't challenge that decision. It is history. But I must say

that on many TA problems around the Agency, there are no good records on our *known continuities* from that date forward, unless there were analysts still keeping some sort of hand records. The philosophy on most computer hosts is that any records not accessed within some period (usually a year or less) are taken off the system.

(U) Even if the data are put onto tape, the medium will deteriorate. Once on tape, the data are "out of sight and out of mind." The software understands that data will sooner or later disappear or be "improved." Nevertheless, the analysts on that problem are still responsible for that period of time, and may still have to field questions about their targets for that time period. So far, we have dodged this bullet, but sooner or later we will have to face the need for long-term archives.

INFREQUENT USE OF PROCESSES

(U) The second problem involves the question of software that is only infrequently used. For example, suppose that one of our larger targets has a major communications change every five or six years. The effect of this change is so great that it interrupts intelligence reporting on that target until the new communications structures are understood and recovered. Each time the change occurs, an intensive effort is therefore mounted to recover our continuities in the shortest possible time.

(U) In the old days, when the special effort was over, everything was bundled up and packed away for retrieval when the next change came along. But how do we handle this now that we have modern data systems support? After five or six years, how much of the software is still useful? Chances are that the database has been changed, as well as the host on which it resides.

(U) Another example might be the diagnostic techniques to attack a particular kind of callsign system. Once the system in question is solved, how should we preserve the software so that it doesn't need to be reinvented the next time such a system is encountered? Suppose we don't find a similar system for five, or six, or even ten years?

CONCLUSION

(U) I don't offer either my observations or my experiences as criticisms, but rather as areas of traffic analysis support which need to be solved. I have tried to avoid mentioning specific hardware or software, except as examples. A man named Bob Biles taught me long ago that users should never tell computer people what equipment to use.

(U) Perhaps traffic analysis has lagged behind other cryptologic disciplines in making full use of modern data systems. But that is changing, thanks to the patience, ingenuity, and hard work of many of you here today. I still keep a supply of pencils around, and I still have a pencil sharpener on my desk - but I have noticed that I don't really use them very much anymore.

Traffic Analysis: Specialty Without Portfolio

[redacted]

P.L. 86-36

Editor's Note: This is an address given by [redacted] the A2 Senior Analyst, at the 1980 symposium of the Communications Analysis Association; it is based on his extensive experience on the Soviet military problem.

In addition to cryptanalysis, which I do not intend to deal with in this discussion, communications intelligence has always involved two primary, overlapping but distinct, tasks with respect to target analysis:

- ordering and understanding target communications structure and procedures– commonly referred to as *traffic analysis*, and
- describing target organizations, activities, intentions and trends – known as *intelligence analysis* or *special research analysis*.

The major overlaps of the two disciplines are in their contribution to target organization, or order of battle, and command and control.

Of these two skills, only the latter one, intelligence analysis, has been effectively accommodated in the NSA career structure. Traffic analysis, in terms of its application, is largely regarded as a skill to employ if time and resources permit, which means that it is basically nonfunctioning in many important areas. In career terms, it has been essentially inaccessible to representative numbers of people, being an apprentice slot that must be abdicated by those with more than modest ambitions.

The Future of Traffic Analysis

P.L. 86-36

[redacted]

It is a pleasure to be here and to be asked to think about the future of TA. That's a subject I've been thinking about, in one way or another, for most of my adult life.

I would like to begin by making some predictions about TA twenty years from today. I found a crystal ball and was going to set it up here on the podium for these predictions. However, the guy that owned it couldn't figure out why I wanted it, so I decided it wasn't worth the trouble.

Here are the predictions.

- *Twenty years from today, people outside the field will be telling us that TA has no future.*

Back in 1946 when I first started, people were quick to tell me that TA was a wartime skill, that it did a fair job during the war, but that it wouldn't be around very long in peacetime. In fact, I can remember not really wanting to be in the field of TA. I was convinced that CA was more interesting, and for a while I did my best to get out of TA so I could work in CA. (Later on, when I got my hands on some actual raw traffic and began to work with collectors, I found that TA was a lot more interesting than I thought.) And people have been predicting the demise of TA ever since. By now it's an old song, but I even hear it today. So it doesn't take much nerve to predict that we will still be hearing that song twenty years down the road.

- *The highest graded individual in the TA field will be a supergrade, or whatever they are calling them twenty years from now.*

This is another easy prediction. [redacted] got to be a supergrade as a Traffic Analyst, and so did I. I see no reason why other Traffic Analysts can't do the same. If anything, it ought to be a little easier for you, because the Agency is now more attentive to the technical track than it has been in times past.

- *Most of the daily front page news in the intelligence community will be provided by TA.*

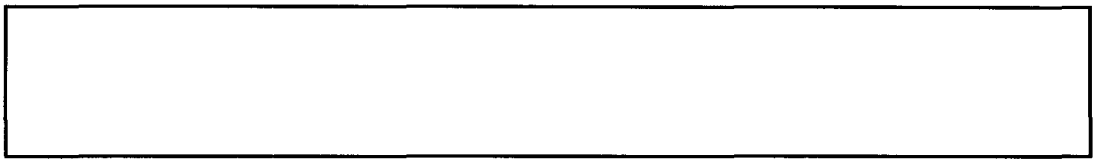
This is another easy one. We do it now. We have been doing it. It seems an easy projection to say that we will continue. We will still be relying on TA for much of our Information [*sic*] & Warning. There may be some new high-tech wrinkles in the I&W world twenty years from now, but TA has a good track record for reliability and consistency in this area. It is so simple for TA to "reach out and touch" targets to see if

~~FOR OFFICIAL USE ONLY~~

they are normal. Even if some good gadgetry comes along, the result will be some sort of partnership between the new techniques and the old reliable methods of TA.

- *We will still rely on TA for collection steerage.*

It is funny how often this is overlooked in day-to-day operations. And yet some TA shops could almost pay their own salaries in the savings from more efficient use of collection resources. Signals are getting more complex. Some of today's targets have a lot of money to spend and are modernizing faster than our collection system. All of this will require even *more* efficiency for collection steerage, and that's where TA has to come in.



FPLL.8866366
EO1144(c)

This hasn't changed for years, and probably won't over the next twenty. TA people are still "batching" traffic into homogeneous groups to prepare it for cryptanalytic attack. Ask your favorite cryppies if they would like this to continue. Once cryptanalysts experience good TA support, they become believers; they will ask for it again and again, because they know it helps them to do their own job well.

- *On Tuesday, the 24th of May, in the year 2005, someone will be heard to say, "My problem isn't a standard TA problem – we don't use callsigns."*

I think I first heard this about thirty-five years ago when I started working on a radioprinter problem. I really don't think there is a *standard* TA problem. What we have is one or two problems that are so large, we tend to think of them as standard. But they aren't. Traffic analysts have a large bag of tools, built up over the years. We keep adding to that bag of tools, but we don't throw old tools away. Lately, we've been added some computer tricks to our tool kit, and over the next twenty years, I suspect that other new tools will be developed. We need every tool we can get.

Art Levenson used to say that we were a bit like a man that has lost his wallet on a very dark street. We don't look for it where we think we lost it – in the dark. We look for it under the street light where we can see. We have to work with what the target gives us. And we use whatever tools are appropriate for the features the target gives us.

This leads me to my last prediction, one I hope does *not* come true:

- *Sometime during the next twenty years, your target, or the target you are most interested in, will have a major communications change.*

Maybe the target will find out what we use to exploit his communications, how we do our little magic tricks to produce TA results. Maybe they will have a spy, or maybe some public figure will slip and say too much, or maybe someone will go out and write another

dumb book. Whatever the reason, the target will change its system, perhaps at great cost and inconvenience.

First there will be panic and lot of running around. Then, after things settle down a bit, the traffic analysts will begin to take a look at what the target is giving us to work with. Then they will dip into that big old bag of TA tools and start building another processing system, a system that will feed the collectors, and the cryptanalysts, and the intelligence community. As they recover the new signal plan, what the traffic analysts find will be new, and maybe some of the tools they use will be new. But it will still be TA.

Valedictory of a Traffic Analyst

JOSEPH STARR

P.L. 86-36

(U) On August 1, 1985, I retired from the National Security Agency after almost forty years of cryptologic work, which included at one time or another most of the things NSA does in the fields of collection, analysis, and SIGINT reporting. I enjoyed every minute of it. I honestly don't believe I could have chosen a more enjoyable or rewarding career. If I had been born rich, I would have done traffic analysis for nothing; if I had been independently wealthy, I would have paid the Agency to let me do it. Hang with me for a few minutes of serious discussion about machine processing problems, and I'll share with you a few observations, comments, and recommendations that may contribute to your enjoyment of the profession and perhaps help you to avoid some of the pitfalls that beset the paths I wandered in.

(U) The most important question confronting the profession today is why, from a traffic analyst's viewpoint, data processing systems have not yet produced the Utopia we were led (or stampeded) to expect back in the early 1960s.

(U) In the January–March 1980 *Cryptolog*, [redacted] correctly sorts working analysts into three categories: loggers, case analysts and research analysts. He then predicts that automated processing techniques will permit us to eliminate the loggers, and assesses that the research analyst is the one with the bright future because he is concerned with the "why of analysis...driven by his desire to explain." But every analyst should be saying why, and George's prediction that the logger will become obsolete just hasn't happened, although it should have. Indeed, we now have a new generation of loggers who have even less understanding of traffic analysis than those who preceded them.

(U) After George discusses how analysts are going to have to adapt in order to be productive in a modern (machine-oriented) world, he puts his finger squarely on the major problem area, "manageable machine systems that will function as designed." And he goes on to point out, ". . . our track record for the development of such systems is not impressive."

(U) In the December 1981 *Cryptolog*, [redacted] published an article on machine processing that everyone who claims to be a traffic analyst should have read. Part of what Dale addressed was the problem with keeping competent programmers on the job, and how the traffic analyst could be freed from total dependence on the programmer.

(U) Traffic analysis is basically a very simple art if you are able to keep your mind loose so that you can recognize and exploit whatever the target gives you to work with. This is a fairly easy exercise intellectually, but it is much more difficult to structure your thought processes in order to design a machine processing system that will give you essentially the same versatility. Unfortunately, we have some managers and analysts who have produced processing systems and tried to make the target fit the processing

P.L. 86-36
EO 1.4.(c)

scheme, and I include in this category most of those procedures that were designed to replace a hand log kept by the analysts with a similar log prepared by the machine. The results were predictable. What we have now are logs prepared by machine that in many instances are inferior to those the analyst prepared by hand. And, without the benefit that accrued from working the traffic by hand, today's analyst has even less understanding of the data and may in fact be at a total loss to explain observed anomalies.

~~(C)~~ We can reverse this trend. We need to build on the good decisions we have made with regard to automating data processing for traffic analysis, and we must be willing to discard the bad decisions. What we really need to do now is to get on with developing an expert system that will process automatically all incoming traffic, compare what is observed to a dictionary of stated norms, and send appropriate alert messages to analysts and reporters on trouble spots.

(U) None of this should be difficult. Building and testing dictionaries will be tedious, but in the process of doing this, the analyst will be compelled to learn a great deal more about his cases than he now knows, and supervisors will be compelled to work with analysts to a much greater extent than is taking place now. When an expert-type system is in place and functional, one of the benefits will be that time will become available for a different and much more meaningful kind of on-the-job training.

~~(S-CCO)~~ We began exploring how to develop an expert system for processing just before I retired. I expect initial development to be slow, painful, and frustrating, but I do expect the system to "function as designed." What we must have to make it work is a sufficiently confident estimate of our analytic judgment and capabilities to tell the machine how to do *all* the dog work for us and then let it do the job. There can be no doubt as to our ability to make the right technical and reporting decisions based on the alert messages because each analyst must understand his responsibilities well enough to have described his case, net, and network norms to his analytic dictionaries.

(U) We will see vastly improved databases as a side benefit of this kind of processing. If the input data aren't good, the expert system is going to make noise; it will not permit any analyst to do a poor job on editing input data without sounding off.

(U) I am not persuaded that an expert system can be developed and implemented by evolution; probably the best (and certainly the quickest) way to effect such radical changes in the way traffic analysis is accomplished would be to select the right analysts and programmers, charge them with developing an expert system to do traffic analysis on a specific target, and set a deadline of perhaps a year hence for the initial job to be finished.

There should be no restrictions as to how the task is to be accomplished, and there should be no arbitrary limitations as to the techniques to be used (e.g., storage of norms for ordinary comparisons should not be made excessively difficult by the intricacies of an existing database).

(U) There is no question that the Agency will develop an expert system at some point in the future, if not for normal traffic analytic functions, then to provide rapid data evaluations for tactical support of military forces. I regret that I will not be here to see it.

(U) Here is the advice I promised earlier.

(U) Learn to be persuasive as well as informative in any presentation you make. The best ideas you have aren't worth much if you can't sell them. You cannot depend on decision makers to steer the right course because it is (or appears to you to be) the logical thing to do.

~~(FOUO)~~ Reporting the results of your analysis is part of your job. Learn what the intelligence requirements are for the target you are assigned and relate them directly and specifically to how you work your traffic. If you don't understand what it is that you are supposed to be getting out of the traffic and don't try to find out, you are still a logger, and that's all you're ever going to be.

(U) Avoid meetings. I am convinced that many people at the Agency really and truly believe that they are making progress as long as they are talking with each other regardless of whether anything is actually being done. I have attended some meetings where the only concrete thing accomplished was an agreement to meet again at some specified date in the future to discuss the same subject. And so help me, they all left happy.

(U) Don't take sinful pride in your own words. If the staff officer who reviews your message or report wants to change your words for his, don't be offended. Staff officers do serve a useful function. If you have treated them with respect in the past, they will often help you get out of trouble.

(U) I finished this article just as my NSA career came to an end. Reading it over, I find a line or two that may be mildly objectionable to one person or another. It was not my intention to offend anyone by my choice of words or by my comments, and if I have given offense, I apologize. This doesn't sound like me, but it does sound nice, and I think I'll leave it right there. Goodbye, good luck, God bless you all.

~~(S-CCO)~~ Upon joining the U.S. Navy (WAVES) in February 1943, Mrs. Filby trained in aerology at Lakehurst Naval Air Station. In the summer of 1944 she was stationed at the Naval Communications Annex (NCA), where she accepted an appointment as a civilian in May 1946 and served as an analyst, translator, reporter, and staff product and technical editor in the weather branch until 1958. This period included a tour with the [redacted] (1953–55). From 1958 until 1964, Mrs. Filby served as an analyst, cryptolinguist, and reporter in Soviet naval and merchant shipping problems. This period included assignment to the Military Cryptanalytics course (taught by Lambros Callimahos), a year-long Advanced Intensive Russian course, and the pilot SIGINT reporting course at the National Cryptologic School (NCS). She was instructor and developer of the NCS SIGINT reporting course (1964–83), organizer of a two-day seminar on SIGINT reporting including Second Parties (1978), and designer of the first SIGINT reporting course for the field (1982). Mrs. Filby was chief of the Intelligence Skills Division, Intelligence and Analysis Department (E4) at the National Cryptologic School (1983–86). She continued teaching and presented the field SIGINT reporting course in [redacted] In 1986 she was assigned as special assistant to the Dean, E4. She studied the status of SIGINT reporting throughout the Agency; developed a course on the National SIGINT Operations Center; and developed and managed seminars on SIGINT Users, Support to Military Operations, and Current Issues in SIGINT Reporting. In July 1991, Mrs. Filby was assigned to the Center for Cryptologic History. She has been president of the Crypto-Linguistic Association (1975-1976) and has received several awards: NCS Teacher of the Year (1970); the Meritorious Civilian Service Award (1972); and the CIA Sherman Kent Award for the most outstanding contribution to the literature of intelligence (first NSA winner, 1983).

A Compendium of Analytic Tradecraft Notes

Foreword by the Deputy Director for Intelligence

The core mission of the CIA's Directorate of Intelligence, which I head, has remained the same despite a decade rocked by profound changes in the world. As the analytical arm of the CIA, we seek to provide the most useful, high-quality analysis to US policymakers, lawmakers, warfighters, law enforcement officers, negotiators, and other officials responsible for protecting US national interests. Our analysis continues to draw from a wide range of sources—from newspapers to the most sensitive technical collection systems.

How we fulfill our mission, however, has changed dramatically. Intelligence analysts are challenged as never before to be creative and proactive in meeting intelligence needs. Long analytic papers largely focused on the Soviet threat worldwide that were the norm 10 years ago have given way to a combination of briefings and short but insightful written and multimedia products covering a broad range of regional and transnational issues.

Now more than ever, new products are tailored to the individual intelligence consumer's concerns. Our analysts put the highest premium on knowing what their consumers need.

The revolution in information technologies has improved our access to sources and our ability to quickly deliver intelligence. But it has also made our work more challenging as we are bombarded with information of varying quality, relevance, and depth.

To meet the challenge of political change and technological advances and take advantage of the opportunities they present, the Directorate of Intelligence has reexamined its core analytic "tradecraft" skills, updating them to reflect how we do our business. The word "tradecraft" comes from our colleagues in the clandestine service, who use it to embody the special skills and methods required to do their business. We have borrowed it to capture our special skills and methods.

We are making the *Compendium of Analytic Tradecraft Notes* available to scholars to shed light on how we support intelligence consumers. This release, although unusual for an intelligence agency, reflects our renewed commitment to reach out to academia and the public, as defined in the Directorate's new Strategic Plan.

Pursuit of expertise in analytic tradecraft is a central element of this plan. Our tradecraft enables analysts to provide "value-added" to consumers of intelligence by ensuring:

- Dedication to objectivity—tough-minded evaluation of information and explicit defense of judgments—which enhances our credibility with consumers dealing with complex and sensitive policy issues.

- Delivery of our products to the right people in time to be useful in their decisionmaking, and using feedback and tasking from them to drive the collection of the basic intelligence that we need to produce our analysis.

Analytic tradecraft skills also serve as "force multipliers," helping us provide top-quality analysis:

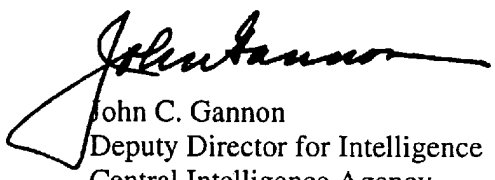
- The feedback our customers give us on our customized analysis clarifies for the analyst what questions most need answering.

- Employing rules for evaluating information and making judgments helps analysts manage the deluge of information, discern trends, and identify attempts at deception.

- Tradecraft standards can be used to iron out differences among experts who have complementary substantive specialties. Their interaction enhances teamwork, which allows the DI to be more productive.

The author of the *Tradecraft Notes* is Jack Davis, a retired CIA officer who has spent 40 years as practitioner, teacher, and critic of intelligence analysis. The *Notes* benefited from the foresight and sharp editorial pen of F. Douglas Whitehouse, Chief of the Directorate's Product Evaluation Staff, during 1994-96. Above all, they reflect the strong commitment to raising analytic standards begun by my predecessor, Douglas E. MacEachin, who served during 1993-95.

Requests for additional copies of *Tradecraft Notes* or copies of the Strategic Plan should be addressed to my Communications Chief, Jon Nowick, on (703) 874-3882. I also welcome your comments on this volume as my colleagues and I work to enhance the way we serve our nation.



John C. Gannon
Deputy Director for Intelligence
Central Intelligence Agency

Summary

Below is a brief characterization of each of the 10 Tradecraft Notes presented in this volume.

Note 1. Addressing US Interests in DI Assessments
PES launched the tradecraft series with a note on the various ways analysts can assure value added for their important clients in the world of policymakers, warfighters, and law enforcement officials:

- One tradecraft tip recommends converting general substantive issues into specific questions that key officials might raise in their preparations to decide on policy action.

- Analysts are encouraged either to organize their assessment around these questions or to make sure in some other way that the operational concerns of policy officials are well covered.

Note 2. Access and Credibility
Demonstrates how the nine evaluation criteria used by PES work together to enhance access to and credibility with the US officials who count most on the analyst's substantive agenda:

- The first challenge is to convince key consumers that the DI assessment is targeted to their concerns. Thus, the importance, for example, of *Addressing US Interests*, providing an *Effective Summary*, and assuring *Effective Use of Unique Intelligence*.

- The second challenge is to maintain credibility in an environment of uncertainty overseas and policy competition in Washington. Thus, the importance of rigorous attention to *Facts and Sourcing* and explicit *Articulation of Assumptions*.

Note 3. Articulation of Assumptions
US officials who must make their policy decisions amidst uncertainty about developments abroad are more likely to rely on DI assessments when the assumptions supporting the analysts' estimative judgments are made clear.

Tradecraft tips cover techniques for:

- Identification, challenge, and defense of *drivers* (key variables) and *linchpins* (assumption about the drivers) before analysts start to draft an assessment.

- Presenting the argumentation in textboxes, for example, when it is not appropriate to belabor the text with details that explicate the critical thinking underlying key judgments.

Note 4. Outlook
The outlook sections of DI assessments must address not only what analysts believe to be the most likely course of developments but also important alternative outcomes that could confront US officials:

- On issues vital to US security such as the military intentions of adversaries, analysts must help policymakers and warfighters engage in contingency planning by addressing alternative courses of developments, including plausible challenges that analysts believe are remote possibilities.

Note 5. Facts and Sourcing
What the analysts know and *how they know it* are central to their credibility not only with policy officials asked to rely on DI assessments for designing and taking action, but also with the managers who are asked to place the Directorate's authority behind the memorandum or briefing.

The two evaluation standards at play here—the handling of facts and of sourcing—were combined in one note that sets out guidelines for analysts and illustrates "best practices" for explicit and tough-minded depiction of information derived from reporting and research. For example:

- Be precise about what is known.

- Distinguish between reported information and analyst judgment.

- Take account of the possibility of deception.

Note 6. Analytic Expertise
Analytic expertise establishes the DI's authority to speak to an issue on which US national security interests are at stake. This note addresses the several facets of analytic expertise and provides tradecraft tips for effectively conveying authority in DI assessments.

The aspects covered include:

- In-depth substantive knowledge that clarifies complex issues.

- Skill in interpreting unique intelligence information.

- Deft organization of data in support of findings and judgments.

- Insight into the decisionmaking processes of US officials.

Note 7. Effective Summary
An effective summary makes the distinctive DI value added stand out for the intended consumers within constricted space limitations. For example:

- When the clients for a DI assessment are few in number and their priority interests regarding the issue at hand are well known, the analyst's job is to craft a summary that presents in a couple of lines of text the *what's new* and the *so what.*

- When an assessment is broadcast to a larger and more diffuse audience, to assure requisite attention, the summary has to convey evidence of the DI's distinctive expertise as well as key findings and judgments.

Note 8. Implementation Analysis
Implementation Analysis is one of the techniques for extending customized intelligence support to policymakers and action takers outlined in Note 1, *Addressing US Interests.* When the DI provides an assessment of tactical alternatives available to the United States for pursuing opportunities and averting dangers, the role of the analyst complements but is distinctive from the role of the policymaker:

Analysts—calling upon their expertise on foreign cultures—identify and evaluate alternatives for implementing objectives.

Policy officials first set the objectives and then make decisions about which tactics to adopt.

Note 9. Conclusions
Analysts must be precise in conveying their level of confidence in the conclusions of a DI assessment; that is, their findings based on organizing, evaluating, and interpreting all-source information:

- When analysts believe they have made their case after a careful scrubbing of ample information, they should state their conclusions boldly (regarding, for example, what has *increased, decreased,* or *taken on a pattern*).

- In contrast, when available information is susceptible to foreign deception operations and other sources of ambiguity, the analysts' reasonable doubts (for example, about *cause-and-effect relationships*) must be shared with the officials who may rely on DI assessments in taking policy action.

Note 10. Tradecraft and Counterintelligence
Guidelines for countering deception efforts to distort analysts' understanding of what is going on abroad build on the advice for rigorous evaluation of information contained in Notes 5 (*Facts and Sourcing*) and 9 (*Conclusions*).

For issues where analysts suspect the presence of deception and for all assessments on which policy officials may directly rely in making decisions on whether to take military or other action to defend US interests, we recommend a structured effort to validate the integrity of key information.

On these *suspect and sensitive issues*, we urge analysts to answer a blunt question:

- *How do you know you are not being deceived?*

Notes on Analytic Tradecraft

Product Evaluation Staff

March 1995

Note 1

Addressing US Interests in DI Assessments

This is the first of a series of Product Evaluation Staff notes to clarify the standards used for evaluating DI assessments and to provide tradecraft tips for putting the standards into practice.

The DI professional ethic requires that analysts provide direct support to policymakers' efforts to define and defend US national security interests. The standard is for DI products to convey distinctive value added that promotes feedback, tasking, and access generally. In many cases, this standard requires going beyond general relevance to US interests to customized assistance for identified policy officials who have the "action" on designing, implementing, or monitoring US policy on an individual issue.

The ultimate judges of the utility of DI products for the policymaking process are the officials who choose whether or not to rely on them. The opportunities for adding distinctive intelligence values are usually clear to DI analysts when policy officials ask for a study, memorandum, or briefing. These officials indicate what they expect to gain from their request: for example, specialized information, research findings, cause-and-effect analysis; cost-benefit assessment of tactical alternatives.

The challenge to address effectively US interests is greater when the initiative for launching a DI product comes largely from the intelligence side of the relationship. It is here that Agency monitors (such as the staffs of the congressional oversight committees) are most likely to raise questions about the policymaking utility of individual DI products.

How to proceed? Each analytic assignment represents a distinctive opportunity for providing support to policy officials and the policymaking process. That said, veteran analysts and managers have garnered from direct experience and feedback from policy officials that DI products are usually best directed to meet the needs of the user when they are either organized around or specifically highlight one or more of the following values:

- Opportunities and dangers for US interests, especially unexpected developments that may require a US reaction.
- Motives, objectives, strengths, and vulnerabilities of adversaries, allies, and other actors.
- Direct and indirect sources of US leverage on foreign players and issues.
- Tactical alternatives for advancing stated US policy goals.

Veteran analysts and managers also recommend the following *Tradecraft Tips* for increasing the utility of DI assessments for policymakers.

Getting Started

- *Think of the analyst's role as that of the objective or tough-minded expert for a policymaking team.* Much of the time, hands-on policy officials know the "story" or general pattern of events overseas regarding their priority accounts. What they need most from the intelligence analyst is organized information, including specialized intelligence, that clarifies the goals and motives as well as the strengths and weaknesses of adversaries, allies, and other foreign players.
- *Recognize that research and reporting are inputs or means to an end.* The output is customized support to help policy officials get their jobs done—usually planning for, taking, or monitoring an action. The goal is to convert substantive expertise into action-support analysis before conveying it to consumers.
- *Put a face as well as a name on the five to 10 policy officials who are the core customers on a country or functional account.* Analysts should study what these officials have written or said on important substantive issues and debrief policy staffers who work for core consumers, as well as anyone on the intelligence side of the river who knows their professional habits. The goal is to learn how key officials absorb information and reach judgments, as well as their current priority interests.

- *Target the policymakers' specific interest in a substantive issue.* To identify lines of analysis that provide value added, analysts should think through what they would want to know *if they were policymakers charged with leveraging an issue.* That done, in drafting an assessment or outlining a briefing, the analysts bring to bear the DI's collective substantive expertise, distinctive collection resources, and rigorous analytic tradecraft.

- *Be aware that consumers' needs may change as the policymaking process evolves.* Policy officials often are receptive to broad analytic treatments when an issue first emerges and they are in their long-range planning or goal-setting phase. But once the lines of US policy are set, their focus shifts to specifics about vulnerabilities, leverage, and other facets of policy implementation.

Special Tradecraft Challenges

- *Support the policymaking process without engaging in policymaking per se.* The "if, then" approach can facilitate close policy support without crossing the line to policy prescription. *If* the US policy goal is to get from A to B, *then* the analysts' research findings, all-source collection, and general expertise indicate the following opportunities for moving forward and dangers to be avoided.

- *Long-shot threats and opportunities.* Policy officials often have a strong interest in low-probability, high-impact dangers and objectives. DI analysis in support of policymaking in these circumstances should provide expert, tough-minded assessments that concentrate, not on *whether* an event is likely, but on *how* and *why* it might come about, including the leverage the United States has for constricting dangers and enhancing opportunities.

- *Pointing is not choosing.* Policy-support analysis at times requires the analyst to identify and clarify the vulnerabilities of adversaries and the sources of US leverage over allies and third parties as well as enemies. The responsibility and risk of choosing what actions to take remains with the policymaker.

- *The timeliness challenge.* When policy officials are engaged in managing day-to-day crises, they will use whatever information is available to them when a decision point comes. Rarely will they wait for intelligence analysis. To provide utility, intelligence updates and other analytic support must be delivered in time to meet decision and action deadlines.

Drafting and Self Review

- *Convert issues into questions.* One way to assure utility for policymakers is to organize an analytic effort around the known or presumed questions of key officials on the account. Whenever appropriate, use the questions as section headings, or otherwise make sure that the sections address the identified operational concerns of hands-on policy officials.

- *Use the "so-what" test.* In reviewing a first draft, analysts should evaluate the sections of the paper from the intended customers' point of view and ask—*so what?* Does the draft address specifically and effectively what key policymakers need to know to get *their* jobs done?

- *Or use the "action-support" test.* As an alternative test of the policy utility of a draft, analysts can list the five or so matters they personally would like to see clarified if they were directly responsible for managing US policy action. Next to each entry, list the paragraphs of the draft that provide *actionable* information or insight. Adjust the draft if key identified concerns are not addressed or if too many of the paragraphs are not directly related to specific concerns.

Directorate of Intelligence

Notes on Analytic Tradecraft

Product Evaluation Staff

April 1995

Note 2

Access and Credibility

This is the second in a series of Product Evaluation Staff notes to clarify the standards used for evaluating DI assessments and to provide tradecraft tips for putting the standards into practice.

The goal of enhancing the policy utility and analytic quality of DI papers and briefings is centered on efforts to promote analysts' access to and credibility with the US officials who count most in policymaking, warfighting, and law enforcement:

- The quest for access—and with it guidance, tasking, and feedback—is driven by the DI's determination to produce analysis for people, not publications.

- Commitment to credibility reflects the core professional value of presenting objective analysis to officials who often have a range of conflicting information and views on complex issues.

The two standards are complementary. Without credibility, analysts will lose their access to the hands-on policy and operational officials who need sound and reliable intelligence analysis to succeed in their professional missions. Without access, even unquestionably objective assessments do little to promote the effective use of intelligence by consumers.

As indicated below, the nine standards the Product Evaluation Staff uses to evaluate DI analytic performance reflect the importance of increasing access and protecting credibility:

- The first challenge for analysts is to make clear to key officials *what's in it for them* when asked to commit their most precious commodity—their time—to read or listen to a DI assessment. Thus, the need for analysts to address US interests effectively, provide value added via substantive expertise and special information, and summarize key points efficiently.

- The second challenge is to help key officials succeed in promoting US objectives by producing assessments that can be relied on for sound treatment of evidence, inference, and judgment.

Increasing Access

Addressing US Interests. The most important and demanding charge given to DI analysts is to assist US officials to fulfill their obligation to design, implement, and monitor national security policy. The highest standard is to structure DI assessments to underscore what officials need to know to get their jobs done (for example, about vulnerabilities and strengths of adversaries). When this is not practical, DI deliverables should contain a carefully crafted section that addresses implications, dangers, and opportunities with the role of US policymakers, warfighters, and law enforcement officials as *action officers* clearly in mind.

Sophistication of the Analysis/Depth of Research. Especially in broadly distributed and fully developed assessments, analysts have to convey their distinctive expertise on an issue. This demonstration of authority to speak to the issue should be based on some combination of research methodology, firsthand knowledge of country or subject, all-source data bases, closeness to collectors, and clear articulation of facts and assumptions—attributes that make a busy policymaker want to come back to the analyst for additional information and analysis.

Unique Intelligence Information. Especially in quick turnaround deliverables for small numbers of key officials, the analyst should make appropriate use of unique, at times highly classified, information that provides insights not otherwise available to well-informed officials. Policymakers and warfighters who have the action on key issues almost always have the clearances as well. At times they need assistance, however, in understanding the context and character of intelligence from clandestine collection and other special sources.

Effective Summary. The analyst's charge is to convey the distinctive values of the paper in the prescribed space. To maximize service to heavily engaged officials, the most important findings and judgments should be highlighted within a bare-bones depiction of the general context. Even more than in the main text, the summary should be made "actionable" via emphasis on US policy implications.

Maintaining Credibility

The Facts—Or What We Know. With emphasis on what is new, different, attention-worthy, a DI assessment should set out what the Directorate knows with sufficient confidence to warrant reliance by policymakers and warfighters in planning and executing US courses of action. When relevant, DI deliverables should also address what analysts do not know that could have significant consequences for the issue under consideration. If the paper notes intelligence gaps, it should, when appropriate, suggest collection strategies to fill the gaps.

Sources of the Facts—How We Know It. DI assessments have to depict the sources of information on which consumers are asked to rely within the general rules for using evidence. Direct evidence (for example, imagery and most intercepts) should be distinguished from testimonial evidence (for example, most clandestine and embassy reporting). On complex matters (for example, the attitudes and plans of foreign leaders) analysts should make explicit their levels of confidence in the evidence.

Conclusions. Assessments should enunciate the conclusory findings from the hard evidence (for example, well-documented events) in terms of trends, patterns, and precedents that underscore dangers or opportunities for US policymakers, warfighters, and law enforcement officials. When appropriate, the calculus that leads to the extension of the factual base to an actionable finding should be spelled out (for example, rules used to establish degrees of risk in dual-purpose technological transfers).

Clear Articulation of Assumptions. When analysts address uncertainty—matters that require interpretations and estimates that go well beyond the hard evidence—their argumentation must clarify the premises, suppositions, and other elements of critical thinking that underlie the judgments. For example, effective argumentation for consumers, who will often have their own strong opinions, requires the analyst to clarify not only degree of confidence in key assumptions but also the criticality of the latter to bottom-line judgments.

Outlook. The outlook sections of estimative assessments (for example, the likely course and impact of political, economic, and military developments in foreign countries) should identify the dynamics that will have the greatest impact on subsequent developments. In other words, what are the drivers that will determine the outcome, or what drivers would have to change to alter the outcome?

- The analyst's judgment on the most likely outcomes must follow clearly from the marshaling of evidence and articulation of assumptions.

- When the US stake is high and plausible alternative outcomes are judged to be in the range of, say, 20 percent or greater, outlook sections should also identify the factors at play that could lead to unexpected developments, signposts of change, and events that could trigger a major shift in direction (for example, assassination of a leader).

- On issues vital to US security (for example, military intentions of adversaries), analysts must help policymakers and warfighters engage in contingency planning by (1) addressing all factors at play that could influence subsequent events, (2) ranking their relative importance, and (3) relating them to a range of plausible outcomes, including alternatives analysts deem to be remote possibilities.

Note 3

Articulation of Assumptions

This is the third in a series of Product Evaluation Staff notes to clarify the standards used for evaluating DI assessments and to provide tradecraft tips for putting the standards into practice.

DI analysts are regularly tasked to assist policymakers, warfighters, and law enforcement officers in *managing the uncertainty* that complicates US efforts to deal with national security threats and opportunities. Many issues cannot be addressed with certainty—by analysts, by policy officials, or even by the foreign players involved. The pattern of political and economic developments in, say, a newly democratic country can depend on so many actors, institutional variables, and contingencies that the outlook cannot be predicted with high confidence. Estimating over an extended timeline or during a period of political or economic crisis increases the burden of uncertainty.

As a rule, the greater the degree of uncertainty attending an issue:

- The greater the analysts' reliance on judgment rather than evidence; thus the greater the likelihood of estimative error.
- The larger the prospect for divergent views about the outlook among analysts and concerned policy officials.
- The greater the need for sound reasoning and precise argumentation to align facts, assumptions, and judgments.

This tradecraft note on *Articulation of Assumptions* and the next note on *Outlook* will address the DI tradecraft for argumentation that sets the standard for helping consumers deal effectively with the uncertainty they face in planning for, taking, and monitoring US action.

By "argumentation" we mean the communication in an intelligence assessment of the structure of the analysts' critical thinking in support of the bottom-line judgments. Under the DI tradecraft standard, when policymakers, warfighters, and law enforcement officials are asked to rely on DI analysis, the reasoning that ties evidence, to assumption, to judgments must be:

- *Logical*—soundly reasoned.

- *Precise*—clearly stated.

- *Realistic*—attuned to the hazards of forecasting error.

Drivers and Linchpins

The DI tradecraft for the articulation of assumptions places emphasis on identifying the *drivers* or key variables—the uncertain factors that analysts judge most likely to determine the outcome of a complex situation. At times the economy is the key uncertain factor; at times the loyalty of the security forces; at times the leadership skills of a president or dictator. At times all three are judged to carry equal weight in driving future developments.

The analysts' working assumptions about the drivers are sometimes referred to as *linchpin assumptions* because these are the premises that hold the argument together and warrant the validity of the conclusion.

The following are hypothetical examples to illustrate the relationships of drivers, linchpin assumptions, and conclusions:

- The loyalty of the military is the key factor in determining Egyptian stability in the short term. The military probably will continue supporting the government. Therefore, the government is unlikely to be seriously threatened by opposition forces over the next year.

- Castro's skill in handling recurring antiregime incidents will largely determine the Cuban regime's staying power over the next several months. He probably will continue to diffuse antiregime pressures with a mix of carrots and sticks. Thus, a serious threat to regime stability is unlikely.

Linchpin assumptions are by definition debatable and subject to error. Thus, analysts must defend their judgments by marshaling supporting evidence and reasoning. For instance, in the Egyptian example, the analysts should offer convincing evidence for the assumption that "the military probably will continue supporting the government."

Moreover, on an important issue such as this, the inherent uncertainty has to be accounted for by addressing plausible alternative courses of development, a topic that will be covered in the Tradecraft Note on "Outlook." Here we present recommendations for refining and articulating the assumptions that support the analysts' bottom-line conclusions.

Tradecraft Tips

1. Each assessment represents a distinctive challenge in terms of how to set out the argumentation. As a rule of thumb, the more complex and controversial the issue, the more the analysts should make clear the sinews of the reasoning:

- For some papers, the assumptions can be adequately articulated in the course of the text.
- For others, a textbox may be needed to clarify the causal relationships.
- At times, the entire assessment should be organized to march step-by-step through the critical thinking.

2. Before starting to draft an assessment, analysts should open up the search for drivers, and not rely solely on what was determined to be the key factors in the last exercise. That is, they should put aside their previous conclusions and focus initially on the range and alignment of assumptions:

- For example, generate a list of all the important variables—factors that cannot be known with certainty that are palpably affecting the issue under study.
- Assess the relationships among these variables—search for hierarchies of importance and other linkages.
- At times, with the help of colleagues acting as *devil's advocates*, construct competing cases for selecting the drivers from among the host of variables.
- A useful question to ask to isolate the key variables is: *What factors would have to change to change your mind about the expected outcome?*

3. Also, analysts should open up the process of determining assumptions about the drivers:

- Before settling on the linchpin assumptions that will serve to underwrite the conclusions, assess the quality of the evidence. One test: How likely is new information to change your judgment of what is probable?
- Again with the help of colleagues, test the soundness of the supporting line of reasoning (the articulation of subordinate assumptions) that leads to the linchpin assumptions:

  —In the Egyptian example, the subordinate assumptions to the linchpin assumption that the military probably will continue to support the government could include judgments about the military's stake in secular government and antagonism toward the Islamic extremists.

- Also test key assumptions against any contrary judgments held by other informed observers. What hard evidence and inferential reasoning, for example, lead them to alternative interpretations?

4. Analysts should review their first draft against a tough standard:

- Could a consumer who was not reading all the traffic quickly identify and summarize the essential elements of the assessment's reasoning?

5. Some specific questions analysts should ask about the draft:

- Does the depicted hard evidence adequately explain the linchpin assumptions?

- Do the assumptions in turn adequately defend the bottom-line conclusions?

In Sum

DI analysts can speak with authority on substantively complex and politically controversial issues only through sound and precise argumentation. The more effectively drivers and assumptions are identified and defended, the greater the credibility of the bottom-line conclusions.

Note 4

Outlook

This is the fourth in a series of Product Evaluation Staff notes to clarify the standards used for evaluating DI assessments and to provide tradecraft tips for putting the standards into practice.

This Note on *Outlook* continues coverage of DI standards for helping policymakers, warfighters, and law enforcers manage uncertainty regarding threats to and opportunities for US security interests. (Please see Note 3, *Articulation of Assumptions.)*

The outlook sections of DI assessments must address not only what analysts believe to be the most likely course of development but also important alternative outcomes that could confront US officials. *This concern for the unlikely or unexpected* reflects an experience-based appreciation of (1) the fallibility of analytic judgment, (2) the special analytic requirements of US officials for addressing long-shot threats and opportunities, and (3) the adversarial character of the policymaking process.

The perils of analytic judgment include:

- Limitations in the evidence and in the analysts' understanding of complex issues that can lead to judgments structured around either the wrong drivers (key variables) or incorrect linchpin assumptions.

- The impact of essentially unpredictable events on sound analytic judgments; for example, changes in political stability caused by assassination of a president or the sudden advent of a charismatic opposition leader.

Policymakers and other consumers who carry the burden of executing US policy often have a different attitude than analysts toward unlikely events.

- Officials who are charged with advancing a long-shot objective may probably see a 20 percent likelihood of success as promising opening odds for arranging a negotiated settlement of a longstanding civil war or diverting an entrenched nuclear weapons program.

- Officials also require an understanding of unlikely developments to prepare contingency plans against low-probability, high-impact dangers (such as protecting Persian Gulf oil suppliers from another Iraqi military attack on Kuwait or an Iranian blockade of the Straits of Hormuz).

Finally, the outlook on important issues can be subject to deep-seated disagreements—among and between analysts, Administration officials, and congressmen—that generate suspicions about the objectivity of DI memoranda and briefings.

- At such times, DI credibility can depend more on explanation of why the outlook—for example, for Cuba after Castro or for Russia after the next election—cannot be predicted with high confidence than in an attempt to trivialize uncertainty by "just making the call."

General Rules

As indicated in previous Tradecraft Notes, each DI assessment represents a distinctive challenge to analysts on how to assure credibility with the consumers who count most in planning and executing US policy. The general rules that follow should weigh heavily as analysts choose the most appropriate approach.

1. In all cases, the analysts' judgment on the most likely outcomes must follow clearly from the marshaling of evidence and articulation of assumptions.

- The more complex and controversial the issue, the more analytic effort is required to ensure that drivers and linchpin assumptions are precisely stated and well defended.

2. When the US stake is high (for example, political stability of an important ally or adversary) and plausible alternative outcomes are judged to be in the range of for instance, 20 percent or greater, the outlook section should also structure these potentially important outcomes. Policymakers and other consumers should get enough understanding of these alternatives to decide whether to review contingency plans, ask for more evidence, or levy additional tasks on analysts.

Analysts should identify:

- *The factors at play that could lead to unexpected developments.* What alternative key variables could *drive* the outcome in a different direction (perhaps the economy, or growing corruption)? Or what plausible reversal of linchpin assumptions about correctly defined drivers could turn things around (perhaps the Egyptian military *will not* remain loyal to the Mubarak government)?

- *Signposts or indicators of change.* What intermediate developments would indicate that events may not be working out as originally expected? For example, such negative signposts for regime stability as the advent of coup plotting or capital flight.

- *Events that could trigger a major shift in direction.* What essentially unpredictable events could precipitate the unexpected outcome? For example, a crop failure, or a mishandled natural disaster, or anti-government demonstrations that get out of control.

3. On issues vital to US security (for example, military intentions of adversaries), analysts must help policymakers and warfighters engage in contingency planning by:

- Addressing all important factors at play that could influence subsequent events.

- Ranking their relative importance.

- Relating them to a range of plausible outcomes, including alternatives analysts deem to be remote possibilities against which policy planners may nonetheless decide to deploy resources.

Tradecraft Tips

1. Analysts should avoid unrealistic precision in citing odds. Weather forecasters may have sufficient data to determine that the chances of rain *are slightly better than even.* Analysts rarely have such luxury in assessing the political or economic outlook.

2. Also avoid phrases that compound unavoidable uncertainty with unnecessary confusion: for example, *real possibility, good chance.*

3. As a rule, use constructions that tie the outcome to the driver and linchpin assumptions, rather than flat predictions.

- *Castro is unlikely to be forced out of office over the next six months unless his security forces mishandle disturbances and trigger prolonged violent riots.*

4. To minimize misinterpretation when making important judgments, combine probabilistic phrases and rough numerical odds.

- *On balance, Castro is unlikely to be forced from office in the next six months (less than a one-in-five chance).*

5. To understand the often intense concern of hands-on policy officials about a 20 percent likelihood of a disastrous turn of events happening on their watch, analysts should consider whether they would voluntarily get on an airplane that had a one-in-five chance of crashing.

6. To deal rigorously with unlikely developments, analysts should switch their focus from *whether* something will happen to *how* it could happen. Some techniques for generating credible alternative scenarios by structuring the available evidence differently:

- *Who and What Counts.* Generate lists of the key individual and group players that can determine the outcome of an issue (for example, whether Egyptian politics will continue to simmer or will explode), and critically examine the factors most likely to determine their behavior (such as institutional loyalties, personal rivalries, family interests).

- *Thinking Backwards.* Start with the assumption that the targeted danger or opportunity has occurred. For example, revolutionary violence undermines the Castro government! Then generate one or more plausible "how-it-could-happen" scenarios, by postulating who would have to do what, when, how, and why.

- *Judgments Discarded.* List assumptions that fell by the wayside in reaching the bottom line. Regarding the judgment that the military will continue supporting the Egyptian government, for example, revisit any available data or supportive reasoning indicating such support may be weakening, for example, among junior officers.

Product Evaluation Staff

July 1995

Note 5

Facts and Sourcing

This is the fifth in a series of Product Evaluation Staff notes to clarify the standards used for evaluating DI assessments and to provide tradecraft tips for putting the standards into practice.

> *The present note is longer than those previously published because it addresses two closely related evaluation standards.*

The credibility of DI assessments with key consumers starts with the analyst's skill in organizing and evaluating the information presented in support of policymaking, warfighting, and law enforcement. Estimative judgments are also important, and at times essential for addressing complex and uncertain issues. But extensive feedback makes clear that US officials with hands-on responsibility for planning and executing policy take their first measure of DI analysts in terms of the judgment they exercise in providing actionable and reliable information:

- As a rule, then, the consumer's confidence in the analyst's estimative judgment comes only after he or she has established credentials for expert command over all-source information.

- Thus, while taking account of space limitations, analysts should err on the side of providing more rather than less relevant information.

This tradecraft note, on *Facts and Sourcing,* presents DI guidelines for depiction in memorandums and briefings of what the DI knows—that is, the character and source of its information. The guidelines will be illustrated by hypothetical examples of "best practices" for handling recurring challenges in characterizing information—for example, addressing the reported attitudes and intentions of foreign actors.

Definitions

DI analysts have a good track record in conveying what they know clearly and credibly to consumers of intelligence. What is undertaken here is codification of rules of thumb into general guidelines.

The following definitions are an attempt to promote standardized use of common terms and concepts relating to intelligence information.

Fact: Verified information; something known to exist or to have happened.

Information: The content of reports, research, and analytic reflection on an intelligence issue that helps analysts and their consumers evaluate the likelihood that something is factual and thereby reduces uncertainty.

Direct Information: Information relating to an intelligence issue under scrutiny the *details* of which can, as a rule, be considered factual, because of the nature of the source, the source's direct access to the information, and the concrete and readily verifiable character of the contents. For example:

- Special intelligence quoting what a foreign official said.
- Imagery providing a count of the number of ships at a pier.
- An event observed by a US Embassy officer.

Indirect Information: Information relating to an intelligence issue the details of which may or may not be factual, the doubt reflecting some combination of the source's questionable reliability, the source's lack of direct access, and the complex character of the contents. For example:

- What a third party told a reliable clandestine source a foreign official said.
- The count of ships at a pier as reported in a foreign government document.
- A US Embassy officer's report of an event based on local media accounts.
- Special intelligence citing what a foreign official believes.

Sourcing: Depiction of the manner in which information was obtained, in order to assist in evaluating the likelihood that the content is factual. A single report from a source or collection platform can contain both direct and indirect information.

Data: Organized information that provides context for evaluating the likelihood that a matter

under scrutiny is factual. The information can be either direct (a chronology of events based on observation by US Embassy officers) or indirect (a chronology based on reports provided by a liaison intelligence service.

These terms are illustrated by the following hypothetical example.

We believe country X has begun a major crackdown on the "Extremist Movement," which the government holds responsible for the campaign of terrorism over the past two years.

The Army has been ordered to support the police in cleaning out *Extremist* strongholds (*direct information*), according to special intelligence (*sourcing*). The President of X reportedly is using last week's attack on a shopping center in a working-class neighborhood to justify calling upon the Army to close down the terrorist campaign (*indirect information*), according to a reliable clandestine source (*sourcing*). The progovernment press reports (*sourcing*) the *Extremists* cannot match Army firepower and are taking high casualties (*indirect information*). A US Embassy observer reports (*sourcing*) seeing Army trucks deliver more than 100 prisoners, some badly wounded, to the Central Prison (*direct information*). According to country X police officials (*sourcing*), these were part of the 1,000 *Extremists* rounded up so far in the crackdown (*indirect information*). CIA's "Country X Terrorism Chronology" indicates this is the first time the Army has been used against the *Extremists* since the terrorism campaign began in 1993 (*data*).

Guidelines

Rule 1. Be precise about what is known.

With US interests, and at times lives, on the line, policymakers, warfighters, and law enforcement officials need to be informed precisely *what the all-source analysts know and how they know it*. In making decisions on whether and how to take action, it is important for them to know if the information is direct or indirect, and if and why the analysts have concluded it is factual.

Most key consumers of intelligence have learned to respect the complexity of the national security issues they are charged with managing and the frequent uncertainty about what is taking place and what lies ahead. DI analysts should write to their standard and not to that of the occasional consumer who *wants answers* no matter what the circumstances.

Thus, in the name of reliability, analysts should never exaggerate what is known. They should report any important gaps in information bearing on US decisionmaking and potential courses of action, as well as relevant information that seems to contradict the main flow of information.

Best Practices

- According to special intelligence, President X has canceled his planned trip to country Y. Imagery indicates no signs of the airport security procedures that usually are undertaken for a Presidential flight. The media in both countries, however, continue to report plans for the scheduled peace talks between the two countries.

- We have no direct information on President X's involvement in narcotics trade, despite persistent charges in the media by his political opponents that his reelection campaign is being financed with funds he obtained from his engagement in trafficking.

Analysts should be precise as well in sourcing information. The phrase, *According to the US Embassy*, for example, does not inform the reader whether the information is direct or indirect.

Best Practices

- US Embassy officers observed sparse crowds at several political rallies.

- In the opinion of a US Embassy official, political support for President X has increased in recent weeks.

Rule 2. Distinguish carefully between information and fact.

Analysts may have direct information on what a foreign leader said, for example, and responsibly conclude this as factual. But what that foreign leader believes, intends to do, and will do cannot be known to be true on the basis of a report on what he or she said.

Best Practices

- According to special intelligence, President X is telling confidants he will fire Prime Minister Y next week.

- President X is reported to be ready to fire Prime Minister Y, according to a reliable clandestine source.

Rule 3. Distinguish carefully between information and estimative judgment.

Analysts' estimative judgments, as indicated, are an important element in the process of supporting policymakers, warfighters, and law enforcement officials. As a rule, these judgments cannot rely solely on reported opinions of foreign players or clandestine sources.

They must be amply argued in terms of the entire body of available information and sound inferential reasoning.

Best Practices

- We believe recovery is under way in Country X. CIA's "Country X Economic Database" shows sustained improvement over the past three months in expanding production and exports and in containing inflation. According to a reliable clandestine source, the Finance Minister has stated that the economy has turned the corner toward recovery.

Also, care should be taken to avoid confusion over whether the DI analyst is making an estimative judgment or a source is expressing an opinion. Thus, the following formulation should be avoided: "Country X has turned the corner toward recovery, as indicated by a reliable clandestine source with access to the Finance Minister."

Best Practices

- According to a reliable clandestine source, the Finance Minister has stated that country X has turned the corner toward recovery.

Rule 4. Take account of substantive complexity.

The more complicated an issue (that is, the more inherently difficult it is to be certain on a matter), the greater the informational demands to establish that the matter under consideration is factual. The burden of proof for determining what foreign leaders or groups believe or intend to do, for example, is much greater than that required for determining what they have done or said. Again, analysts may properly make a conditional judgment about what a foreign leader intends to do. (*We believe country X is preparing to invade country Y.)* But only rarely can this be stated as verified or factual information. (*Country X will invade country Y.)*

Best Practices

- We believe country X is preparing to invade country Y. The deployment of military forces of country X along the border of country Y is consistent both with routine annual military exercises and with preparations for an invasion. Special intelligence, however, indicates two key generals have been called back from an important arms purchase mission abroad. A reliable clandestine source reports that two generals who oppose an invasion have been placed under house arrest. US Embassy officers report extensive civil defense drills and the closing of the national airport to civilian flights. According to a CIA database, these actions have not been undertaken in previous military exercises.

The mindsets of foreign leaders—their attitudes, for example—are also extremely difficult to verify, even with direct or firsthand information, and should rarely be stated as factual. When appropriate, mindset can be a subject for the analyst's estimative judgment.

Best Practices

- Multiple reliable clandestine sources report President X is optimistic about economic prospects.

- President X probably is optimistic about economic prospects. Multiple reliable clandestine sources report his recent upbeat statements. Moreover, recently released IMF statistics indicate a marked improvement in exports and worker productivity.

Rule 5. Take account of policy sensitivity.

As with substantively complex matters, the burden of proof is high on matters that are controversial among policymakers or politically sensitive between the administration and Congress. Directly stated, a solid informational base is needed to present as factual (rather than as the analysts' conditional judgment) something that will be seen by key consumers as *bad news.* As a rule, then, on controversial matters analysts should place emphasis on the relevant information, and not on estimative conclusions.

Best Practices

- Six international observers have described the large-scale election irregularities they monitored in country X, according to press reports. Special intelligence indicates progovernment activists introduced hundreds of bogus ballots into the vote count in three outlying districts. The usually cautious press in country X is reporting alleged eyewitness accounts of progovernment activists denying opposition supporters entry into voting places in several precincts. The legitimacy of the election is coming under increasing question on the part of foreign embassies, according to reliable clandestine sources and press reports.

Similarily, when addressing the behavior of a given country regarding treaties and agreements with the United States, DI analysts should place emphasis on reporting rather than interpretation. As a rule in these matters, *analysts monitor* (report relevant information), and *policymakers verify* (decide whether a violation of a treaty or an agreement has taken place).

Best Practices

- The following information relates to the recent behavior of country X regarding its pledge, under the US economic assistance agreement, to cease support of antigovernment guerrilla forces in country Y:

  —The President of country X told the US Ambassador that all official assistance had been terminated, although small-scale shipments of weapons by private groups that sympathize with the guerrillas' cause might still be taking place.

  —According to a reliable clandestine source, a senior assistant to the President of X has ordered the military to hide small shipments of weapons for the guerrillas in trucks engaged in normal cross-border trade.

  —Special intelligence indicates that a military mission from country X is to await further orders before purchasing abroad communications equipment requested by the guerrillas.

Rule 6. Take account of the possibility of deception.

Deception can be defined as the manipulation of information by a foreign government, group, or individual to get US intelligence analysts to reach an erroneous conclusion. Deception often works because it gives busy analysts what they are seeking—seemingly reliable information on which to base a conclusion.

Here is where the strength of the all-source analyst comes into play. One test for detecting and countering deception is to determine whether all the sources and collection platforms that should be reporting on a matter have indeed done so.

Databases, or organized information, also help. *Is the reported or observed information consistent, in all important details, with past patterns? Do intelligence services with an interest in the matter have a record of perpetrating deceptions?*

So does critical thinking. *Is the information consistent with the analysts' best judgments on the subject's interests, capabilities, and methods of operation?*

Best Practices

- President X assured the US Ambassador on Tuesday that all missile sites in his country had been dismantled, but imagery from last week shows no dismantling activity at the 29 missile sites listed in CIA's database.

- We have no direct information to support reports by a clandestine source with access to Colonel X that antigovernment military forces loyal to him are about to undertake a military coup. No other clandestine sources with military contacts are reporting advanced

coup planning or unusual movements of troops. Opposition political groups abroad report that they are unaware of any serious coup activity, according to multiple reliable clandestine sources. The government, therefore, could be running a deception operation involving Colonel X, to smoke out "disloyal" officers.

Rule 7. Use the term "evidence" sparingly.

This tradecraft note uses the term *information* as synonymous with the term *evidence* as it usually is employed in DI assessments. That is, both are used to refer to the content of reports and research that helps reduce the uncertainty surrounding a specific matter.

The US legal system, however, uses *evidence* in a more specialized manner—to refer to matters introduced in a court case and subject to proof and refutation by contending parties. Because the DI is increasingly providing assessments to support law enforcement officials and because even other kinds of assessments can be subpoenaed for possible use in a court case, analysts should avoid using the term *evidence* when *information* serves their purposes just as well. At times, characterization of the information is sufficient to make the analysts' point for the benefit of consumers.

Best Practices

- Information from special intelligence and clandestine reporting indicates that Justice Minister X has been involved in the narcotics trade.
- Special intelligence and clandestine reporting indicate that Justice Minister X has been involved in the narcotics trade.

Special Circumstances

This note has concentrated on general guidelines for depicting the character and source of the DI's information. The DI serves a broad range of audiences with varied needs and entitlements for intelligence support on a multiplicity of substantive issues. Thus, the special character of the subject matter, the delivery vehicle, or the audience can require exceptions to the rules posited above.

For example, either the limited clearances of the recipients of an assessment or a customer's request for an unclassified memorandum can require the analyst *to avoid precision* in depicting information and sources.

Directorate of Intelligence

Notes on Analytic Tradecraft

Product Evaluation Staff

August 1995

Note 6

Analytic Expertise

This is the sixth in a series of Product Evaluation Staff notes to clarify the standards used for evaluating DI assessments and to provide tradecraft tips for putting the standards into practice.

Analytic expertise establishes the DI's authority to speak to an issue on which US national security interests are at stake. Demonstration of expertise in DI assessments is thus needed to gain access to and credibility with the policymakers, warfighters, and law enforcement officials who carry the heaviest burden for US decision and action on national security issues.

As with all evaluation criteria addressed in these tradecraft notes, analysts have to tailor their demonstration of expertise in individual memorandums and briefings to the circumstances of each assignment. These include the degree of substantive complexity, the analytic requirements and timeline of the policymaking process, and whether the DI production unit already has established close ties to its key clients.

As a rule though, no DI product should be delivered without deliberate effort to make it stand out from the formidable competition including other intelligence providers, journalists, scholars, lobbyists, and various additional purveyors of information and judgment:

- Demonstration of in-depth substantive knowledge is usually the most important element in establishing the credentials for a DI product. To a large extent, the Directorate *is* what it knows and can bring to bear to reduce uncertainty on complex issues.

- Analytic expertise is also conveyed by (1) skill in accessing and interpreting clandestine and technically collected information, (2) deft organization of data in support of findings and judgments, (3) dealing effectively with longshot contingencies and with uncertainty generally, and (4) demonstrating insight into the decisionmaking processes of intelligence customers.

How much expertise needs to be demonstrated? Taking space and time limitations into account, the more the better. The DI not only has to stand out regarding the breadth and depth of its analytic expertise, it also has to convince its key customers that it can put this expertise to use for their benefit.

Again, the appropriate means through which to convey expertise varies with each analytic assignment. As a general test, we recommend that analysts read their first draft critically, to answer the following questions *as if they were posed by a policy official deciding whether to rely on the DI to meet the challenges on his or her agenda.*

- Do the analysts show in-depth knowledge of their subject—the history, civil culture, and other general contexts of the issue, as well as the latest reporting?
- Is there evidence that the analysts have "been there" or represent an analytic and operational team with members who have experience-based insights?
- Have the analysts brought to bear all the dimensions or disciplines that define the issue—political, economic, military, S&T?
- Have the analysts brought to bear all-source information and made a special effort to help the busy intelligence user grasp the key patterns revealed by the information?
- Do the timing and format reflect the analysts' sensitivity to the timeline, decision points, and underlying tensions (areas under debate) of the policymaking process?
- Do the analysts have an effective method or structure for arraying information and reducing uncertainty?
- Further on uncertainty, do the analysts help me think through complex challenges by making their key assumptions clear and dealing rigorously with alternative interpretations and outcomes?
- In sum, would I want to rely on DI analysts and pose followup tasking, to deal with the threats to, and opportunities for, US interests on my policy agenda?

Tradecraft Tips

Research papers are natural vehicles for effective display of analytic expertise. DI veterans, over the years, have devised an armory of measures for demonstrating hard-earned individual and collective expertise even in quick turnaround papers and within the space limitations for most DI deliverables. We list below some of these measures:

- *Evidence of previous research.* In a preface, footnote, textbox, or annex, list related finished intelligence on the subject at hand. Be sure to take a Directorate or team approach by citing the works of other production units.

- *Evidence of scholarship.* Often one footnote or textbox that indicates the breadth of the analysts' grasp helps to establish credentials. For example, citing a historical incident with either common or contrasting elements to the issue at hand.

- *Evidence of data bases.* Expertise can be demonstrated by a paragraph or textbox that presents a chronology, a series of quotes over time by a foreign leader, or a schematic representation of trends (terrorist incidents, inflation or economic growth rates, growth in military inventories, S&T milestones).

- *Evidence of ground truth.* At times it takes only a sentence or two to demonstrate special insight into key personalities, groups, and forces at work. Use your own feel for the ground truth or rely on your analytic teammates to work in some experience-based references. Examples could include references to local political humor, to the household commodities on which short supplies would be most likely to cause popular disgruntlement, or to the modus operandi of local intelligence and security forces.

- *Evidence of teamwork.* Put your professional support colleagues to work on your behalf to clarify a key point or to organize and display the information supporting a point—via annotated maps, imagery, and other graphics. Interviews with customers indicate that those who are heavily engaged on an issue particularly appreciate visual aids that help in keeping up with the fire hose of information.

- *Leadership analysis.* US leaders, naturally enough, tend to be interested in foreign leaders, especially their approach to making decisions, negotiating, and dealing with conflict. Addressing these matters in the text, a textbox, or an annex demonstrates both the breadth and depth of the DI's collective expertise.

- *Secrets.* Excessive classification should be avoided in assessments intended for a broad and general audience. But when a DI assessment is intended for the handful of officials fully engaged (and fully cleared) on an issue, contextual explanation of information from clandestine and technical sources conveys a sense of special expertise.

- *Mysteries.* Demonstrating skill in dealing with uncertainty is appreciated by the hands-on policy officials who have to decide which risks to cover. This includes making explicit the assumptions that drive the argumentation and taking account of low-probability, high-impact contingencies. Here, too, the coverage can be set aside in a textbox or annex, if the goal is to keep the main text lean.

- *The only game in town.* Understandably, policy officials believe that policymaking and implementation is the reason why intelligence exists, and not vice versa. Analysts should demonstrate—in a cover note, preface, or footnote, if not in the main text—that they are informed on the policy timeline and the key matters under debate. Indeed, few things call the DI's reputation into question more than an assessment that arrives after a decision has been made or that addresses in a conventional manner issues on which there already is both broad knowledge and consensus among policy officials.

- *Customized support.* When writing for a small number of officials, analysts can demonstrate by the issues they highlight that they know where their consumers are on their learning curve as well as their decision cycle.

Expertise in Support of the Intelligence Consumer

We end with an obvious caution. When the analysts know their clients' specific needs, demonstration of expertise is readily projected as a tool or means for providing value added. With larger assessments prepared for a broader audience, more care has to be taken to avoid excessive display of knowledge—that is, substantive expertise as an end in itself. Here is where investment in knowing the timelines of the policymaking process and the specific dangers and opportunities policy officials are dealing with comes into play.

September 1995

Note 7

Effective Summary

This is the seventh in a series of Product Evaluation Staff notes to clarify the standards used for evaluating DI assessments and to provide tradecraft tips for putting the standards into practice.

The summary plays a key role in determining the kind of impact a DI report or memorandum will have on the policymaking process. Thus, within the allotted space, the summary has to make the distinctive DI value added stand out—whether consisting of special intelligence with immediate bearing on US security interests, important findings from the sifting of all-source information, or actionable judgments about pending threats and opportunities.

As with other criteria covered in this series of tradecraft notes, analysts have to tailor each summary to the circumstances of the individual assignment. One way or another, though, the analyst has to crystallize the DI expertise presented in the text in a manner that will seize the attention of the intended audience.

When the clients for the assessment are few in number and their priority interests regarding US policy and action agendas are well known to the DI, the analysts' job is to craft a summary that crisply presents the *what's new* and the *so what:*

- For example, in a Special Intelligence Report, the allotted "hook" of a couple of lines of text must be designed to assure the intelligence consumer that his or her time will be well spent in digesting the rest of the report.

When an assessment is broadcast to a larger and more diffuse audience, the analysts' challenge in determining the structure and content of the summary is greater. Usually, the two most important goals are:

- *To highlight the value added of the paper* against the contingency that busy readers will not get into the main text, especially the implications regarding threats to and opportunities for US interests.

- *To support these values with distinctive expertise* in order to motivate the "gatekeepers" to read the text and recommend that their principals survey sections targeted to help them advance their policy and action agendas.

To account for the diversity of the potential audience for broadcast assessments, other introductory sections can be put to use in flagging the full range of value added and DI expertise. In particular, an *introductory textbox*, placed immediately after the summary, can be used to meet the needs of specialized segments of the audience:

- For example, a depiction of the background or general context that would try the patience of the officials already directly engaged on a policy issue can be provided in a textbox to serve the needs of peripherally engaged intelligence consumers.

- Similarly, technical findings needed to meet the threshold of value added for a small, highly specialized portion of the intended audience can be placed in a textbox.

- And when depiction of policy implications on a controversial issue requires more space for balanced presentation than a summary can accommodate (for example, cost-benefit analysis of alternative courses of action), a textbox is an effective solution.

A *preface* is also a useful instrument, in longer and broadly distributed assessments, for supplementing the summary:

- Use it to explain to peripherally engaged readers the precise policy challenges the assessment seeks to clarify.

- Use it to augment DI credibility; for example, by listing prior publications on the issue at hand.

Tradecraft Tips

DI veterans offer the following experience-based tips for enhancing the effectiveness of summaries:

- *Conform the summary to the text and vice versa.* Often the process of squeezing all the values of the text into a summary paragraph or page sharpens the analyst's depiction of key variables (drivers), cause-and-effect relationships, and argumentation generally. Retrofit any new insights and values into the text.

- *Break up the typography.* Many readers interpret summaries with paragraph blocks that run solidly from margin to margin as a signal that the memorandum or report is "user unfriendly":

  —Use short paragraphs, bullets and subbullets, **bold face**, and *italics* to break up the space and to help the busy decisionmaker latch on quickly to the key information, relationships, and judgments.

- *Fit the writing style to audience and purpose.* When writing for a broad audience, including many policy officials with whom the production unit has only limited contact, top-quality exposition can help attract the readers' attention to the main text. When working in support of a single consumer, however, consider using a more informal style to speed his or her grasp of the value added:

  —One official reported that he did not have time for "whole sentences"—just for what it was the analyst wanted him to know.

- *Concentrate on the new and important.* Historical background and other setting of the context can be presented tersely or dispensed with altogether. Use the allotted space to concentrate on content that will make a difference to well-informed policymakers, warfighters, and law enforcement officers as they contend with their daily challenges:

  —This usually means policy implications. In effect, the summary is a vehicle for explaining why a busy policy official should spend time on a DI product.

  —Strive to make the summary *actionable*; that is, structure it to help a policy official get something started, stopped, or otherwise sorted out.

- *Role-play key members of the targeted audience.* Regarding what belongs in and what can be omitted from the summary: If you were a time-challenged policy official, what would you want to gain from spending five minutes or so with your assessment?

- *Make fewer points, but make them well.* If you have to choose between the quantity and quality of the points made in the summary, opt for the latter. This is particularly important when writing for a well-informed audience which has no need for a "tutorial" on the issue:

  —If the assessment makes a bottom-line predictive judgment, refer to the key assumptions and other essential elements of the argumentation.

  —If the assessment conveys important new findings, cover the reliability of the sourcing and the essence of the methodology.

Note 8

Implementation Analysis

This is the eighth in a series of Product Evaluation Staff notes to clarify the standards used for evaluating DI assessments and to provide tradecraft tips for putting the standards into practice.

This note discusses *Implementation Analysis*, one of the techniques for extending customized intelligence support to policymakers, law enforcement officials, and warfighters outlined in Note 1, *Addressing US Interests in DI Assessments.*

Implementation Analysis provides decisionmakers and action takers with an assessment of tactical alternatives for pursuing opportunities and averting dangers regarding established US policy goals. The role of the analyst complements but is distinctive from the role of the policymaker:

> *Analysts identify and evaluate alternatives for implementing objectives; policy officials first set the objective and then make the decisions about which tactics to adopt.*

Illustrative hypothetical cases of Implementation Analysis include:

- Identifying the major supply routes available to a military adversary and evaluating their logistic importance and vulnerability to US attack.
- Identifying the money-laundering techniques used by a major drug trafficker and evaluating their vulnerability to disruption and curtailment.
- Identifying and evaluating the economic vulnerabilities that could be exploited to leverage a foreign government to terminate development of a nuclear weapons capability.
- Identifying diplomatic, political, and economic initiatives that could be taken to shore up an unstable government the United States wishes to keep in office.
- Identifying and evaluating confidence-building measures either to draw military adversaries into negotiations or to restart stalled talks.

Why and When

Policy implementation regularly involves attempting to advance US interests under uncertain and often risky conditions. In these circumstances, policy officials recognize that US objectives can be difficult to achieve. Deterring rogue states from developing weapons of mass destruction and promoting democratic practice in polities with entrenched authoritarian traditions, for example, require overcoming deeply imbedded obstacles. Policy officials need support from intelligence analysts in identifying and assessing opportunities and dangers.

Intelligence analysts, through Implementation Analysis, can bring important value added to the policymakers' table:

- Expertise in understanding foreign cultures, including the risk analysis and negotiating styles of adversaries and allies.

- Findings on strengths and vulnerabilities of target countries and organizations, based on evaluation of all-source information.

- Detachment from departmental bureaucratic pressures and a commitment to objectivity in examining tactical alternatives.

Even when the analysts' inventory of alternatives largely mirrors that of policy officials, the latter benefit from exposure to the organized information and rigorous argumentation of the former.

In addition to its intrinsic value added, Implementation Analysis can also help the DI maintain effective policy ties on politically charged issues. When pursuit of US goals entails coping with multiple difficult challenges, heavily engaged policy officials do not appreciate a steady stream of DI assessments that reminds them (as well as congressional critics, for example) that they are working against long odds. Implementation Analysis sends the message that the intelligence team, although professionally committed to objectivity, is not indifferent to the challenges the policy team faces and will lend its expertise to help advance and protect US interests even under difficult circumstances.

In any case, analysts should place a premium on close lines of communication in delivering Implementation Analysis:

- As a rule, policy officials should *request* such customized support.

- Intelligence managers who are well connected to the officials doing the heavy lifting can, at times, advertise the capability and solicit a request.

The initial DI delivery of Implementation Analysis usually consists of a briefing or memorandum for one or a handful of principal policy officials. In recognition of the value added, the latter have in the past subsequently asked for:

- Regularly scheduled repeat briefings or memorandums.
- An increase in the circle of recipients.
- Incorporation of the analysis into policy planning documents.

Tradecraft Tips

Veteran analysts offer the following tradecraft tips for putting Implementation Analysis into practice:

- Redefining an intelligence issue in the policymakers' terms can be a useful first step for providing value added through Implementation Analysis. In other words, analysts shift focus from their normal quest for understanding *what's going on in country X* to the policymakers' quest for *doing something about what's going on in country X.* This requires:

  —Recognition of the policymakers' role as "action officers"—charged with getting things started or stopped among adversaries and allies overseas.

  —Recognition of the policy officials' propensity at times to take risk for gain. For example, policymakers may see a one-in-five chance of turning an unsatisfactory situation around as a sound investment of US prestige and their professional energies.

- Analysts also gain insight for adding value by concentrating on what it takes to achieve the operational goal (*think like a policy professional)* before turning to an objective survey of the ground truth (*execute like an intelligence professional*):

  —For example, if the objective of US policy is to leverage a foreign government or organization to reverse its course, analysts can first think of what developments could lead to that outcome and then make an inventory of the forces at play that could trigger such developments.

- The *If, Then* structure often can be used to relate US tactics to US goals, while reserving the DI's tough-minded analytic posture toward both—that is, without crossing the line between professional analytic support of the policymaking process and poliey prescription. For example:

  —*If* US policy calls for getting from point A to point B, *then* here are some gateways to consider and some cul-de-sacs to avoid.

  —*If* the US policy objective is to strengthen the forces for moderation in country X, *then* the following factors should be examined as potential catalysts for the desired development.

- Implementation Analysis often requires *divergent thinking*—the setting aside of attention to mainstream interpretations and the most likely outcome and focusing instead on the full range of plausible alternative interpretations and outcomes. Analytic techniques such as brainstorming, role playing, and "thinking backward" (examining the paths by which a low-probability event could occur) can help identify little-known forces at play that could effect a change in momentum:

  —When analysts are pessimistic about prospects for advancing US objectives, they can employ a variation of the Sherlock Holmes methodology for moving forward when there is no promising suspect in a murder case. *Provide policymakers with an assessment of the least unpromising tactical alternatives.*

  —DI analysts, in effect, are the scouts that provide information and insights to help the policymaker-coach develop the most sensible game plan, win or lose.

- In addition to knowledge of the ground truth, the value added of Implementation Analysis can depend on analysts' knowledge of US instruments for leveraging a situation (that is, the available *carrots and sticks*). Analysts are well advised to make an inventory of US means for executing foreign policy based on the study of policy documents and discussions with intelligence managers and contacts in policy agencies.

- The final step for Implementation Analysis is presentation of the results of the analytic process in ways that make it clear that professional analysts have been at work. Often the responsible policy officials will be more interested in *how analysts reached their evaluations of alternatives* than in the evaluations per se:

  —Presentation and ranking of alternatives via a matrix containing a rough cost-benefit analysis is a useful way to convey the analysts' underlying all-source findings and linchpin assumptions. At the same time, such a matrix focuses the DI effort on *analyzing alternatives*, while leaving the actual choosing to the policymakers.

- Because Implementation Analysis calls on distinctive and challenging tradecraft techniques, analysts should engage colleagues and managers early on in the process of defining the issue and selecting promising tactical alternatives to assess. This team approach will help tap into corporate expertise, as well as smooth the coordination and review processes.

Note 9

Conclusions

This is the ninth in a series of Product Evaluation Staff notes to clarify the standards used for evaluating DI assessments and to provide tradecraft tips for putting the standards into practice.

Conclusions—the analysts' findings based on organizing, evaluating, and interpreting the all-source information available on the issue at hand usually are the most important value added for key consumers of DI assessments. Because policymakers and action takers rely on DI assessments as they define and defend US interests, analysts must be precise in conveying the level of confidence in their conclusions, taking appropriate account of the prospect of deception and other sources of uncertainty.

Heavily engaged policy officials often receive directly much of the open-source and intelligence information available to DI analysts. But the policy officials need DI assistance in keeping track of the facts, fictions, and trivia. The important event has to be identified from among the ordinary, the underlying patterns have to be cobbled together from seemingly unrelated pieces of information, and the reliable sources have to be distinguished from the self-serving.

On complex national security issues the information available to the analysts rarely speaks for itself. Gaps and inconsistencies are the rule. This is where the DI analysts' expertise comes into play. When seasoned and skeptical DI analysts believe they have made their case by a careful scrubbing of ample all-source information, they should lean forward in making their conclusions precise and clear to the policy officials responsible for management of the issue. Analysts who have organized and evaluated their information are able to *conclude* with authority, for example:

- The latest information shows country "X's" expenditures on weapons-related technology *increased sharply* in 1995 after several years of little or no growth.

- DI data demonstrate that incidents of human rights violations in country "Y," as reported by international monitors and reliable clandestine sources, are *decreasing for the first time* since the military government took power in 1989.

- The DI database shows that terrorist incidents in country "Z" *are taking on a pattern* of attempting to intimidate the foreign business community.

- Examination of DI chronologies of the seven national elections since the restoration of civilian government in country "A" indicates that recent government use of armed thugs to break up opposition political rallies *is without precedent.*

- The *cause-and-effect relationship* between Premier "B's" political difficulties and his calling for military exercises to turn public attention to the "foreign threat" is by now well established.

DI assessments are particularly valuable to policy officials when the analytic findings are derived from the collective databases of a multidisciplinary team. Depiction of the political context for a foreign country's lax policy on narcotics controls, for example, or its financial and technological potential for pursuing a nuclear weapons program enables users of DI analysis to take a better measure of the potential risks and benefits of contemplated US policy initiatives.

In contrast, when available information is incomplete or susceptible to foreign deception operations and other sources of ambiguity, the analysts' reasonable doubts about, say, cause-and-effect relationships should be shared with the officials who may rely on DI assessments in taking policy actions.

Many of the issues that the DI tackles are inherently complex and thus shrouded by uncertainties. The analysts have a professional obligation—where warranted—to conclude that *they do not know*. In such instances, presentation of two or more plausible interpretations of the available information makes a more useful conclusion than a single unreliable one masked in vague language (for example, *a real possibility*).

Analysts should be particularly wary about projecting thin information as a DI conclusion. When, for example, analysts do not have a solid informational base and are relying on a small number of reports depicting an event as unprecedented or a pattern as well-established, they should attribute such conclusions to the source. Clandestine agents, foreign officials, and the local media may jump to conclusions. DI analysts should not.

In sum, the value added to policymakers, negotiators, warfighters, and law enforcement officials of conclusions in DI memorandums and briefings rests on:

- The solidity of the individual and collective DI expertise brought to bear through analysis of databases and other information.

- The precision analysts use in stating levels of confidence in their findings.

Tradecraft Tips

DI veterans offer the following recommendations for conveying conclusions effectively:

1. When analysts have reached firm conclusions on complex and especially controversial issues, take the time to present the data, to point to the relationships and other implications, and to state the conclusions forcefully. For example:

- The latest technically collected information, when combined with previous all-source reporting, indicates that country "X" has the means to conduct a weapons test within months, if not weeks.

2. Again, when an issue is complex and controversial, describe the credentials that lie behind the findings—in a textbox or footnote, if not in the main text. For example: depict the reliability of the sources of the information and other specific characteristics of a database; spell out the indicators used to determine diversion to military use of dual-purpose technology imports.

3. To minimize confusion when conveying a necessarily qualified conclusion, think of supplementing adverbial descriptors with a statement of rough numerical odds:

- On the basis of the well-documented effectiveness of "X's" intelligence service in penetrating previous plots and the poor security exhibited by the present conspirators, the President almost certainly knows about the impending coup attempt (roughly a 90-percent likelihood).

4. When the quality of available information requires either reserving judgment about conclusions or presenting multiple plausible interpretations, consider including a textbox or annex on information gaps and collection requirements.

5. When the text must be kept brief because of space limitations of a DI art form, the findings can be laid out in some detail in a textbox. This coverage can be useful both for those consumers who need a quick study into the issue and those with direct responsibility for decision and action who have an interest in taking precise account of what the DI knows.

6. Also use a textbox to explain any major shift in a DI conclusion from previous assessments or the basis for a contrasting conclusion held by other Intelligence Community analysts.

7. When appropriate, use chronologies, matrices, and other graphics to supplement the text in conveying complex trends and relationships. Even the best informed policy officials appreciate graphics that help them evaluate important information.

8. Conclusions are the bedrock foundation for estimative judgments in DI assessments that address future patterns of development. In papers that are divided between sections that set out the findings and those that make predictive judgments, analysts may find it useful to summarize the findings in a textbox immediately preceding the estimative portion. This helps clarify the argument for the critical reader. It can also help analysts audit their own logic trail.

December 1995

Note 10

Tradecraft and Counterintelligence

This is the 10th in a series of Product Evaluation Staff notes to clarify the standards used for evaluating DI assessments and to provide tradecraft tips for putting standards into practice.

This tradecraft note addresses the aspect of counterintelligence (CI) on which the DI is most directly responsible for improved Agency performance: *Countering deception operations by foreign governments and organizations aimed at distorting the conclusions and judgments of analysts' assessments.*

A subsequent note will address related CI aspects on which DI substantive expertise and analytic skill can make important contributions, including (1) countering espionage by helping to identify the US secrets foreign intelligence services are most interested in obtaining and (2) analytic support of efforts to manipulate foreign intelligence operations to US advantage.

Deception is here defined as all efforts by a foreign intelligence service or adversarial group to distort and otherwise manipulate the perceptions of analysts in order to place analysts and their policy clients at a disadvantage in understanding and dealing with the perpetrating country or group. Deception operations can be divided into two closely related subsets:

- *Denial*—measures taken to protect secrets through concealment, camouflage, and other activities that degrade collection systems, including the information analysts receive from open sources, diplomatic channels, clandestine assets, and technical collection.

- *Disinformation*—operations to feed analysts false or partly false information through the use of double agents and manipulation of diplomatic and media as well as intelligence channels.

Countering Deception

For DI analysts, the first step in improving CI performance is to show increased respect for the deceiver's ability to manipulate perceptions and judgments by compromising collection systems and planting disinformation. Next, analysts must adjust the balance between *speed* and *care* in producing DI assessments. There is no "free lunch" here. The analysts' major

defense for countering deception—exercising increased care in evaluating information and in testing working assumptions—places pressures on the DI commitment to timeliness in servicing consumer demand for tailored products.

The key to holding down the opportunity costs of countering deception is to tie the effort as closely as possible to the normal processes analysts use to expand expertise and to ensure quality and policy utility in their memorandums and briefings:

- As analysts become more accomplished in countering deception they also become better qualified to provide value added to decisionmakers and action takers who need customized support based on *reliable* all-source information.

Warning Signs

Through an investment in understanding the warning signs that a deception operation may be under way, analysts become more expert about their subjects as well as about when and how to apply their main weapons for protecting the integrity of DI assessments:

- Skepticism about the reliability of *all information*, whether from human or technical collection, whether open source or classified, and no matter what the level of classification.

- Readiness to challenge and test even well-established assumptions about trends, patterns, and cause-and-effect relationships.

The first set of warning signs addresses the likelihood that a country or organization is engaged in an attempt to distort the analysts' perceptions:

1. ***Means***. The country or entity (for example, terrorist group) being assessed has the experience and means to undertake sophisticated deception operations. Nearly all countries and entities given priority attention under PDD 35 have well-practiced means to deceive, often in third countries as well as at home.

- Becoming more expert on foreign intelligence practices will also provide analysts with greater understanding of the political dynamics of the country or entity under study, especially when intelligence services are a vital part of the power equation.

2. ***Opportunity***. The foreign country or entity is known to have countered the collection systems or platforms on which the DI analyst is particularly dependent. For example, when a target country has knowledge of the periodicity and acuity of technical collection vehicles that pass over an area it wishes to protect, analysts have to be aware that the resultant information may be incomplete if not also deliberately distorted.

Enhanced knowledge of both the reach and the vulnerabilities of collection systems will also help analysts in dealing with the everyday challenges of evaluating incomplete and ambiguous information.

3. ***Motive***. A motive to deceive is believed to be present. Accomplished intelligence services—for example, in Russia, China, or Cuba—have the ability to mount elaborate denial and disinformation operations virtually across the board. Would they see a high payoff from distorting analyst and policymaker perceptions about the issue at hand?

- Knowledge of which secrets an adversary most seeks to protect adds a distinctive perspective to the analysts' understanding of the country's military, political, and economic priorities.

The second set of warning signs focuses on anomalies in the information available to the analyst. Investment in addressing these warning signs reinforces core skills regarding what the analysts know, how they know it, and what they do not know that could affect the outcomes in ways important to policy officials, warfighters, and law enforcement officials. See, for example, Tradecraft Note No. 5, *Facts and Sourcing* (July 1995).

These warning signs include:

4. ***Suspicious gaps in collection***. For example, when information central to the analysts' conclusions and judgments received through one collection channel is not supported to the extent expected from the take of other collection systems. In other words, the analysts are not receiving the range and volume of information they would expect if there was no deliberate tampering with sources and collection platforms.

5. ***Contradictions to carefully researched patterns.*** Does new information undercut the trends and relationships honed through past research? While analysts must be openminded about the possibility of unexpected change, they should examine critically information that signals an inexplicable change, for example, in an adversary's priorities and practices.

6. ***Suspicious confirmations***. For example, when a new stream of information from clandestine sources or technical collection seems to reinforce the rationale for or against a US policy initiative. In these circumstances, receiving the same "story" from more than one DO or diplomatic source does not in itself speak to the authenticity of the information.

Tradecraft Tips

The effort needed to meet the DI standard of ensuring appropriate protection against deception at the lowest net cost to timeliness will vary from case to case. For each assignment, analysts and managers will have to weigh the costs to credibility of being deceived against the opportunity costs of increased care. Below are general schemes for proceeding efficiently against two distinct levels of risk for DI assessments on complex issues.

Regular Issues. We recommend a two-step defense against deception for assessments on which there is no specific reason to suspect deception is at play and on which the primary value added to consumers is a general increase in understanding (as contrasted with tailored support for decision and action):

Step One. Organize the key information by setting it out, for example, on a yellow pad or blackboard, and examine it critically with warning signs of deception in mind. Are all the expected collection systems kicking in? Is the information appropriately consistent? Are the pieces of information on which conclusions and judgments are most heavily based from a *reliable* clandestine source or *uncompromised* collection platform?

- This investment of, say, one hour in questioning the authenticity of sources will occasionally turn up something suspicious. Even when it does not, analysts, as a result of the effort, will be better able to refine and defend their conclusions and judgments.

Step Two. Play Devil's Advocate and develop a hypothetical argument for the case that deception is taking place; that is, a foreign entity *is* attempting to manipulate perceptions through some combination of denial and disinformation. Then determine to what extent the information organized in Step One lends support to the case for the existence of a deception operation. Look for "hits and misses" between the information and the hypothetical case that substantially raise or diminish the likelihood of the presence of an elaborate deception effort.

- This investment of an additional hour or so will also at times raise suspicions that require more deliberate attention. The investment also enhances skill in structuring plausible low-probability, high-impact scenarios, a key to meeting the demands of policy officials for more help in contingency planning.

Suspect and Sensitive Issues. Where there is reason to suspect the presence of deception (based on general warning signs and the exercises outlined above), analysts should undertake a more elaborate defense of the integrity of their assessments. With or without cause for suspicion, an extended defense should also be employed on sensitive issues—those on which the policy officials may directly rely in making decisions on whether to take military, diplomatic, or economic actions to defend US interests.

On suspect and sensitive issues, we recommend that analysts prepare a textbox or annex that addresses the possibility that a deception operation is distorting the assessment's conclusions and estimative judgments. Managers should consider preparation and defense of the textbox

as an essential element of the analyst's effort, even in instances when they determine it is unnecessary to publish it.

The content of the recommended assessment of the integrity of information will vary with circumstances. But at a minimum it should convey that (1) the possibility of the presence of deception has been taken seriously, (2) analytic tests to determine the likelihood of deception have been executed, and (3) any reasonable doubts are forthrightly reported.

Specific questions that analysts can address with profit include:

1. What is known of the ability of the country or group under examination to engage in deception? About incentives to do so?

2. What is known about the reliability and integrity of the sources and collection platforms most heavily depended upon?

3. What can be said about the availability and consistency of information from all relevant sources and platforms?

4. What tradecraft tests were used to evaluate the authenticity of the information relied upon to reach key conclusions?

In sum, such a textbox provides the analysts with an answer to a question likely to be posed with greater frequency by Agency leaders and policy officials in the wake of the Ames case: *How do you know you are not being deceived?*

Author's Preface

This volume pulls together and republishes, with some editing, updating, and additions, articles written during 1978–86 for internal use within the CIA Directorate of Intelligence. Four of the articles also appeared in the Intelligence Community journal *Studies in Intelligence* during that time frame. The information is relatively timeless and still relevant to the never-ending quest for better analysis.

The articles are based on reviewing cognitive psychology literature concerning how people process information to make judgments on incomplete and ambiguous information. I selected the experiments and findings that seem most relevant to intelligence analysis and most in need of communication to intelligence analysts. I then translated the technical reports into language that intelligence analysts can understand and interpreted the relevance of these findings to the problems intelligence analysts face.

The result is a compromise that may not be wholly satisfactory to either research psychologists or intelligence analysts. Cognitive psychologists and decision analysts may complain of oversimplification, while the non-psychologist reader may have to absorb some new terminology. Unfortunately, mental processes are so complex that discussion of them does require some specialized vocabulary. Intelligence analysts who have read and thought seriously about the nature of their craft should have no difficulty with this book. Those who are plowing virgin ground may require serious effort.

I wish to thank all those who contributed comments and suggestions on the draft of this book: Jack Davis (who also wrote the Introduction); four former Directorate of Intelligence (DI) analysts whose names cannot be cited here; my current colleague, Prof. Theodore Sarbin; and my editor at the CIA's Center for the Study of Intelligence, Hank Appelbaum. All made many substantive and editorial suggestions that helped greatly to make this a better book.

—Richards J. Heuer, Jr.

Foreword

By Douglas MacEachin[1]

My first exposure to Dick Heuer's work was about 18 years ago, and I have never forgotten the strong impression it made on me then. That was at about the midpoint in my own career as an intelligence analyst. After another decade and a half of experience, and the opportunity during the last few years to study many historical cases with the benefit of archival materials from the former USSR and Warsaw Pact regimes, reading Heuer's latest presentation has had even more resonance.

I know from first-hand encounters that many CIA officers tend to react skeptically to treatises on analytic epistemology. This is understandable. Too often, such treatises end up prescribing models as answers to the problem. These models seem to have little practical value to intelligence analysis, which takes place not in a seminar but rather in a fast-breaking world of policy. But that is not the main problem Heuer is addressing.

What Heuer examines so clearly and effectively is how the human thought process builds its own models through which we process information. This is not a phenomenon unique to intelligence; as Heuer's research demonstrates, it is part of the natural functioning of the human cognitive process, and it has been demonstrated across a broad range of fields ranging from medicine to stock market analysis.

The process of analysis itself reinforces this natural function of the human brain. Analysis usually involves creating models, even though they may not be labeled as such. We set forth certain understandings and expectations about cause-and-effect relationships and then process and interpret information through these models or filters.

The discussion in Chapter 5 on the limits to the value of additional information deserves special attention, in my view—particularly for an

1. Douglas MacEachin is a former CIA Deputy Director of Intelligence. After 32 years with the Agency, he retired in 1997 and became a Senior Fellow at Harvard University's John F. Kennedy School of Government.

intelligence organization. What it illustrates is that too often, newly acquired information is evaluated and processed through the existing analytic model, rather than being used to reassess the premises of the model itself. The detrimental effects of this natural human tendency stem from the raison d'etre of an organization created to acquire special, critical information available only through covert means, and to produce analysis integrating this special information with the total knowledge base.

I doubt that any veteran intelligence officer will be able to read this book without recalling cases in which the mental processes described by Heuer have had an adverse impact on the quality of analysis. How many times have we encountered situations in which completely plausible premises, based on solid expertise, have been used to construct a logically valid forecast—with virtually unanimous agreement—that turned out to be dead wrong? In how many of these instances have we determined, with hindsight, that the problem was not in the logic but in the fact that one of the premises—however plausible it seemed at the time—was incorrect? In how many of these instances have we been forced to admit that the erroneous premise was not empirically based but rather a conclusion developed from its own model (sometimes called an assumption)? And in how many cases was it determined after the fact that information had been available which should have provided a basis for questioning one or more premises, and that a change of the relevant premise(s) would have changed the analytic model and pointed to a different outcome?

The commonly prescribed remedy for shortcomings in intelligence analysis and estimates—most vociferously after intelligence "failures"—is a major increase in expertise. Heuer's research and the studies he cites pose a serious challenge to that conventional wisdom. The data show that expertise itself is no protection from the common analytic pitfalls that are endemic to the human thought process. This point has been demonstrated in many fields beside intelligence analysis.

A review of notorious intelligence failures demonstrates that the analytic traps caught the experts as much as anybody. Indeed, the data show that when experts fall victim to these traps, the effects can be aggravated by the confidence that attaches to expertise—both in their own view and in the perception of others.

These observations should in no way be construed as a denigration of the value of expertise. On the contrary, my own 30-plus years in the business of intelligence analysis biased me in favor of the view that, end-

less warnings of information overload notwithstanding, there is no such thing as too much information or expertise. And my own observations of CIA analysts sitting at the same table with publicly renowned experts have given me great confidence that attacks on the expertise issue are grossly misplaced. The main difference is that one group gets to promote its reputations in journals, while the other works in a closed environment in which the main readers are members of the intelligence world's most challenging audience—the policymaking community.

The message that comes through in Heuer's presentation is that information and expertise are a necessary but not sufficient means of making intelligence analysis the special product that it needs to be. A comparable effort has to be devoted to the science of analysis. This effort has to start with a clear understanding of the inherent strengths and weaknesses of the primary analytic mechanism—the human mind—and the way it processes information.

I believe there is a significant cultural element in how intelligence analysts define themselves: Are we substantive experts employed by CIA, or are we professional analysts and intelligence officers whose expertise lies in our ability to adapt quickly to diverse issues and problems and analyze them effectively? In the world at large, substantive expertise is far more abundant than expertise on analytic science and the human mental processing of information. *Dick Heuer makes clear that the pitfalls the human mental process sets for analysts cannot be eliminated; they are part of us. What can be done is to train people how to look for and recognize these mental obstacles, and how to develop procedures designed to offset them.*

Given the centrality of analytic science for the intelligence mission, a key question that Heuer's book poses is: Compared with other areas of our business, have we committed a commensurate effort to the study of analytic science as a professional requirement? How do the effort and resource commitments in this area compare to, for example, the effort and commitment to the development of analysts' writing skills?

Heuer's book does not pretend to be the last word on this issue. Hopefully, it will be a stimulant for much more work.

Introduction

Improving Intelligence Analysis at CIA: Dick Heuer's Contribution to Intelligence Analysis

by Jack Davis[2]

I applaud CIA's Center for the Study of Intelligence for making the work of Richards J. Heuer, Jr. on the psychology of intelligence analysis available to a new generation of intelligence practitioners and scholars.

Dick Heuer's ideas on how to improve analysis focus on helping analysts compensate for the human mind's limitations in dealing with complex problems that typically involve ambiguous information, multiple players, and fluid circumstances. Such multi-faceted estimative challenges have proliferated in the turbulent post-Cold War world.

Heuer's message to analysts can be encapsulated by quoting two sentences from Chapter 4 of this book:

> Intelligence analysts should be self-conscious about their reasoning processes. They should think about *how* they make judgments and reach conclusions, not just about the judgments and conclusions themselves.

Heuer's ideas are applicable to any analytical endeavor. In this Introduction, I have concentrated on his impact—and that of other pioneer thinkers in the intelligence analysis field—at CIA, because that is the institution that Heuer and his predecessors, and I myself, know best, having spent the bulk of our intelligence careers there.

2. Jack Davis served with the Directorate of Intelligence (DI), the National Intelligence Council, and the Office of Training during his CIA career. He is now an independent contractor who specializes in developing and teaching analytic tradecraft. Among his publications is *Uncertainty, Surprise, and Warning* (1996).

Leading Contributors to Quality of Analysis

Intelligence analysts, in seeking to make sound judgments, are always under challenge from the complexities of the issues they address and from the demands made on them for timeliness and volume of production. Four Agency individuals over the decades stand out for having made major contributions on how to deal with these challenges to the quality of analysis.

My short list of the people who have had the greatest positive impact on CIA analysis consists of Sherman Kent, Robert Gates, Douglas MacEachin, and Richards Heuer. My selection methodology was simple. I asked myself: Whose insights have influenced me the most during my four decades of practicing, teaching, and writing about analysis?

Sherman Kent

Sherman Kent's pathbreaking contributions to analysis cannot be done justice in a couple of paragraphs, and I refer readers to fuller treatments elsewhere.[3] Here I address his general legacy to the analytical profession.

Kent, a professor of European history at Yale, worked in the Research and Analysis branch of the Office of Strategic Services during World War II. He wrote an influential book, *Strategic Intelligence for American World Power,* while at the National War College in the late 1940s. He served as Vice Chairman and then as Chairman of the DCI's Board of National Estimates from 1950 to 1967.

Kent's greatest contribution to the quality of analysis was to define an honorable place for the analyst—the thoughtful individual "applying the instruments of reason and the scientific method"—in an intelligence world then as now dominated by collectors and operators. In a second (1965) edition of *Strategic Intelligence,* Kent took account of the coming computer age as well as human and technical collectors in proclaiming the centrality of the analyst:

> Whatever the complexities of the puzzles we strive to solve and whatever the sophisticated techniques we may use to collect

3. See, in particular, the editor's unclassified introductory essay and "Tribute" by Harold P. Ford in Donald P. Steury, *Sherman Kent and the Board of National Estimates: Collected Essays* (CIA, Center for the Study of Intelligence, 1994). Hereinafter cited as Steury, *Kent*.

> the pieces and store them, there can never be a time when the thoughtful man can be supplanted as the intelligence device supreme.

More specifically, Kent advocated application of the techniques of "scientific" study of the past to analysis of complex ongoing situations and estimates of likely future events. Just as rigorous "impartial" analysis could cut through the gaps and ambiguities of information on events long past and point to the most probable explanation, he contended, the powers of the critical mind could turn to events that had not yet transpired to determine the most probable developments.[4]

To this end, Kent developed the concept of the analytic pyramid, featuring a wide base of factual information and sides comprised of sound assumptions, which pointed to the most likely future scenario at the apex.[5]

In his proselytizing and in practice, Kent battled against bureaucratic and ideological biases, which he recognized as impediments to sound analysis, and against imprecise estimative terms that he saw as obstacles to conveying clear messages to readers. Although he was aware of what is now called cognitive bias, his writings urge analysts to "make the call" without much discussion of how limitations of the human mind were to be overcome.

Not many Agency analysts read Kent nowadays. But he had a profound impact on earlier generations of analysts and managers, and his work continues to exert an indirect influence among practitioners of the analytic profession.

Robert Gates

Bob Gates served as Deputy Director of Central Intelligence (1986–1989) and as DCI (1991–1993). But his greatest impact on the quality of CIA analysis came during his 1982–1986 stint as Deputy Director for Intelligence (DDI).

4. Sherman Kent, *Writing History*, second edition (1967). The first edition was published in 1941, when Kent was an assistant professor of history at Yale. In the first chapter, "Why History," he presented ideas and recommendations that he later adapted for intelligence analysis.
5. Kent, "Estimates and Influence" (1968), in Steury, *Kent*.

Initially schooled as a political scientist, Gates earned a Ph.D. in Soviet studies at Georgetown while working as an analyst at CIA. As a member of the National Security Council staff during the 1970s, he gained invaluable insight into how policymakers use intelligence analysis. Highly intelligent, exceptionally hard-working, and skilled in the bureaucratic arts, Gates was appointed DDI by DCI William Casey in good part because he was one of the few insiders Casey found who shared the DCI's views on what Casey saw as glaring deficiencies of Agency analysts.[6] Few analysts and managers who heard it have forgotten Gates' blistering criticism of analytic performance in his 1982 "inaugural" speech as DDI.

Most of the public commentary on Gates and Agency analysis concerned charges of politicization levied against him, and his defense against such charges, during Senate hearings for his 1991 confirmation as DCI. The heat of this debate was slow to dissipate among CIA analysts, as reflected in the pages of *Studies in Intelligence,* the Agency journal founded by Sherman Kent in the 1950s.[7]

I know of no written retrospective on Gates' contribution to Agency analysis. My insights into his ideas about analysis came mostly through an arms-length collaboration in setting up and running an Agency training course entitled "Seminar on Intelligence Successes and Failures."[8] During his tenure as DDI, only rarely could you hold a conversation with analysts or managers without picking up additional viewpoints, thoughtful and otherwise, on what Gates was doing to change CIA analysis.

Gates's ideas for overcoming what he saw as insular, flabby, and incoherent argumentation featured the importance of distinguishing between what analysts know and what they believe—that is, to make clear what is "fact" (or reliably reported information) and what is the analyst's opinion (which had to be persuasively supported with evidence). Among his other tenets were the need to seek the views of non-CIA experts, in-

6. Casey, very early in his tenure as DCI (1981-1987), opined to me that the trouble with Agency analysts is that they went from sitting on their rear ends at universities to sitting on their rear ends at CIA, without seeing the real world.

7. "The Gates Hearings: Politicization and Soviet Analysis at CIA", *Studies in Intelligence* (Spring 1994). "Communication to the Editor: The Gates Hearings: A Biased Account," *Studies in Intelligence* (Fall 1994).

8. DCI Casey requested that the Agency's training office provide this seminar so that, at the least, analysts could learn from their own mistakes. DDI Gates carefully reviewed the statement of goals for the seminar, the outline of course units, and the required reading list.

cluding academic specialists and policy officials, and to present alternate future scenarios.

Gates's main impact, though, came from practice—from his direct involvement in implementing his ideas. Using his authority as DDI, he reviewed critically almost all in-depth assessments and current intelligence articles *prior to publication.* With help from his deputy and two rotating assistants from the ranks of rising junior managers, Gates raised the standards for DDI review dramatically—in essence, from "looks good to me" to "show me your evidence."

As the many drafts Gates rejected were sent back to managers who had approved them—accompanied by the DDI's comments about inconsistency, lack of clarity, substantive bias, and poorly supported judgments—the whole chain of review became much more rigorous. Analysts and their managers raised their standards to avoid the pain of DDI rejection. Both career advancement and ego were at stake.

The rapid and sharp increase in attention paid by analysts and managers to the underpinnings for their substantive judgments probably was without precedent in the Agency's history. The longer term benefits of the intensified review process were more limited, however, because insufficient attention was given to clarifying *tradecraft* practices that would promote analytic soundness. More than one participant in the process observed that a lack of guidelines for meeting Gates's standards led to a large amount of "wheel-spinning."

Gates's impact, like Kent's, has to be seen on two planes. On the one hand, little that Gates wrote on the craft of analysis is read these days. But even though his pre-publication review process was discontinued under his successors, an enduring awareness of his standards still gives pause at jumping to conclusions to many managers and analysts who experienced his criticism first-hand.

Douglas MacEachin

Doug MacEachin, DDI from 1993 to 1996, sought to provide an essential ingredient for ensuring implementation of sound analytic standards: *corporate tradecraft* standards for analysts. This new tradecraft was aimed in particular at ensuring that sufficient attention would be paid to cognitive challenges in assessing complex issues.

MacEachin set out his views on Agency analytical faults and correctives in *The Tradecraft of Analysis: Challenge and Change in the CIA.*[9] My commentary on his contributions to sound analysis is also informed by a series of exchanges with him in 1994 and 1995.

MacEachin's university major was economics, but he also showed great interest in philosophy. His Agency career—like Gates'—included an extended assignment to a policymaking office. He came away from this experience with new insights on what constitutes "value-added" intelligence usable by policymakers. Subsequently, as CIA's senior manager on arms control issues, he dealt regularly with a cadre of tough-minded policy officials who let him know in blunt terms what worked as effective policy support and what did not.

By the time MacEachin became DDI in 1993, Gates's policy of DDI front-office pre-publication review of nearly all DI analytical studies had been discontinued. MacEachin took a different approach; he read—mostly on weekends—and reflected on numerous already-published DI analytical papers. He did not like what he found. In his words, roughly a third of the papers meant to assist the policymaking process had no discernible argumentation to bolster the credibility of intelligence judgments, and another third suffered from flawed argumentation. This experience, along with pressures on CIA for better analytic performance in the wake of alleged "intelligence failures" concerning Iraq's invasion of Kuwait, prompted his decision to launch a major new effort to raise analytical standards.[10]

MacEachin advocated an approach to structured argumentation called "linchpin analysis," to which he contributed muscular terms designed to overcome many CIA professionals' distaste for academic nomenclature. The standard academic term "key variables" became *drivers.* "Hypotheses" concerning drivers became *linchpins*—assumptions underlying the argument—and these had to be explicitly spelled out. MacEachin also urged that greater attention be paid to analytical processes for alerting policymakers to changes in circumstances that would increase the likelihood of alternative scenarios.

9. Unclassified paper published in 1994 by the Working Group on Intelligence Reform, which had been created in 1992 by the Consortium for the Study of Intelligence, Washington, DC.
10. Discussion between MacEachin and the author of this Introduction, 1994.

MacEachin thus worked to put in place systematic and transparent standards for determining whether analysts had met their responsibilities for critical thinking. To spread understanding and application of the standards, he mandated creation of workshops on linchpin analysis for managers and production of a series of notes on analytical tradecraft. He also directed that the DI's performance on tradecraft standards be tracked and that recognition be given to exemplary assessments. Perhaps most ambitious, he saw to it that instruction on standards for analysis was incorporated into a new training course, "Tradecraft 2000." Nearly all DI managers and analysts attended this course during 1996–97.

As of this writing (early 1999), the long-term staying power of MacEachin's tradecraft initiatives is not yet clear. But much of what he advocated has endured so far. Many DI analysts use variations on his linchpin concept to produce soundly argued forecasts. In the training realm, "Tradecraft 2000" has been supplanted by a new course that teaches the same concepts to newer analysts. But examples of what MacEachin would label as poorly substantiated analysis are still seen. Clearly, ongoing vigilance is needed to keep such analysis from finding its way into DI products.

Richards Heuer

Dick Heuer was—and is—much less well known within the CIA than Kent, Gates, and MacEachin. He has not received the wide acclaim that Kent enjoyed as the father of professional analysis, and he has lacked the bureaucratic powers that Gates and MacEachin could wield as DDIs. But his impact on the quality of Agency analysis arguably has been at least as important as theirs.

Heuer received a degree in philosophy in 1950 from Williams College, where, he notes, he became fascinated with the fundamental epistemological question, "What is truth and how can we know it?" In 1951, while a graduate student at the University of California's Berkeley campus, he was recruited as part of the CIA's buildup during the Korean War. The recruiter was Richard Helms, OSS veteran and rising player in the Agency's clandestine service. Future DCI Helms, according to Heuer, was looking for candidates for CIA employment among recent graduates of Williams College, his own alma mater. Heuer had an added advantage

as a former editor of the college's newspaper, a position Helms had held some 15 years earlier.[11]

In 1975, after 24 years in the Directorate of Operations, Heuer moved to the DI. His earlier academic interest in how we know the truth was rekindled by two experiences. One was his involvement in the controversial case of Soviet KGB defector Yuriy Nosenko. The other was learning new approaches to social science methodology while earning a Master's degree in international relations at the University of Southern California's European campus.

At the time he retired in 1979, Heuer headed the methodology unit in the DI's political analysis office. He originally prepared most of the chapters in this book as individual articles between 1978 and 1986; many of them were written for the DI after his retirement. He has updated the articles and prepared some new material for inclusion in this book.

Heuer's Central Ideas

Dick Heuer's writings make three fundamental points about the cognitive challenges intelligence analysts face:

- The mind is poorly "wired" to deal effectively with both inherent uncertainty (the natural fog surrounding complex, indeterminate intelligence issues) and induced uncertainty (the man-made fog fabricated by denial and deception operations).

- Even increased awareness of cognitive and other "unmotivated" biases, such as the tendency to see information confirming an already-held judgment more vividly than one sees "disconfirming" information, does little by itself to help analysts deal effectively with uncertainty.

- Tools and techniques that gear the analyst's mind to apply higher levels of critical thinking can substantially improve analysis on complex issues on which information is incomplete, ambiguous, and often deliberately distorted. Key examples of such intellectu-

11. Letter to the author of this Introduction, 1998.

al devices include techniques for structuring information, challenging assumptions, and exploring alternative interpretations.

The following passage from Heuer's 1980 article entitled "Perception: Why Can't We See What Is There to be Seen?" shows that his ideas were similar to or compatible with MacEachin's concepts of linchpin analysis.

> Given the difficulties inherent in the human processing of complex information, a prudent management system should:
>
> - Encourage products that (a) clearly delineate their assumptions and chains of inference and (b) specify the degree and source of the uncertainty involved in the conclusions.
>
> - Emphasize procedures that expose and elaborate alternative points of view—analytic debates, devil's advocates, interdisciplinary brainstorming, competitive analysis, intra-office peer review of production, and elicitation of outside expertise.

Heuer emphasizes both the value and the dangers of *mental models,* or *mind-sets.* In the book's opening chapter, entitled "Thinking About Thinking," he notes that:

> [Analysts] construct their own version of "reality" on the basis of information provided by the senses, but this sensory input is mediated by complex mental processes that determine which information is attended to, how it is organized, and the meaning attributed to it. What people perceive, how readily they perceive it, and how they process this information after receiving it are all strongly influenced by past experience, education, cultural values, role requirements, and organizational norms, as well as by the specifics of the information received.
>
> This process may be visualized as perceiving the world through a lens or screen that channels and focuses and thereby may distort the images that are seen. To achieve the clearest possible image . . . analysts need more than information . . . They also

> need to understand the lenses through which this information passes. These lenses are known by many terms—mental models, mind-sets, biases, or analytic assumptions.

In essence, Heuer sees reliance on mental models to simplify and interpret reality as an unavoidable conceptual mechanism for intelligence analysts—often useful, but at times hazardous. What is required of analysts, in his view, is a commitment to *challenge, refine, and challenge again* their own working mental models, precisely because these steps are central to sound interpretation of complex and ambiguous issues.

Throughout the book, Heuer is critical of the orthodox prescription of "more and better information" to remedy unsatisfactory analytic performance. He urges that greater attention be paid instead to more intensive exploitation of information already on hand, and that in so doing, analysts continuously challenge and revise their mental models.

Heuer sees *mirror-imaging* as an example of an unavoidable cognitive trap. No matter how much expertise an analyst applies to interpreting the value systems of foreign entities, when the hard evidence runs out the tendency to project the analyst's own mind-set takes over. In Chapter 4, Heuer observes:

> To see the options faced by foreign leaders as these leaders see them, one must understand their values and assumptions and even their misperceptions and misunderstandings. Without such insight, interpreting foreign leaders' decisions or forecasting future decisions is often nothing more than partially informed speculation. Too frequently, foreign behavior appears "irrational" or "not in their own best interest." Such conclusions often indicate analysts have projected American values and conceptual frameworks onto the foreign leaders and societies, rather than understanding the logic of the situation as it appears to them.

Competing Hypotheses

To offset the risks accompanying analysts' inevitable recourse to mirror-imaging, Heuer suggests looking upon analysts' calculations about

foreign beliefs and behavior as hypotheses to be challenged. Alternative hypotheses need to be carefully considered—especially those that cannot be *disproved* on the basis of available information.

Heuer's concept of "Analysis of Competing Hypotheses" (ACH) is among his most important contributions to the development of an intelligence analysis methodology. At the core of ACH is the notion of competition among a series of plausible hypotheses to see which ones survive a gauntlet of testing for compatibility with available information. The surviving hypotheses—those that have not been disproved—are subjected to further testing. ACH, Heuer concedes, will not always yield the right answer. But it can help analysts overcome the cognitive limitations discussed in his book.

Some analysts who use ACH follow Heuer's full eight-step methodology. More often, they employ some elements of ACH—especially the use of available information to challenge the hypotheses that the analyst favors the most.

Denial and Deception

Heuer's path-breaking work on countering denial and deception (D&D) was not included as a separate chapter in this volume. But his brief references here are persuasive.

He notes, for example, that analysts often reject the possibility of deception because they see no evidence of it. He then argues that rejection is not justified under these circumstances. If deception is well planned and properly executed, one should not expect to see evidence of it readily at hand. Rejecting a plausible but unproven hypothesis too early tends to bias the subsequent analysis, because one does not then look for the evidence that might support it. The possibility of deception should not be rejected until it is disproved or, at least, until a systematic search for evidence has been made and none has been found.

Heuer's Impact

Heuer's influence on analytic tradecraft began with his first articles. CIA officials who set up training courses in the 1980s as part of then-DDI Gates's quest for improved analysis shaped their lesson plans partly on the basis of Heuer's findings. Among these courses were a seminar on intelligence successes and failures and another on intelligence analysis.

The courses influenced scores of DI analysts, many of whom are now in the managerial ranks. The designers and teachers of Tradecraft 2000 clearly were also influenced by Heuer, as reflected in reading selections, case studies, and class exercises.

Heuer's work has remained on reading lists and in lesson plans for DI training courses offered to all new analysts, as well as courses on warning analysis and on countering denial and deception. Senior analysts and managers who have been directly exposed to Heuer's thinking through his articles, or through training courses, continue to pass his insights on to newer analysts.

Recommendations

Heuer's advice to Agency leaders, managers, and analysts is pointed: To ensure sustained improvement in assessing complex issues, analysis must be treated as more than a substantive and organizational process. Attention also must be paid to techniques and tools for coping with the inherent limitations on analysts' mental machinery. He urges that Agency leaders take steps to:

- *Establish an organizational environment* that promotes and rewards the kind of critical thinking he advocates—or example, analysis on difficult issues that considers in depth a series of plausible hypotheses rather than allowing the first credible hypothesis to suffice.

- *Expand funding for research* on the role such mental processes play in shaping analytical judgments. An Agency that relies on sharp cognitive performance by its analysts must stay abreast of studies on how the mind works—i.e., on *how* analysts reach judgments.

- *Foster development of tools* to assist analysts in assessing information. On tough issues, they need help in improving their mental models and in deriving incisive findings from information they already have; they need such help at least as much as they need more information.

I offer some concluding observations and recommendations, rooted in Heuer's findings and taking into account the tough tradeoffs facing intelligence professionals:

- *Commit to a uniform set of tradecraft standards based on the insights in this book.* Leaders need to know if analysts have done their cognitive homework before taking corporate responsibility for their judgments. Although every analytical issue can be seen as one of a kind, I suspect that nearly all such topics fit into about a dozen recurring patterns of challenge based largely on variations in substantive uncertainty and policy sensitivity. Corporate standards need to be established for each such category. And the burden should be put on managers to explain why a given analytical assignment requires deviation from the standards. I am convinced that if tradecraft standards are made uniform and transparent, the time saved by curtailing personalistic review of quick-turnaround analysis (e.g., "It reads better to me this way") could be "re-invested" in doing battle more effectively against cognitive pitfalls. ("Regarding point 3, let's talk about your assumptions.")

- *Pay more honor to "doubt."* Intelligence leaders and policymakers should, in recognition of the cognitive impediments to sound analysis, establish ground rules that enable analysts, after doing their best to clarify an issue, to express doubts more openly. They should be encouraged to list gaps in information and other obstacles to confident judgment. Such conclusions as "We do not know" or "There are several potentially valid ways to assess this issue" should be regarded as badges of sound analysis, not as dereliction of analytic duty.

- *Find a couple of successors to Dick Heuer. Fund their research. Heed their findings.*

PART I—OUR MENTAL MACHINERY

Chapter 1

Thinking About Thinking

Of the diverse problems that impede accurate intelligence analysis, those inherent in human mental processes are surely among the most important and most difficult to deal with. Intelligence analysis is fundamentally a mental process, but understanding this process is hindered by the lack of conscious awareness of the workings of our own minds.

A basic finding of cognitive psychology is that people have no conscious experience of most of what happens in the human mind. Many functions associated with perception, memory, and information processing are conducted prior to and independently of any conscious direction. What appears spontaneously in consciousness is the result of thinking, not the process of thinking.

Weaknesses and biases inherent in human thinking processes can be demonstrated through carefully designed experiments. They can be alleviated by conscious application of tools and techniques that should be in the analytical tradecraft toolkit of all intelligence analysts.

* * * * * * * * * * * * * * * * * * * *

"When we speak of improving the mind we are usually referring to the acquisition of information or knowledge, or to the type of thoughts one should have, and not to the actual functioning of the mind. We spend little time monitoring our own thinking and comparing it with a more sophisticated ideal."[12]

When we speak of improving intelligence analysis, we are usually referring to the quality of writing, types of analytical products, relations between intelligence analysts and intelligence consumers, or organization

12. James L. Adams, *Conceptual Blockbusting: A Guide to Better Ideas* (New York: W.W. Norton, second edition, 1980), p. 3.

of the analytical process. Little attention is devoted to improving how analysts think.

Thinking analytically is a skill like carpentry or driving a car. It can be taught, it can be learned, and it can improve with practice. But like many other skills, such as riding a bike, it is not learned by sitting in a classroom and being told how to do it. Analysts learn by doing. Most people achieve at least a minimally acceptable level of analytical performance with little conscious effort beyond completing their education. With much effort and hard work, however, analysts can achieve a level of excellence beyond what comes naturally.

Regular running enhances endurance but does not improve technique without expert guidance. Similarly, expert guidance may be required to modify long-established analytical habits to achieve an optimal level of analytical excellence. An analytical coaching staff to help young analysts hone their analytical tradecraft would be a valuable supplement to classroom instruction.

One key to successful learning is motivation. Some of CIA's best analysts developed their skills as a consequence of experiencing analytical failure early in their careers. Failure motivated them to be more self-conscious about how they do analysis and to sharpen their thinking process.

This book aims to help intelligence analysts achieve a higher level of performance. It shows how people make judgments based on incomplete and ambiguous information, and it offers simple tools and concepts for improving analytical skills.

Part I identifies some limitations inherent in human mental processes. Part II discusses analytical tradecraft—simple tools and approaches for overcoming these limitations and thinking more systematically. Chapter 8, "Analysis of Competing Hypotheses," is arguably the most important single chapter. Part III presents information about cognitive biases—the technical term for predictable mental errors caused by simplified information processing strategies. A final chapter presents a checklist for analysts and recommendations for how managers of intelligence analysis can help create an environment in which analytical excellence flourishes.

Herbert Simon first advanced the concept of "bounded" or limited rationality.[13] Because of limits in human mental capacity, he argued, the

13. Herbert Simon, *Models of Man*, 1957.

mind cannot cope directly with the complexity of the world. Rather, we construct a simplified mental model of reality and then work with this model. We behave rationally within the confines of our mental model, but this model is not always well adapted to the requirements of the real world. The concept of bounded rationality has come to be recognized widely, though not universally, both as an accurate portrayal of human judgment and choice and as a sensible adjustment to the limitations inherent in how the human mind functions.[14]

Much psychological research on perception, memory, attention span, and reasoning capacity documents the limitations in our "mental machinery" identified by Simon. Many scholars have applied these psychological insights to the study of international political behavior.[15] A similar psychological perspective underlies some writings on intelligence failure and strategic surprise.[16]

This book differs from those works in two respects. It analyzes problems from the perspective of intelligence analysts rather than policymakers. And it documents the impact of mental processes largely through

experiments in cognitive psychology rather than through examples from diplomatic and military history.

A central focus of this book is to illuminate the role of the observer in determining what is observed and how it is interpreted. People construct their own version of "reality" on the basis of information provided by the senses, but this sensory input is mediated by complex mental processes that determine which information is attended to, how it is organized, and the meaning attributed to it. What people perceive, how readily they perceive it, and how they process this information after receiving it are all strongly influenced by past experience, education, cultural values, role requirements, and organizational norms, as well as by the specifics of the information received.

This process may be visualized as perceiving the world through a lens or screen that channels and focuses and thereby may distort the images that are seen. To achieve the clearest possible image of China, for example, analysts need more than information on China. They also need to understand their own lenses through which this information passes. These lenses are known by many terms—mental models, mind-sets, biases, or analytical assumptions.

In this book, the terms mental model and mind-set are used more or less interchangeably, although a mental model is likely to be better developed and articulated than a mind-set. An analytical assumption is one part of a mental model or mind-set. The biases discussed in this book result from how the mind works and are independent of any substantive mental model or mind-set.

Before obtaining a license to practice, psychoanalysts are required to undergo psychoanalysis themselves in order to become more aware of how their own personality interacts with and conditions their observations of others. The practice of psychoanalysis has not been so successful that its procedures should be emulated by the intelligence and foreign policy community. But the analogy highlights an interesting point: Intelligence analysts must understand themselves before they can understand others. Training is needed to (a) increase self-awareness concerning generic problems in how people perceive and make analytical judgments concerning foreign events, and (b) provide guidance and practice in overcoming these problems.

Not enough training is focused in this direction—that is, inward toward the analyst's own thought processes. Training of intelligence ana-

lysts generally means instruction in organizational procedures, methodological techniques, or substantive topics. More training time should be devoted to the mental act of thinking or analyzing. It is simply assumed, incorrectly, that analysts know how to analyze. This book is intended to support training that examines the thinking and reasoning processes involved in intelligence analysis.

As discussed in the next chapter, mind-sets and mental models are inescapable. They are, in essence, a distillation of all that we think we know about a subject. The problem is how to ensure that the mind remains open to alternative interpretations in a rapidly changing world.

The disadvantage of a mind-set is that it can color and control our perception to the extent that an experienced specialist may be among the last to see what is really happening when events take a new and unexpected turn. When faced with a major paradigm shift, analysts who know the most about a subject have the most to unlearn. This seems to have happened before the reunification of Germany, for example. Some German specialists had to be prodded by their more generalist supervisors to accept the significance of the dramatic changes in progress toward reunification of East and West Germany.

The advantage of mind-sets is that they help analysts get the production out on time and keep things going effectively between those watershed events that become chapter headings in the history books.[17]

A generation ago, few intelligence analysts were self-conscious and introspective about the process by which they did analysis. The accepted wisdom was the "common sense" theory of knowledge—that to perceive events accurately it was necessary only to open one's eyes, look at the facts, and purge oneself of all preconceptions and prejudices in order to make an objective judgment.

Today, there is greatly increased understanding that intelligence analysts do not approach their tasks with empty minds. They start with a set of assumptions about how events normally transpire in the area for which they are responsible. Although this changed view is becoming conventional wisdom, the Intelligence Community has only begun to scratch the surface of its implications.

If analysts' understanding of events is greatly influenced by the mind-set or mental model through which they perceive those events,

17. This wording is from a discussion with veteran CIA analyst, author, and teacher Jack Davis.

should there not be more research to explore and document the impact of different mental models?[18]

The reaction of the Intelligence Community to many problems is to collect more information, even though analysts in many cases already have more information than they can digest. What analysts need is more truly useful information—mostly reliable HUMINT from knowledgeable insiders—to help them make good decisions. Or they need a more accurate mental model and better analytical tools to help them sort through, make sense of, and get the most out of the available ambiguous and conflicting information.

Psychological research also offers to intelligence analysts additional insights that are beyond the scope of this book. Problems are not limited to how analysts perceive and process information. Intelligence analysts often work in small groups and always within the context of a large, bureaucratic organization. Problems are inherent in the processes that occur at all three levels—individual, small group, and organization. This book focuses on problems inherent in analysts' mental processes, inasmuch as these are probably the most insidious. Analysts can observe and get a feel for these problems in small-group and organizational processes, but it is very difficult, at best, to be self-conscious about the workings of one's own mind.

18. Graham Allison's work on the Cuban missile crisis (*Essence of Decision*, Little, Brown & Co., 1971) is an example of what I have in mind. Allison identified three alternative assumptions about how governments work--a rational actor model, an organizational process model, and a bureaucratic politics model. He then showed how an analyst's implicit assumptions about the most appropriate model for analyzing a foreign government's behavior can cause him or her to focus on different evidence and arrive at different conclusions. Another example is my own analysis of five alternative paths for making counterintelligence judgments in the controversial case of KGB defector Yuriy Nosenko: Richards J. Heuer, Jr., "Nosenko: Five Paths to Judgment," *Studies in Intelligence*, Vol. 31, No. 3 (Fall 1987), originally classified Secret but declassified and published in H. Bradford Westerfield, ed., *Inside CIA's Private World: Declassified Articles from the Agency's Internal Journal 1955-1992* (New Haven: Yale University Press, 1995).

Chapter 2

Perception: Why Can't We See What Is There To Be Seen?

The process of perception links people to their environment and is critical to accurate understanding of the world about us. Accurate intelligence analysis obviously requires accurate perception. Yet research into human perception demonstrates that the process is beset by many pitfalls. Moreover, the circumstances under which intelligence analysis is conducted are precisely the circumstances in which accurate perception tends to be most difficult. This chapter discusses perception in general, then applies this information to illuminate some of the difficulties of intelligence analysis.[19]

* * * * * * * * * * * * * * * * * * * *

People tend to think of perception as a passive process. We see, hear, smell, taste or feel stimuli that impinge upon our senses. We think that if we are at all objective, we record what is actually there. Yet perception is demonstrably an active rather than a passive process; it constructs rather than records "reality." Perception implies understanding as well as awareness. It is a process of inference in which people construct their own version of reality on the basis of information provided through the five senses.

As already noted, what people in general and analysts in particular perceive, and how readily they perceive it, are strongly influenced by their past experience, education, cultural values, and role requirements, as well as by the stimuli recorded by their receptor organs.

Many experiments have been conducted to show the extraordinary extent to which the information obtained by an observer depends upon the observer's own assumptions and preconceptions. For example, when

19. An earlier version of this article was published as part of "Cognitive Factors in Deception and Counterdeception," in Donald C. Daniel and Katherine L. Herbig, eds., *Strategic Military Deception* (Pergamon Press, 1982).

Figure 1

you looked at Figure 1 above, what did you see? Now refer to the footnote for a description of what is actually there.[20] Did you perceive Figure 1 correctly? If so, you have exceptional powers of observation, were lucky, or have seen the figure before. This simple experiment demonstrates one of the most fundamental principles concerning perception:

We tend to perceive what we expect to perceive.

A corollary of this principle is that it takes more information, and more unambiguous information, to recognize an unexpected phenomenon than an expected one.

One classic experiment to demonstrate the influence of expectations on perception used playing cards, some of which were gimmicked so the spades were red and the hearts black. Pictures of the cards were flashed briefly on a screen and, needless to say, the test subjects identified the normal cards more quickly and accurately than the anomalous ones. After test subjects became aware of the existence of red spades and black hearts, their performance with the gimmicked cards improved but still did not approach the speed or accuracy with which normal cards could be identified.[21]

20. The article is written twice in each of the three phrases. This is commonly overlooked because perception is influenced by our expectations about how these familiar phrases are normally written.

21. Jerome S. Bruner and Leo Postman, "On the Perception of Incongruity: A Paradigm," in Jerome S. Bruner and David Kraut, eds., *Perception and Personality: A Symposium* (New York: Greenwood Press, 1968).

This experiment shows that patterns of expectation become so deeply embedded that they continue to influence perceptions even when people are alerted to and try to take account of the existence of data that do not fit their preconceptions. Trying to be objective does not ensure accurate perception.

The position of the test subject identifying playing cards is analogous to that of the intelligence analyst or government leader trying to make sense of the paper flow that crosses his or her desk. What is actually perceived in that paper flow, as well as how it is interpreted, depends in part, at least, on the analyst's patterns of expectation. Analysts do not just have expectations about the color of hearts and spades. They have a set of assumptions and expectations about the motivations of people and the processes of government in foreign countries. Events consistent with these expectations are perceived and processed easily, while events that contradict prevailing expectations tend to be ignored or distorted in perception. Of course, this distortion is a subconscious or pre-conscious process, as illustrated by how you presumably ignored the extra words in the triangles in Figure 1.

This tendency of people to perceive what they *expect* to perceive is more important than any tendency to perceive what they *want* to perceive. In fact, there may be no real tendency toward wishful thinking. The commonly cited evidence supporting the claim that people tend to perceive what they want to perceive can generally be explained equally well by the expectancy thesis.[22]

Expectations have many diverse sources, including past experience, professional training, and cultural and organizational norms. All these influences predispose analysts to pay particular attention to certain kinds of information and to organize and interpret this information in certain ways. Perception is also influenced by the context in which it occurs. Different circumstances evoke different sets of expectations. People are more attuned to hearing footsteps behind them when walking in an alley at night than along a city street in daytime, and the meaning attributed to the sound of footsteps will vary under these differing circumstances. A military intelligence analyst may be similarly tuned to perceive indicators of potential conflict.

22. For discussion of the ambiguous evidence concerning the impact of desires and fears on judgment, see Robert Jervis, *Perception and Misperception in International Politics* (Princeton, NJ: Princeton University Press, 1976), Chapter 10.

Patterns of expectations tell analysts, subconsciously, what to look for, what is important, and how to interpret what is seen. These patterns form a mind-set that predisposes analysts to think in certain ways. A mind-set is akin to a screen or lens through which one perceives the world.

There is a tendency to think of a mind-set as something bad, to be avoided. According to this line of argument, one should have an open mind and be influenced only by the facts rather than by preconceived notions! That is an unreachable ideal. There is no such thing as "the facts of the case." There is only a very selective subset of the overall mass of data to which one has been subjected that one takes as facts and judges to be relevant to the question at issue.

Actually, mind-sets are neither good nor bad; they are unavoidable. People have no conceivable way of coping with the volume of stimuli that impinge upon their senses, or with the volume and complexity of the data they have to analyze, without some kind of simplifying preconceptions about what to expect, what is important, and what is related to what. "There is a grain of truth in the otherwise pernicious maxim that an open mind is an empty mind."[23] Analysts do not achieve objective analysis by avoiding preconceptions; that would be ignorance or self-delusion. Objectivity is achieved by making basic assumptions and reasoning as explicit as possible so that they can be challenged by others and analysts can, themselves, examine their validity.

One of the most important characteristics of mind-sets is:

Mind-sets tend to be quick to form but resistant to change.

Figure 2 illustrates this principle by showing part of a longer series of progressively modified drawings that change almost imperceptibly from a man into a woman.[24] The right-hand drawing in the top row, when viewed alone, has equal chances of being perceived as a man or a woman. When test subjects are shown the entire series of drawings one by one, their perception of this intermediate drawing is biased according to which end of the series they started from. Test subjects who start by viewing a picture that is clearly a man are biased in favor of continuing

24. Drawings devised by Gerald Fisher in 1967.

Figure 2

Impressions resist change.

to see a man long after an "objective observer" (for example, an observer who has seen only a single picture) recognizes that the man is now a woman. Similarly, test subjects who start at the woman end of the series are biased in favor of continuing to see a woman. Once an observer has formed an image—that is, once he or she has developed a mind-set or expectation concerning the phenomenon being observed—this conditions future perceptions of that phenomenon.

This is the basis for another general principle of perception:

New information is assimilated to existing images.

This principle explains why gradual, evolutionary change often goes unnoticed. It also explains the phenomenon that an intelligence analyst assigned to work on a topic or country for the first time may generate accurate insights that have been overlooked by experienced analysts who have worked on the same problem for 10 years. A fresh perspective is sometimes useful; past experience can handicap as well as aid analysis. This tendency to assimilate new data into pre-existing images is greater "the more ambiguous the information, the more confident the actor is of

Figure 3

It is difficult to look at the same information from different perspectives.

the validity of his image, and the greater his commitment to the established view."[25]

The drawing in Figure 3 provides the reader an opportunity to test for him or herself the persistence of established images.[26] Look at Figure 3. What do you see—an old woman or a young woman? Now look again to see if you can visually and mentally reorganize the data to form a different image—that of a young woman if your original perception was of an old woman, or of the old woman if you first perceived the young one. If necessary, look at the footnote for clues to help you identify the other

25. Jervis, p. 195.
26. This picture was originally published in *Puck* magazine in 1915 as a cartoon entitled "My Wife and My Mother-in-Law."

image.[27] Again, this exercise illustrates the principle that mind-sets are quick to form but resistant to change.

When you have seen Figure 3 from *both* perspectives, try shifting back and forth from one perspective to the other. Do you notice some initial difficulty in making this switch? One of the more difficult mental feats is to take a familiar body of data and reorganize it visually or mentally to perceive it from a different perspective. Yet this is what intelligence analysts are constantly required to do. In order to understand international interactions, analysts must understand the situation as it appears to each of the opposing forces, and constantly shift back and forth from one perspective to the other as they try to fathom how each side interprets an ongoing series of interactions. Trying to perceive an adversary's interpretations of international events, as well as US interpretations of those same events, is comparable to seeing both the old and young woman in Figure 3. Once events have been perceived one way, there is a natural resistance to other perspectives.

A related point concerns the impact of substandard conditions of perception. The basic principle is:

> **Initial exposure to blurred or ambiguous stimuli interferes with accurate perception even after more and better information becomes available.**

This effect has been demonstrated experimentally by projecting onto a screen pictures of common, everyday subjects such as a dog standing on grass, a fire hydrant, and an aerial view of a highway cloverleaf intersection.[28] The initial projection was blurred in varying degrees, and the pictures were then brought into focus slowly to determine at what point test subjects could identify them correctly.

This experiment showed two things. First, those who started viewing the pictures when they were most out of focus had more difficulty identifying them when they became clearer than those who started view-

27. The old woman's nose, mouth, and eye are, respectively, the young woman's chin, necklace, and ear. The old woman is seen in profile looking left. The young woman is also looking left, but we see her mainly from behind so most facial features are not visible. Her eyelash, nose, and the curve of her cheek may be seen just above the old woman's nose.
28. Jerome S. Bruner and Mary C. Potter, "Interference in Visual Recognition," *Science*, Vol. 144 (1964), pp. 424-25.

ing at a less blurred stage. In other words, the greater the initial blur, the clearer the picture had to be before people could recognize it. Second, the longer people were exposed to a blurred picture, the clearer the picture had to be before they could recognize it.

What happened in this experiment is what presumably happens in real life; despite ambiguous stimuli, people form some sort of tentative hypothesis about what they see. The longer they are exposed to this blurred image, the greater confidence they develop in this initial and perhaps erroneous impression, so the greater the impact this initial impression has on subsequent perceptions. For a time, as the picture becomes clearer, there is no *obvious* contradiction; the new data are assimilated into the previous image, and the initial interpretation is maintained until the contradiction becomes so obvious that it forces itself upon our consciousness.

The early but incorrect impression tends to persist because the amount of information necessary to invalidate a hypothesis is considerably greater than the amount of information required to make an initial interpretation. The problem is not that there is any inherent difficulty in grasping new perceptions or new ideas, but that established perceptions are so difficult to change. People form impressions on the basis of very little information, but once formed, they do not reject or change them unless they obtain rather solid evidence. Analysts might seek to limit the adverse impact of this tendency by suspending judgment for as long as possible as new information is being received.

Implications for Intelligence Analysis

Comprehending the nature of perception has significant implications for understanding the nature and limitations of intelligence analysis. The circumstances under which accurate perception is most difficult are exactly the circumstances under which intelligence analysis is generally conducted—dealing with highly ambiguous situations on the basis of information that is processed incrementally under pressure for early judgment. This is a recipe for inaccurate perception.

Intelligence seeks to illuminate the unknown. Almost by definition, intelligence analysis deals with highly ambiguous situations. As previously noted, the greater the ambiguity of the stimuli, the greater the impact of expectations and pre-existing images on the perception of that

stimuli. Thus, despite maximum striving for objectivity, the intelligence analyst's own preconceptions are likely to exert a greater impact on the analytical product than in other fields where an analyst is working with less ambiguous and less discordant information.

Moreover, the intelligence analyst is among the first to look at new problems at an early stage when the evidence is very fuzzy indeed. The analyst then follows a problem as additional increments of evidence are received and the picture gradually clarifies—as happened with test subjects in the experiment demonstrating that initial exposure to blurred stimuli interferes with accurate perception even after more and better information becomes available. If the results of this experiment can be generalized to apply to intelligence analysts, the experiment suggests that an analyst who starts observing a potential problem situation at an early and unclear stage is at a disadvantage as compared with others, such as policymakers, whose first exposure may come at a later stage when more and better information is available.

The receipt of information in small increments over time also facilitates assimilation of this information into the analyst's existing views. No one item of information may be sufficient to prompt the analyst to change a previous view. The cumulative message inherent in many pieces of information may be significant but is attenuated when this information is not examined as a whole. The Intelligence Community's review of its performance before the 1973 Arab-Israeli War noted:

> The problem of incremental analysis—especially as it applies to the current intelligence process—was also at work in the period preceding hostilities. Analysts, according to their own accounts, were often proceeding on the basis of the day's take, hastily comparing it with material received the previous day. They then produced in 'assembly line fashion' items which may have reflected perceptive intuition but which [did not] accrue from a systematic consideration of an accumulated body of integrated evidence.[29]

And finally, the intelligence analyst operates in an environment that exerts strong pressures for what psychologists call premature closure.

29. *The Performance of the Intelligence Community Before the Arab-Israeli War of October 1973: A Preliminary Post-Mortem Report,* December 1973. The one-paragraph excerpt from this post-mortem, as quoted in the text above, has been approved for public release, as was the title of the post-mortem, although that document as a whole remains classified.

Customer demand for interpretive analysis is greatest within two or three days after an event occurs. The system requires the intelligence analyst to come up with an almost instant diagnosis before sufficient hard information, and the broader background information that may be needed to gain perspective, become available to make possible a well-grounded judgment. This diagnosis can only be based upon the analyst's preconceptions concerning how and why events normally transpire in a given society.

As time passes and more information is received, a fresh look at all the evidence might suggest a different explanation. Yet, the perception experiments indicate that an early judgment adversely affects the formation of future perceptions. Once an observer thinks he or she knows what is happening, this perception tends to resist change. New data received incrementally can be fit easily into an analyst's previous image. This perceptual bias is reinforced by organizational pressures favoring consistent interpretation; once the analyst is committed in writing, both the analyst and the organization have a vested interest in maintaining the original assessment.

That intelligence analysts perform as well as they do is testimony to their generally sound judgment, training, and dedication in performing a dauntingly difficult task.

The problems outlined here have implications for the management as well as the conduct of analysis. Given the difficulties inherent in the human processing of complex information, a prudent management system should:

- Encourage products that clearly delineate their assumptions and chains of inference and that specify the degree and source of uncertainty involved in the conclusions.
- Support analyses that periodically re-examine key problems from the ground up in order to avoid the pitfalls of the incremental approach.
- Emphasize procedures that expose and elaborate alternative points of view.
- Educate consumers about the limitations as well as the capabilities of intelligence analysis; define a set of realistic expectations as a standard against which to judge analytical performance.

Chapter 3

Memory: How Do We Remember What We Know?

Differences between stronger and weaker analytical performance are attributable in large measure to differences in the organization of data and experience in analysts' long-term memory. The contents of memory form a continuous input into the analytical process, and anything that influences what information is remembered or retrieved from memory also influences the outcome of analysis.

This chapter discusses the capabilities and limitations of several components of the memory system. Sensory information storage and short-term memory are beset by severe limitations of capacity, while long-term memory, for all practical purposes, has a virtually infinite capacity. With long-term memory, the problems concern getting information into it and retrieving information once it is there, not physical limits on the amount of information that may be stored. Understanding how memory works provides insight into several analytical strengths and weaknesses.

* * * * * * * * * * * * * * * * * * * *

Components of the Memory System

What is commonly called memory is not a single, simple function. It is an extraordinarily complex system of diverse components and processes. There are at least three, and very likely more, distinct memory processes. The most important from the standpoint of this discussion and best documented by scientific research are sensory information stor-

age (SIS), short-term memory (STM), and long-term memory (LTM).[30] Each differs with respect to function, the form of information held, the length of time information is retained, and the amount of information-handling capacity. Memory researchers also posit the existence of an interpretive mechanism and an overall memory monitor or control mechanism that guides interaction among various elements of the memory system.

Sensory Information Storage

Sensory information storage holds sensory images for several tenths of a second after they are received by the sensory organs. The functioning of SIS may be observed if you close your eyes, then open and close them again as rapidly as possible. As your eyes close, notice how the visual image is maintained for a fraction of a second before fading. Sensory information storage explains why a movie film shot at 16 separate frames per second appears as continuous movement rather than a series of still pictures. A visual trace is generally retained in SIS for about one-quarter of a second. It is not possible to consciously extend the time that sensory information is held in SIS. The function of SIS is to make it possible for the brain to work on processing a sensory event for longer than the duration of the event itself.

Short-Term Memory

Information passes from SIS into short-term memory, where again it is held for only a short period of time—a few seconds or minutes. Whereas SIS holds the complete image, STM stores only the interpretation of the image. If a sentence is spoken, SIS retains the sounds, while STM holds the words formed by these sounds.

Like SIS, short-term memory holds information temporarily, pending further processing. This processing includes judgments concerning meaning, relevance, and significance, as well as the mental actions necessary to integrate selected portions of the information into long-term

30. Memory researchers do not employ uniform terminology. Sensory information storage is also known as sensory register, sensory store, and eidetic and echoic memory. Short- and long-term memory are also referred to as primary and secondary memory. A variety of other terms are in use as well. I have adopted the terminology used by Peter H. Lindsay and Donald A. Norman in their text on *Human Information Processing* (New York: Academic Press, 1977). This entire chapter draws heavily from Chapters 8 through 11 of the Lindsay and Norman book.

memory. When a person forgets immediately the name of someone to whom he or she has just been introduced, it is because the name was not transferred from short-term to long-term memory.

A central characteristic of STM is the severe limitation on its capacity. A person who is asked to listen to and repeat a series of 10 or 20 names or numbers normally retains only five or six items. Commonly it is the last five or six. If one focuses instead on the first items, STM becomes saturated by this effort, and the person cannot concentrate on and recall the last items. People make a choice where to focus their attention. They can concentrate on remembering or interpreting or taking notes on information received moments ago, or pay attention to information currently being received. Limitations on the capacity of short-term memory often preclude doing both.

Retrieval of information from STM is direct and immediate because the information has never left the conscious mind. Information can be maintained in STM indefinitely by a process of "rehearsal"—repeating it over and over again. But while rehearsing some items to retain them in STM, people cannot simultaneously add new items. The severe limitation on the amount of information retainable in STM at any one time is physiological, and there is no way to overcome it. This is an important point that will be discussed below in connection with working memory and the utility of external memory aids.

Long-Term Memory

Some information retained in STM is processed into long-term memory. This information on past experiences is filed away in the recesses of the mind and must be retrieved before it can be used. In contrast to the immediate recall of current experience from STM, retrieval of information from LTM is indirect and sometimes laborious.

Loss of detail as sensory stimuli are interpreted and passed from SIS into STM and then into LTM is the basis for the phenomenon of selective perception discussed in the previous chapter. It imposes limits on subsequent stages of analysis, inasmuch as the lost data can never be retrieved. People can never take their mind back to what was *actually there* in sensory information storage or short-term memory. They can only retrieve their interpretation of what they *thought* was there as stored in LTM.

There are no practical limits to the amount of information that may be stored in LTM. The limitations of LTM are the difficulty of processing information into it and retrieving information from it. These subjects are discussed below.

The three memory processes comprise the storehouse of information or database that we call memory, but the total memory system must include other features as well. Some mental process must determine what information is passed from SIS into STM and from STM into LTM; decide how to search the LTM data base and judge whether further memory search is likely to be productive; assess the relevance of retrieved information; and evaluate potentially contradictory data.

To explain the operation of the total memory system, psychologists posit the existence of an interpretive mechanism that operates on the data base and a monitor or central control mechanism that guides and oversees the operation of the whole system. Little is known of these mechanisms and how they relate to other mental processes.

Despite much research on memory, little agreement exists on many critical points. What is presented here is probably the lowest common denominator on which most researchers would agree.

Organization of Information in Long-Term Memory. Physically, the brain consists of roughly 10 billion neurons, each analogous to a computer chip capable of storing information. Each neuron has octopus-like arms called axons and dendrites. Electrical impulses flow through these arms and are ferried by neurotransmitting chemicals across what is called the synaptic gap between neurons. Memories are stored as patterns of connections between neurons. When two neurons are activated, the connections or "synapses" between them are strengthened.

As you read this chapter, the experience actually causes physical changes in your brain. "In a matter of seconds, new circuits are formed that can change forever the way you think about the world."[31]

Memory records a lifetime of experience and thoughts. Such a massive data retrieval mechanism, like a library or computer system, must have an organizational structure; otherwise information that enters the system could never be retrieved. Imagine the Library of Congress if there were no indexing system.

31. George Johnson, *In the Palaces of Memory: How We Build the Worlds Inside Our Heads.* Vintage Books, 1992, p. xi.

There has been considerable research on how information is organized and represented in memory, but the findings remain speculative. Current research focuses on which sections of the brain process various types of information. This is determined by testing patients who have suffered brain damage from strokes and trauma or by using functional magnetic resonance imaging (fMRI) that "lights up" the active portion of the brain as a person speaks, reads, writes, or listens.

None of the current theories seems to encompass the full range or complexity of memory processes, which include memory for sights and sounds, for feelings, and for belief systems that integrate information on a large number of concepts. However useful the research has been for other purposes, analysts' needs are best served by a very simple image of the structure of memory.

Imagine memory as a massive, multidimensional spider web. This image captures what is, for the purposes of this book, perhaps the most important property of information stored in memory—its interconnectedness. One thought leads to another. It is possible to start at any one point in memory and follow a perhaps labyrinthine path to reach any other point. Information is retrieved by tracing through the network of interconnections to the place where it is stored.

Retrievability is influenced by the number of locations in which information is stored and the number and strength of pathways from this information to other concepts that might be activated by incoming information. The more frequently a path is followed, the stronger that path becomes and the more readily available the information located along that path. If one has not thought of a subject for some time, it may be difficult to recall details. After thinking our way back into the appropriate context and finding the general location in our memory, the interconnections become more readily available. We begin to remember names, places, and events that had seemed to be forgotten.

Once people have started thinking about a problem one way, the same mental circuits or pathways get activated and strengthened each time they think about it. This facilitates the retrieval of information. These same pathways, however, also become the mental ruts that make it difficult to reorganize the information mentally so as to see it from a different perspective. That explains why, in the previous chapter, once you saw the picture of the old woman it was difficult to see the young

woman, or vice versa. A subsequent chapter will consider ways of breaking out of mental ruts.

One useful concept of memory organization is what some cognitive psychologists call a "schema." A schema is *any pattern of relationships* among data stored in memory. It is any set of nodes and links between them in the spider web of memory that hang together so strongly that they can be retrieved and used more or less as a single unit.

For example, a person may have a schema for a bar that when activated immediately makes available in memory knowledge of the properties of a bar and what distinguishes a bar, say, from a tavern. It brings back memories of specific bars that may in turn stimulate memories of thirst, guilt, or other feelings or circumstances. People also have schemata (plural for schema) for abstract concepts such as a socialist economic system and what distinguishes it from a capitalist or communist system. Schemata for phenomena such as success or failure in making an accurate intelligence estimate will include links to those elements of memory that explain typical causes and implications of success or failure. There must also be schemata for processes that link memories of the various steps involved in long division, regression analysis, or simply making inferences from evidence and writing an intelligence report.

Any given point in memory may be connected to many different overlapping schemata. This system is highly complex and not well understood.

This conception of a schema is so general that it begs many important questions of interest to memory researchers, but it is the best that can be done given the current state of knowledge. It serves the purpose of emphasizing that memory does have structure. It also shows that how knowledge is connected in memory is critically important in determining what information is retrieved in response to any stimulus and how that information is used in reasoning.

Concepts and schemata stored in memory exercise a powerful influence on the formation of perceptions from sensory data. Recall the experiment discussed in the previous chapter in which test subjects were exposed very briefly to playing cards that had been doctored so that some hearts were black and spades red. When retained in SIS for a fraction of a second, the spades were indeed red. In the course of interpreting the sensory impression and transferring it to STM, however, the spades became black because the memory system has no readily available schema for a

red spade to be matched against the sensory impression. If information does not fit into what people know, or think they know, they have great difficulty processing it.

The content of schemata in memory is a principal factor distinguishing stronger from weaker analytical ability. This is aptly illustrated by an experiment with chess players. When chess grandmasters and masters and ordinary chess players were given five to 10 seconds to note the position of 20 to 25 chess pieces placed randomly on a chess board, the masters and ordinary players were alike in being able to remember the places of only about six pieces. If the positions of the pieces were taken from an actual game (unknown to the test subjects), however, the grandmasters and masters were usually able to reproduce almost all the positions without error, while the ordinary players were still able to place correctly only a half-dozen pieces.[32]

That the unique ability of the chess masters did not result from a pure feat of memory is indicated by the masters' inability to perform better than ordinary players in remembering randomly placed positions. Their exceptional performance in remembering positions from actual games stems from their ability to immediately perceive patterns that enable them to process many bits of information together as a single chunk or schema. The chess master has available in long-term memory many schemata that connect individual positions together in coherent patterns. When the position of chess pieces on the board corresponds to a recognized schema, it is very easy for the master to remember not only the positions of the pieces, but the outcomes of previous games in which the pieces were in these positions. Similarly, the unique abilities of the master analyst are attributable to the schemata in long-term memory that enable the analyst to perceive patterns in data that pass undetected by the average observer.

Getting Information Into and Out of Long-Term Memory. It used to be that how well a person learned something was thought to depend upon how long it was kept in short-term memory or the number of times they repeated it to themselves. Research evidence now suggests that neither of these factors plays the critical role. Continuous repetition does not necessarily guarantee that something will be remembered. The key

32. A. D. deGroot, *Thought and Choice in Chess* (The Hague: Mouton, 1965) cited by Herbert A. Simon, "How Big Is a Chunk?" *Science*, Vol. 183 (1974), p. 487.

factor in transferring information from short-term to long-term memory is the development of associations between the new information and schemata already available in memory. This, in turn, depends upon two variables: the extent to which the information to be learned relates to an already existing schema, and the level of processing given to the new information.

Take one minute to try to memorize the following items from a shopping list: bread, eggs, butter, salami, corn, lettuce, soap, jelly, chicken, and coffee. Chances are, you will try to burn the words into your mind by repeating them over and over. Such repetition, or maintenance rehearsal, is effective for maintaining the information in STM, but is an inefficient and often ineffective means of transferring it to LTM. The list is difficult to memorize because it does not correspond with any schema already in memory.

The words are familiar, but you do not have available in memory a schema that connects the words in this particular group to each other. If the list were changed to juice, cereal, milk, sugar, bacon, eggs, toast, butter, jelly, and coffee, the task would be much easier because the data would then correspond with an existing schema—items commonly eaten for breakfast. Such a list can be assimilated to your existing store of knowledge with little difficulty, just as the chess master rapidly assimilates the positions of many chessmen.

Depth of processing is the second important variable in determining how well information is retained. Depth of processing refers to the amount of effort and cognitive capacity employed to process information, and the number and strength of associations that are thereby forged between the data to be learned and knowledge already in memory. In experiments to test how well people remember a list of words, test subjects might be asked to perform different tasks that reflect different levels of processing. The following illustrative tasks are listed in order of the depth of mental processing required: say how many letters there are in each word on the list, give a word that rhymes with each word, make a mental image of each word, make up a story that incorporates each word.

It turns out that the greater the depth of processing, the greater the ability to recall words on a list. This result holds true regardless of whether the test subjects are informed in advance that the purpose of the experiment is to test them on their memory. Advising test subjects to expect a test makes almost no difference in their performance, presum-

ably because it only leads them to rehearse the information in short-term memory, which is ineffective as compared with other forms of processing.

There are three ways in which information may be learned or committed to memory: by rote, assimilation, or use of a mnemonic device. Each of these procedures is discussed below.[33]

By Rote. Material to be learned is repeated verbally with sufficient frequency that it can later be repeated from memory without use of any memory aids. When information is learned by rote, it forms a separate schema not closely interwoven with previously held knowledge. That is, the mental processing adds little by way of elaboration to the new information, and the new information adds little to the elaboration of existing schemata. Learning by rote is a brute force technique. It seems to be the least efficient way of remembering.

By Assimilation. Information is learned by assimilation when the structure or substance of the information fits into some memory schema already possessed by the learner. The new information is assimilated to or linked to the existing schema and can be retrieved readily by first accessing the existing schema and then reconstructing the new information. Assimilation involves learning by comprehension and is, therefore, a desirable method, but it can only be used to learn information that is somehow related to our previous experience.

By Using A Mnemonic Device. A mnemonic device is any means of organizing or encoding information for the purpose of making it easier to remember. A high school student cramming for a geography test might use the acronym "HOMES" as a device for remembering the first letter of each of the Great Lakes—Huron, Ontario, etc.

To learn the first grocery list of disconnected words, you would create some structure for linking the words to each other and/or to information already in LTM. You might imagine yourself shopping or putting the items away and mentally picture where they are located on the shelves at the market or in the kitchen. Or you might imagine a story concerning one or more meals that include all these items. Any form of processing information in this manner is a more effective aid to retention than rote repetition. Even more effective systems for quickly memorizing lists of

33. This discussion draws on Francis S. Bellezza, "Mnemonic Devices: Classification, Characteristics, and Criteria" (Athens, Ohio: Ohio University, pre-publication manuscript, January 1980).

names or words have been devised by various memory experts, but these require some study and practice in their use.

Mnemonic devices are useful for remembering information that does not fit any appropriate conceptual structure or schema already in memory. They work by providing a simple, artificial structure to which the information to be learned is then linked. The mnemonic device supplies the mental "file categories" that ensure retrievability of information. To remember, first recall the mnemonic device, then access the desired information.

Memory and Intelligence Analysis

An analyst's memory provides continuous input into the analytical process. This input is of two types—additional factual information on historical background and context, and schemata the analyst uses to determine the meaning of newly acquired information. Information from memory may force itself on the analyst's awareness without any deliberate effort by the analyst to remember; or, recall of the information may require considerable time and strain. In either case, anything that influences what information is remembered or retrieved from memory also influences intelligence analysis.

Judgment is the joint product of the available information and what the analyst brings to the analysis of this information. An experiment documenting differences between chess masters and ordinary chess players was noted earlier. Similar research with medical doctors diagnosing illness indicates that differences between stronger and weaker performers are to be found in the organization of information and experience in long-term memory.[34] The same presumably holds true for intelligence analysts. Substantive knowledge and analytical experience determine the store of memories and schemata the analyst draws upon to generate and evaluate hypotheses. The key is not a simple ability to recall facts, but the ability to recall patterns that relate facts to each other and to broader concepts—and to employ procedures that facilitate this process.

34. Arthur S. Elstein, Lee S. Shulman & Sarah A. Sprafka, *Medical Problem Solving: An Analysis of Clinical Reasoning* (Cambridge, MA: Harvard University Press, 1978), p. 276.

Stretching the Limits of Working Memory

Limited information is available on what is commonly thought of as "working memory"—the collection of information that an analyst holds in the forefront of the mind as he or she does analysis. The general concept of working memory seems clear from personal introspection. In writing this chapter, I am very conscious of the constraints on my ability to keep many pieces of information in mind while experimenting with ways to organize this information and seeking words to express my thoughts. To help offset these limits on my working memory, I have accumulated a large number of written notes containing ideas and half-written paragraphs. Only by using such external memory aids am I able to cope with the volume and complexity of the information I want to use.

A well-known article written over 40 years ago, titled "The Magic Number Seven—Plus or Minus Two," contends that seven—plus or minus two—is the number of things people can keep in their head all at once.[35] That limitation on working memory is the source of many problems. People have difficulty grasping a problem in all its complexity. This is why we sometimes have trouble making up our minds. For example, we think first about the arguments in favor, and then about the arguments against, and we can't keep all those pros and cons in our head at the same time to get an overview of how they balance off against each other.

The recommended technique for coping with this limitation of working memory is called externalizing the problem—getting it out of one's head and down on paper in some simplified form that shows the main elements of the problem and how they relate to each other. Chapter 7, "Structuring Analytical Problems," discusses ways of doing this. They all involve breaking down a problem into its component parts and then preparing a simple "model" that shows how the parts relate to the whole. When working on a small part of the problem, the model keeps one from losing sight of the whole.

A simple model of an analytical problem facilitates the assimilation of new information into long-term memory; it provides a structure to which bits and pieces of information can be related. The model defines the categories for filing information in memory and retrieving it on

35. George A. Miller, "The Magical Number Seven--Plus or Minus Two: Some Limits on our Capacity for Processing Information." *The Psychological Review*, Vol. 63, No. 2 (March 1956).

demand. In other words, it serves as a mnemonic device that provides the hooks on which to hang information so that it can be found when needed.

The model is initially an artificial construct, like the previously noted acronym "HOMES." With usage, however, it rapidly becomes an integral part of one's conceptual structure—the set of schemata used in processing information. At this point, remembering new information occurs by assimilation rather than by mnemonics. This enhances the ability to recall and make inferences from a larger volume of information in a greater variety of ways than would otherwise be possible.

"Hardening of the Categories". Memory processes tend to work with generalized categories. If people do not have an appropriate category for something, they are unlikely to perceive it, store it in memory, or be able to retrieve it from memory later. If categories are drawn incorrectly, people are likely to perceive and remember things inaccurately. When information about phenomena that are different in important respects nonetheless gets stored in memory under a single concept, errors of analysis may result. For example, many observers of international affairs had the impression that Communism was a monolithic movement, that it was the same everywhere and controlled from Moscow. All Communist countries were grouped together in a single, undifferentiated category called "international Communism" or "the Communist bloc." In 1948, this led many in the United States to downplay the importance of the Stalin-Tito split. According to one authority, it "may help explain why many Western minds, including scholars, remained relatively blind to the existence and significance of Sino-Soviet differences long after they had been made manifest in the realm of ideological formulae."[36]

"Hardening of the categories" is a common analytical weakness. Fine distinctions among categories and tolerance for ambiguity contribute to more effective analysis.

Things That Influence What Is Remembered. Factors that influence how information is stored in memory and that affect future retrievability include: being the first-stored information on a given topic, the amount of attention focused on the information, the credibility of the information, and the importance attributed to the information at the

36. Robert Tucker, "Communist Revolutions, National Cultures, and the Divided Nations," *Studies in Comparative Communism* (Autumn 1974), 235-245.

moment of storage. By influencing the content of memory, all of these factors also influence the outcome of intelligence analysis.

Chapter 12 on "Biases in Estimating Probabilities" describes how availability in memory influences judgments of probability. The more instances a person can recall of a phenomenon, the more probable that phenomenon seems to be. This is true even though ability to recall past examples is influenced by vividness of the information, how recently something occurred, its impact upon one's personal welfare, and many other factors unrelated to the actual probability of the phenomenon.

Memory Rarely Changes Retroactively. Analysts often receive new information that should, logically, cause them to reevaluate the credibility or significance of previous information. Ideally, the earlier information should then become either more salient and readily available in memory, or less so. But it does not work that way. Unfortunately, memories are seldom reassessed or reorganized retroactively in response to new information. For example, information that is dismissed as unimportant or irrelevant because it did not fit an analyst's expectations does not become more memorable even if the analyst changes his or her thinking to the point where the same information, received today, would be recognized as very significant.

Memory Can Handicap as Well as Help

Understanding how memory works provides some insight into the nature of creativity, openness to new information, and breaking mind-sets. All involve spinning new links in the spider web of memory—links among facts, concepts, and schemata that previously were not connected or only weakly connected.

Training courses for intelligence analysts sometimes focus on trying to open up an analyst's established mind-set, to get him or her to see problems from different perspectives in order to give a fairer shake to alternative explanations. More often than not, the reaction of experienced analysts is that they have devoted 20 years to developing their present mind-set, that it has served them well, and that they see no need to change it. Such analysts view themselves, often accurately, as comparable to the chess masters. They believe the information embedded in their long-term memory permits them to perceive patterns and make inferences that are beyond the reach of other observers. In one sense, they are quite correct in not wanting to change; it is, indeed, their existing

schemata or mind-set that enables them to achieve whatever success they enjoy in making analytical judgments.

There is, however, a crucial difference between the chess master and the master intelligence analyst. Although the chess master faces a different opponent in each match, the environment in which each contest takes place remains stable and unchanging: the permissible moves of the diverse pieces are rigidly determined, and the rules cannot be changed without the master's knowledge. Once the chess master develops an accurate schema, there is no need to change it. The intelligence analyst, however, must cope with a rapidly changing world. Many countries that previously were US adversaries are now our formal or de facto allies. The American and Russian governments and societies are not the same today as they were 20 or even 10 or five years ago. Schemata that were valid yesterday may no longer be functional tomorrow.

Learning new schemata often requires the unlearning of existing ones, and this is exceedingly difficult. It is always easier to learn a new habit than to unlearn an old one. Schemata in long-term memory that are so essential to effective analysis are also the principal source of inertia in recognizing and adapting to a changing environment. Chapter 6, "Keeping an Open Mind," identifies tools for dealing with this problem.

PART II—TOOLS FOR THINKING

Chapter 4

Strategies for Analytical Judgment: Transcending the Limits of Incomplete Information

When intelligence analysts make thoughtful analytical judgments, how do they do it? In seeking answers to this question, this chapter discusses the strengths and limitations of situational logic, theory, comparison, and simple immersion in the data as strategies for the generation and evaluation of hypotheses. The final section discusses alternative strategies for choosing among hypotheses. One strategy too often used by intelligence analysts is described as "satisficing"—choosing the first hypothesis that appears good enough rather than carefully identifying all possible hypotheses and determining which is most consistent with the evidence.[37]

* * * * * * * * * * * * * * * * * * * *

Intelligence analysts should be self-conscious about their reasoning process. They should think about *how* they make judgments and reach conclusions, not just about the judgments and conclusions themselves. Webster's dictionary defines judgment as arriving at a "decision or conclusion on the basis of indications and probabilities when the facts are not clearly ascertained." [38] Judgment is what analysts use to fill gaps in their knowledge. It entails going beyond the available information and is the principal means of coping with uncertainty. It always involves an analytical leap, from the known into the uncertain.

37. An earlier version of this chapter was published as an unclassified article in *Studies in Intelligence* in 1981, under the title "Strategies for Analytical Judgment."
38. Webster's *New International Dictionary*, unabridged, 1954.

Judgment is an integral part of all intelligence analysis. While the optimal goal of intelligence collection is complete knowledge, this goal is seldom reached in practice. Almost by definition of the intelligence mission, intelligence issues involve considerable uncertainty. Thus, the analyst is commonly working with incomplete, ambiguous, and often contradictory data. The intelligence analyst's function might be described as transcending the limits of incomplete information through the exercise of analytical judgment.

The ultimate nature of judgment remains a mystery. It is possible, however, to identify diverse strategies that analysts employ to process information as they prepare to pass judgment. Analytical strategies are important because they influence the data one attends to. They determine where the analyst shines his or her searchlight, and this inevitably affects the outcome of the analytical process.

Strategies for Generating and Evaluating Hypotheses

This book uses the term hypothesis in its broadest sense as a potential explanation or conclusion that is to be tested by collecting and presenting evidence. Examination of how analysts generate and evaluate hypotheses identifies three principal strategies—the application of theory, situational logic, and comparison—each of which is discussed at some length below. A "non-strategy," immersion in the data and letting the data speak for themselves, is also discussed. This list of analytical strategies is not exhaustive. Other strategies might include, for example, projecting one's own psychological needs onto the data at hand, but this discussion is not concerned with the pathology of erroneous judgment. Rather, the goal is to understand the several kinds of careful, conscientious analysis one would hope and expect to find among a cadre of intelligence analysts dealing with highly complex issues.

Situational Logic

This is the most common operating mode for intelligence analysts. Generation and analysis of hypotheses start with consideration of concrete elements of the current situation, rather than with broad generalizations that encompass many similar cases. The situation is regarded as one-of-a-kind, so that it must be understood in terms of its own unique logic, rather than as one example of a broad class of comparable events.

Starting with the known facts of the current situation and an understanding of the unique forces at work at that particular time and place, the analyst seeks to identify the logical antecedents or consequences of this situation. A scenario is developed that hangs together as a plausible narrative. The analyst may work backwards to explain the origins or causes of the current situation or forward to estimate the future outcome.

Situational logic commonly focuses on tracing cause-effect relationships or, when dealing with purposive behavior, means-ends relationships. The analyst identifies the goals being pursued and explains why the foreign actor(s) believe certain means will achieve those goals.

Particular strengths of situational logic are its wide applicability and ability to integrate a large volume of relevant detail. Any situation, however unique, may be analyzed in this manner.

Situational logic as an analytical strategy also has two principal weaknesses. One is that it is so difficult to understand the mental and bureaucratic processes of foreign leaders and governments. To see the options faced by foreign leaders as these leaders see them, one must understand their values and assumptions and even their misperceptions and misunderstandings. Without such insight, interpreting foreign leaders' decisions or forecasting future decisions is often little more than partially informed speculation. Too frequently, foreign behavior appears "irrational" or "not in their own best interest." Such conclusions often indicate analysts have projected American values and conceptual frameworks onto the foreign leaders and societies, rather than understanding the logic of the situation as it appears to them.

The second weakness is that situational logic fails to exploit the theoretical knowledge derived from study of similar phenomena in other countries and other time periods. The subject of national separatist movements illustrates the point. Nationalism is a centuries-old problem, but most Western industrial democracies have been considered well-integrated national communities. Even so, recent years have seen an increase in pressures from minority ethnic groups seeking independence or autonomy. Why has this phenomenon occurred recently in Scotland, southern France and Corsica, Quebec, parts of Belgium, and Spain—as well as in less stable Third World countries where it might be expected?

Dealing with this topic in a logic-of-the-situation mode, a country analyst would examine the diverse political, economic, and social groups whose interests are at stake in the country. Based on the relative power

positions of these groups, the dynamic interactions among them, and anticipated trends or developments that might affect the future positions of the interested parties, the analyst would seek to identify the driving forces that will determine the eventual outcome.

It is quite possible to write in this manner a detailed and seemingly well-informed study of a separatist movement in a single country while ignoring the fact that ethnic conflict as a generic phenomenon has been the subject of considerable theoretical study. By studying similar phenomena in many countries, one can generate and evaluate hypotheses concerning root causes that may not even be considered by an analyst who is dealing only with the logic of a single situation. For example, to what extent does the resurgence of long-dormant ethnic sentiments stem from a reaction against the cultural homogenization that accompanies modern mass communications systems?

Analyzing many examples of a similar phenomenon, as discussed below, enables one to probe more fundamental causes than those normally considered in logic-of-the-situation analysis. The proximate causes identified by situational logic appear, from the broader perspective of theoretical analysis, to be but symptoms indicating the presence of more fundamental causal factors. A better understanding of these fundamental causes is critical to effective forecasting, especially over the longer range. While situational logic may be the best approach to estimating short-term developments, a more theoretical approach is required as the analytical perspective moves further into the future.

Applying Theory

Theory is an academic term not much in vogue in the Intelligence Community, but it is unavoidable in any discussion of analytical judgment. In one popular meaning of the term, "theoretical" is associated with the terms "impractical" and "unrealistic". Needless to say, it is used here in a quite different sense.

A theory is a generalization based on the study of many examples of some phenomenon. It specifies that when a given set of conditions arises, certain other conditions will follow either with certainty or with some degree of probability. In other words, conclusions are judged to follow from a set of conditions and a finding that these conditions apply in the specific case being analyzed. For example, Turkey is a developing country in a precarious strategic position. This defines a set of conditions that

imply conclusions concerning the role of the military and the nature of political processes in that country, because analysts have an implicit if not explicit understanding of how these factors normally relate.

What academics refer to as theory is really only a more explicit version of what intelligence analysts think of as their basic understanding of how individuals, institutions, and political systems normally behave.

There are both advantages and drawbacks to applying theory in intelligence analysis. One advantage is that "theory economizes thought." By identifying the key elements of a problem, theory enables an analyst to sort through a mass of less significant detail. Theory enables the analyst to see beyond today's transient developments, to recognize which trends are superficial and which are significant, and to foresee future developments for which there is today little concrete evidence.

Consider, for example, the theoretical proposition that economic development and massive infusion of foreign ideas in a feudal society lead to political instability. This proposition seems well established. When applied to Saudi Arabia, it suggests that the days of the Saudi monarchy are numbered, although analysts of the Saudi scene using situational logic find little or no current evidence of a meaningful threat to the power and position of the royal family. Thus, the application of a generally accepted theoretical proposition enables the analyst to forecast an outcome for which the "hard evidence" has not yet begun to develop. This is an important strength of theoretical analysis when applied to real-world problems.

Yet this same example also illustrates a common weakness in applying theory to analysis of political phenomena. Theoretical propositions frequently fail to specify the time frame within which developments might be anticipated to occur. The analytical problem with respect to Saudi Arabia is not so much whether the monarchy will *eventually* be replaced, as when or under what conditions this might happen. Further elaboration of the theory relating economic development and foreign ideas to political instability in feudal societies would identify early warning indicators that analysts might look for. Such indicators would guide both intelligence collection and analysis of sociopolitical and socioeconomic data and lead to hypotheses concerning when or under what circumstances such an event might occur.

But if theory enables the analyst to transcend the limits of available data, it may also provide the basis for ignoring evidence that is truly

indicative of future events. Consider the following theoretical propositions in the light of popular agitation against the Shah of Iran in the late 1970s: (1) When the position of an authoritarian ruler is threatened, he will defend his position with force if necessary. (2) An authoritarian ruler enjoying complete support of effective military and security forces cannot be overthrown by popular opinion and agitation. Few would challenge these propositions, yet when applied to Iran in the late 1970s, they led Iran specialists to misjudge the Shah's chances for retaining the peacock throne. Many if not most such specialists seemed convinced that the Shah remained strong and that he would crack down on dissent when it threatened to get out of control. Many persisted in this assessment for several months after the accumulation of what in retrospect appears to have been strong evidence to the contrary.

Persistence of these assumptions is easily understood in psychological terms. When evidence is lacking or ambiguous, the analyst evaluates hypotheses by applying his or her general background knowledge concerning the nature of political systems and behavior. The evidence on the strength of the Shah and his intention to crack down on dissidents was ambiguous, but the Iranian monarch was an authoritarian ruler, and authoritarian regimes were assumed to have certain characteristics, as noted in the previously cited propositions. Thus beliefs about the Shah were embedded in broad and persuasive assumptions about the nature of authoritarian regimes *per se.* For an analyst who believed in the two aforementioned propositions, it would have taken far more evidence, including more unambiguous evidence, to infer that the Shah would be overthrown than to justify continued confidence in his future.[39]

Figure 4 below illustrates graphically the difference between theory and situational logic. Situational logic looks at the evidence within a single country on multiple interrelated issues, as shown by the column

39. Even in retrospect these two propositions still seem valid, which is why some aspects of the Shah's fall remain incredible. There are, in principle, three possible reasons why these seemingly valid theoretical assumptions failed to generate an accurate estimate on Iran: (1) One or more of the initial conditions posited by the theory did not in fact apply--for example, the Shah was not really an authoritarian ruler. (2) The theory is only partially valid, in that there are certain circumstances under which it does and does not apply. These limiting conditions need to be specified. (3) The theory is basically valid, but one cannot expect 100-percent accuracy from social science theories. Social science, as distinct from natural science, deals with a probabilistic environment. One cannot foresee all the circumstances that might cause an exception to the general rules, so the best that can be expected is that the given conditions will lead to the specified outcome most of the time.

Figure 4

Situational Logic Vs. Theory

highlighted in gray. This is a typical area studies approach. Theoretical analysis looks at the evidence related to a single issue in multiple countries, as shown by the row highlighted in gray. This is a typical social science approach.

The distinction between theory and situational logic is not as clear as it may seem from this graphic, however. Logic-of-the-situation analysis also draws heavily on theoretical assumptions. How does the analyst select the most significant elements to describe the current situation, or identify the causes or consequences of these elements, without some implicit theory that relates the likelihood of certain outcomes to certain antecedent conditions?

For example, if the analyst estimating the outcome of an impending election does not have current polling data, it is necessary to look back at past elections, study the campaigns, and then judge how voters are likely to react to the current campaigns and to events that influence voter attitudes. In doing so, the analyst operates from a set of assumptions about human nature and what drives people and groups. These assumptions form part of a theory of political behavior, but it is a different sort of theory than was discussed under theoretical analysis. It does not illuminate the entire situation, but only a small increment of the situation, and it may not apply beyond the specific country of concern. Further, it is

much more likely to remain implicit, rather than be a focal point of the analysis.

Comparison with Historical Situations

A third approach for going beyond the available information is comparison. An analyst seeks understanding of current events by comparing them with historical precedents in the same country, or with similar events in other countries. Analogy is one form of comparison. When an historical situation is deemed comparable to current circumstances, analysts use their understanding of the historical precedent to fill gaps in their understanding of the current situation. Unknown elements of the present are assumed to be the same as known elements of the historical precedent. Thus, analysts reason that the same forces are at work, that the outcome of the present situation is likely to be similar to the outcome of the historical situation, or that a certain policy is required in order to avoid the same outcome as in the past.

Comparison differs from situational logic in that the present situation is interpreted in the light of a more or less explicit conceptual model that is created by looking at similar situations in other times or places. It differs from theoretical analysis in that this conceptual model is based on a single case or only a few cases, rather than on many similar cases. Comparison may also be used to generate theory, but this is a more narrow kind of theorizing that cannot be validated nearly as well as generalizations inferred from many comparable cases.

Reasoning by comparison is a convenient shortcut, one chosen when neither data nor theory are available for the other analytical strategies, or simply because it is easier and less time-consuming than a more detailed analysis. A careful comparative analysis starts by specifying key elements of the present situation. The analyst then seeks out one or more historical precedents that may shed light on the present. Frequently, however, a historical precedent may be so vivid and powerful that it imposes itself upon a person's thinking from the outset, conditioning them to perceive the present primarily in terms of its similarity to the past. This is reasoning by analogy. As Robert Jervis noted, "historical analogies often precede, rather than follow, a careful analysis of a situation."[40]

40. Robert Jervis, "Hypotheses on Misperception," *World Politics* 20 (April 1968), p. 471.

The tendency to relate contemporary events to earlier events as a guide to understanding is a powerful one. Comparison helps achieve understanding by reducing the unfamiliar to the familiar. In the absence of data required for a full understanding of the current situation, reasoning by comparison may be the only alternative. Anyone taking this approach, however, should be aware of the significant potential for error. This course is an implicit admission of the lack of sufficient information to understand the present situation in its own right, and lack of relevant theory to relate the present situation to many other comparable situations

The difficulty, of course, is in being certain that two situations are truly comparable. Because they are equivalent in some respects, there is a tendency to reason as though they were equivalent in all respects, and to assume that the current situation will have the same or similar outcome as the historical situation. This is a valid assumption only when based on in-depth analysis of both the current situation *and* the historical precedent to ensure that they are actually comparable in all relevant respects.

In a short book that ought to be familiar to all intelligence analysts, Ernest May traced the impact of historical analogy on US foreign policy.[41] He found that because of reasoning by analogy, US policymakers tend to be one generation behind, determined to avoid the mistakes of the previous generation. They pursue the policies that would have been most appropriate in the historical situation but are not necessarily well adapted to the current one.

Policymakers in the 1930s, for instance, viewed the international situation as analogous to that before World War I. Consequently, they followed a policy of isolation that would have been appropriate for preventing American involvement in the first World War but failed to prevent the second. Communist aggression after World War II was seen as analogous to Nazi aggression, leading to a policy of containment that could have prevented World War II.

More recently, the Vietnam analogy has been used repeatedly over many years to argue against an activist US foreign policy. For example, some used the Vietnam analogy to argue against US participation in the Gulf War—a flawed analogy because the operating terrain over which

41. Ernest May, *`Lessons' of the Past: The Use and Misuse of History in American Foreign Policy* (New York: Oxford University Press, 1973).

battles were fought was completely different in Kuwait/Iraq and much more in our favor there as compared with Vietnam.

May argues that policymakers often perceive problems in terms of analogies with the past, but that they ordinarily use history badly:

> When resorting to an analogy, they tend to seize upon the first that comes to mind. They do not research more widely. Nor do they pause to analyze the case, test its fitness, or even ask in what ways it might be misleading.[42]

As compared with policymakers, intelligence analysts have more time available to "analyze rather than analogize." Intelligence analysts tend to be good historians, with a large number of historical precedents available for recall. The greater the number of potential analogues an analyst has at his or her disposal, the greater the likelihood of selecting an appropriate one. The greater the depth of an analyst's knowledge, the greater the chances the analyst will perceive the differences as well as the similarities between two situations. Even under the best of circumstances, however, inferences based on comparison with a single analogous situation probably are more prone to error than most other forms of inference.

The most productive uses of comparative analysis are to suggest hypotheses and to highlight differences, not to draw conclusions. Comparison can suggest the presence or the influence of variables that are not readily apparent in the current situation, or stimulate the imagination to conceive explanations or possible outcomes that might not otherwise occur to the analyst. In short, comparison can generate hypotheses that then guide the search for additional information to confirm or refute these hypotheses. It should not, however, form the basis for conclusions unless thorough analysis of both situations has confirmed they are indeed comparable.

Data Immersion

Analysts sometimes describe their work procedure as immersing themselves in the data without fitting the data into any preconceived pattern. At some point an apparent pattern (or answer or explanation) emerges spontaneously, and the analyst then goes back to the data to check how well the data support this judgment. According to this view,

42. Ibid., p. xi.

objectivity requires the analyst to suppress any personal opinions or preconceptions, so as to be guided only by the "facts" of the case.

To think of analysis in this way overlooks the fact that information cannot speak for itself. The significance of information is always a joint function of the nature of the information and the context in which it is interpreted. The context is provided by the analyst in the form of a set of assumptions and expectations concerning human and organizational behavior. These preconceptions are critical determinants of which information is considered relevant and how it is interpreted.

Of course there are many circumstances in which the analyst has no option but to immerse himself or herself in the data. Obviously, an analyst must have a base of knowledge to work with before starting analysis. When dealing with a new and unfamiliar subject, the uncritical and relatively non-selective accumulation and review of information is an appropriate first step. But this is a process of absorbing information, not analyzing it.

Analysis begins when the analyst consciously inserts himself or herself into the process to select, sort, and organize information. This selection and organization can only be accomplished according to conscious or subconscious assumptions and preconceptions.

The question is not whether one's prior assumptions and expectations influence analysis, but only whether this influence is made explicit or remains implicit. The distinction appears to be important. In research to determine how physicians make medical diagnoses, the doctors who comprised the test subjects were asked to describe their analytical strategies. Those who stressed thorough collection of data as their principal analytical method were significantly less accurate in their diagnoses than those who described themselves as following other analytical strategies such as identifying and testing hypotheses.[43] Moreover, the collection of additional data through greater thoroughness in the medical history and physical examination did not lead to increased diagnostic accuracy.[44]

One might speculate that the analyst who seeks greater objectivity by suppressing recognition of his or her own subjective input actually has less valid input to make. Objectivity is gained by making assumptions

43. Arthur S. Elstein, Lee S. Shulman, and Sarah A. Sprafka, *Medical Problem Solving: An Analysis of Clinical Reasoning* (Cambridge, MA: Harvard University Press, 1978), p. 270.
44. Ibid., p. 281. For more extensive discussion of the value of additional information, see Chapter 5, "Do You Really Need More Information?"

explicit so that they may be examined and challenged, not by vain efforts to eliminate them from analysis.

Relationships Among Strategies

No one strategy is necessarily better than the others. In order to generate all relevant hypotheses and make maximum use of all potentially relevant information, it would be desirable to employ all three strategies at the early hypothesis generation phase of a research project. Unfortunately, analysts commonly lack the inclination or time to do so.

Different analysts have different analytical habits and preferences for analytical strategy. As a broad generalization that admits numerous exceptions, analysts trained in area studies or history tend to prefer situational logic, while those with a strong social science background are more likely to bring theoretical and comparative insights to bear on their work. The Intelligence Community as a whole is far stronger in situational logic than in theory. In my judgment, intelligence analysts do not generalize enough, as opposed to many academic scholars who generalize too much. This is especially true in political analysis, and it is not entirely due to unavailability of applicable political theory. Theoretical insights that are available are often unknown to or at least not used by political intelligence analysts.

Differences in analytical strategy may cause fundamental differences in perspective between intelligence analysts and some of the policymakers for whom they write. Higher level officials who are not experts on the subject at issue use far more theory and comparison and less situational logic than intelligence analysts. Any policymaker or other senior manager who lacks the knowledge base of the specialist and does not have time for detail must, of necessity, deal with broad generalizations. Many decisions must be made, with much less time to consider each of them than is available to the intelligence analyst. This requires the policymaker to take a more conceptual approach, to think in terms of theories, models, or analogies that summarize large amounts of detail. Whether this represents sophistication or oversimplification depends upon the individual case and, perhaps, whether one agrees or disagrees with the judgments made. In any event, intelligence analysts would do well to take this phenomenon into account when writing for their consumers.

Strategies for Choice Among Hypotheses

A systematic analytical process requires selection among alternative hypotheses, and it is here that analytical practice often diverges significantly from the ideal and from the canons of scientific method. The ideal is to generate a full set of hypotheses, systematically evaluate each hypothesis, and then identify the hypothesis that provides the best fit to the data. Scientific method, for its part, requires that one seek to disprove hypotheses rather than confirm them.

In practice, other strategies are commonly employed. Alexander George has identified a number of less-than-optimal strategies for making decisions in the face of incomplete information and multiple, competing values and goals. While George conceived of these strategies as applicable to how decisionmakers choose among alternative policies, most also apply to how intelligence analysts might decide among alternative analytical hypotheses.

The relevant strategies George identified are:

- "Satisficing"—selecting the first identified alternative that appears "good enough" rather than examining all alternatives to determine which is "best."

- Incrementalism—focusing on a narrow range of alternatives representing marginal change, without considering the need for dramatic change from an existing position.

- Consensus—opting for the alternative that will elicit the greatest agreement and support. Simply telling the boss what he or she wants to hear is one version of this.

- Reasoning by analogy—choosing the alternative that appears most likely to avoid some previous error or to duplicate a previous success.

- Relying on a set of principles or maxims that distinguish a "good" from a "bad" alternative.[45]

45. Alexander George, *Presidential Decisionmaking in Foreign Policy: The Effective Use of Information and Advice* (Boulder, CO: Westview Press, 1980), Chapter 2.

The intelligence analyst has another tempting option not available to the policymaker: to avoid judgment by simply describing the current situation, identifying alternatives, and letting the intelligence consumer make the judgment about which alternative is most likely. Most of these strategies are not discussed here. The following paragraphs focus only on the one that seems most prevalent in intelligence analysis.

"Satisficing"

I would suggest, based on personal experience and discussions with analysts, that most analysis is conducted in a manner very similar to the satisficing mode (selecting the first identified alternative that appears "good enough").[46] The analyst identifies what appears to be the most likely hypothesis—that is, the tentative estimate, explanation, or description of the situation that appears most accurate. Data are collected and organized according to whether they support this tentative judgment, and the hypothesis is accepted if it seems to provide a reasonable fit to the data. The careful analyst will then make a quick review of other possible hypotheses and of evidence not accounted for by the preferred judgment to ensure that he or she has not overlooked some important consideration.

This approach has three weaknesses: the selective perception that results from focus on a single hypothesis, failure to generate a complete set of competing hypotheses, and a focus on evidence that confirms rather than disconfirms hypotheses. Each of these is discussed below.

Selective Perception. Tentative hypotheses serve a useful function in helping analysts select, organize, and manage information. They narrow the scope of the problem so that the analyst can focus efficiently on data that are most relevant and important. The hypotheses serve as organizing frameworks in working memory and thus facilitate retrieval of information from memory. In short, they are essential elements of the analytical process. But their functional utility also entails some cost, because a hypothesis functions as a perceptual filter. Analysts, like people in general, tend to see what they are looking for and to overlook that which is not specifically included in their search strategy. They tend to limit the processed information to that which is relevant to the current hypothesis.

46. The concept of "satisficing," of seeking a satisfactory rather than an optimal solution, was developed by Herbert A. Simon and is widely used in the literature on decision analysis.

If the hypothesis is incorrect, information may be lost that would suggest a new or modified hypothesis.

This difficulty can be overcome by the simultaneous consideration of multiple hypotheses. This approach is discussed in detail in Chapter 8. It has the advantage of focusing attention on those few items of evidence that have the greatest diagnostic value in distinguishing among the validity of competing hypotheses. Most evidence is consistent with several different hypotheses, and this fact is easily overlooked when analysts focus on only one hypothesis at a time—especially if their focus is on seeking to confirm rather than disprove what appears to be the most likely answer.

Failure To Generate Appropriate Hypotheses. If tentative hypotheses determine the criteria for searching for information and judging its relevance, it follows that one may overlook the proper answer if it is not encompassed within the several hypotheses being considered. Research on hypothesis generation suggests that performance on this task is woefully inadequate.[47] When faced with an analytical problem, people are either unable or simply do not take the time to identify the full range of potential answers. Analytical performance might be significantly enhanced by more deliberate attention to this stage of the analytical process. Analysts need to take more time to develop a full set of competing hypotheses, using all three of the previously discussed strategies—theory, situational logic, and comparison.

Failure To Consider Diagnosticity of Evidence. In the absence of a complete set of alternative hypotheses, it is not possible to evaluate the "diagnosticity" of evidence. Unfortunately, many analysts are unfamiliar with the concept of diagnosticity of evidence. It refers to the extent to which any item of evidence helps the analyst determine the relative likelihood of alternative hypotheses.

To illustrate, a high temperature may have great value in telling a doctor that a patient is sick, but relatively little value in determining which illness the patient is suffering from. Because a high temperature is consistent with so many possible hypotheses about a patient's illness, it has limited diagnostic value in determining which illness (hypothesis) is the more likely one.

47. Charles Gettys et al., *Hypothesis Generation: A Final Report on Three Years of Research.* Technical Report 15-10-80. University of Oklahoma, Decision Processes Laboratory, 1980.

Evidence is diagnostic when it influences an analyst's judgment on the *relative* likelihood of the various hypotheses. If an item of evidence seems consistent with all the hypotheses, it may have no diagnostic value at all. It is a common experience to discover that most available evidence really is not very helpful, as it can be reconciled with all the hypotheses.

Failure To Reject Hypotheses

Scientific method is based on the principle of rejecting hypotheses, while tentatively accepting only those hypotheses that cannot be refuted. Intuitive analysis, by comparison, generally concentrates on confirming a hypothesis and commonly accords more weight to evidence supporting a hypothesis than to evidence that weakens it. Ideally, the reverse would be true. While analysts usually cannot apply the statistical procedures of scientific methodology to test their hypotheses, they can and should adopt the conceptual strategy of seeking to refute rather than confirm hypotheses.

There are two aspects to this problem: people do not naturally seek disconfirming evidence, and when such evidence is received it tends to be discounted. If there is any question about the former, consider how often people test their political and religious beliefs by reading newspapers and books representing an opposing viewpoint. Concerning the latter, we have noted in Chapter 2, "Perception: Why Can't We See What Is There to Be Seen?" the tendency to accommodate new information to existing images. This is easy to do if information supporting a hypothesis is accepted as valid, while information that weakens it is judged to be of questionable reliability or an unimportant anomaly. When information is processed in this manner, it is easy to "confirm" almost any hypothesis that one already believes to be true.

Apart from the psychological pitfalls involved in seeking confirmatory evidence, an important logical point also needs to be considered. The logical reasoning underlying the scientific method of rejecting hypotheses is that ". . . no confirming instance of a law is a verifying instance, but that any disconfirming instance is a falsifying instance."[48] In other words, a hypothesis can never be proved by the enumeration of even a large body of evidence consistent with that hypothesis, because

48. P. C. Wason, "On the Failure to Eliminate Hypotheses in a Conceptual Task," *The Quarterly Journal of Experimental Psychology*, Vol. XII, Part 3 (1960).

the same body of evidence may also be consistent with other hypotheses. A hypothesis may be disproved, however, by citing a single item of evidence that is incompatible with it.

P. C. Wason conducted a series of experiments to test the view that people generally seek confirming rather than disconfirming evidence.[49] The experimental design was based on the above point that the validity of a hypothesis can only be tested by seeking to disprove it rather than confirm it. Test subjects were given the three-number sequence, 2 - 4 - 6, and asked to discover the rule employed to generate this sequence. In order to do so, they were permitted to generate three-number sequences of their own and to ask the experimenter whether these conform to the rule. They were encouraged to generate and ask about as many sequences as they wished and were instructed to stop only when they believed they had discovered the rule.

There are, of course, many possible rules that might account for the sequence 2 - 4 - 6. The test subjects formulated tentative hypotheses such as any ascending sequence of even numbers, or any sequence separated by two digits. As expected, the test subjects generally took the incorrect approach of trying to confirm rather than eliminate such hypotheses. To test the hypothesis that the rule was any ascending sequence of even numbers, for example, they might ask if the sequence 8 - 10 - 14 conforms to the rule.

Readers who have followed the reasoning to this point will recognize that this hypothesis can never be proved by enumerating examples of ascending sequences of even numbers that are found to conform to the sought-for rule. One can only disprove the hypothesis by citing an ascending sequence of odd numbers and learning that this, too, conforms to the rule.

The correct rule was any three ascending numbers, either odd or even. Because of their strategy of seeking confirming evidence, only six of the 29 test subjects in Wason's experiment were correct the first time they thought they had discovered the rule. When this same experiment was repeated by a different researcher for a somewhat different purpose, none

49. Wason, ibid.

of the 51 test subjects had the right answer the first time they thought they had discovered the rule.[50]

In the Wason experiment, the strategy of seeking confirming rather than disconfirming evidence was particularly misleading because the 2 - 4 - 6 sequence is consistent with such a large number of hypotheses. It was easy for test subjects to obtain confirmatory evidence for almost any hypothesis they tried to confirm. It is important to recognize that comparable situations, when evidence is consistent with several different hypotheses, are extremely common in intelligence analysis.

Consider lists of early warning indicators, for example. They are designed to be indicative of an impending attack. Very many of them, however, are also consistent with the hypothesis that military movements are a bluff to exert diplomatic pressure and that no military action will be forthcoming. When analysts seize upon only one of these hypotheses and seek evidence to confirm it, they will often be led astray.

The evidence available to the intelligence analyst is in one important sense different from the evidence available to test subjects asked to infer the number sequence rule. The intelligence analyst commonly deals with problems in which the evidence has only a probabilistic relationship to the hypotheses being considered. Thus it is seldom possible to eliminate any hypothesis entirely, because the most one can say is that a given hypothesis is unlikely given the nature of the evidence, not that it is impossible.

This weakens the conclusions that can be drawn from a strategy aimed at eliminating hypotheses, but it does not in any way justify a strategy aimed at confirming them.

Circumstances and insufficient data often preclude the application of rigorous scientific procedures in intelligence analysis—including, in particular, statistical methods for testing hypotheses. There is, however, certainly no reason why the basic conceptual strategy of looking for contrary evidence cannot be employed. An optimal analytical strategy requires that analysts search for information to disconfirm their favorite theories, not employ a satisficing strategy that permits acceptance of the first hypothesis that seems consistent with the evidence.

50. Harold M. Weiss and Patrick A. Knight, "The Utility of Humility: Self-Esteem, Information Search, and Problem-Solving Efficiency," *Organizational Behavior and Human Performance*, Vol. 25, No. 2 (April 1980), 216-223.

Conclusion

There are many detailed assessments of intelligence failures, but few comparable descriptions of intelligence successes. In reviewing the literature on intelligence successes, Frank Stech found many examples of success but only three accounts that provide sufficient methodological details to shed light on the intellectual processes and methods that contributed to the successes. These dealt with successful American and British intelligence efforts during World War II to analyze German propaganda, predict German submarine movements, and estimate future capabilities and intentions of the German Air Force.[51]

Stech notes that in each of these highly successful efforts, the analysts employed procedures that ". . . facilitated the formulation and testing against each other of alternative hypothetical estimates of enemy intentions. Each of the three accounts stressed this pitting of competing hypotheses against the evidence."[52]

The simultaneous evaluation of multiple, competing hypotheses permits a more systematic and objective analysis than is possible when an analyst focuses on a single, most-likely explanation or estimate. The simultaneous evaluation of multiple, competing hypotheses entails far greater cognitive strain than examining a single, most-likely hypothesis. Retaining multiple hypotheses in working memory and noting how each item of evidence fits into each hypothesis add up to a formidable cognitive task. That is why this approach is seldom employed in intuitive analysis of complex issues. It can be accomplished, however, with the help of simple procedures described in Chapter 8, "Analysis of Competing Hypotheses."

Chapter 5

Do You Really Need More Information?

The difficulties associated with intelligence analysis are often attributed to the inadequacy of available information. Thus the US Intelligence Community invests heavily in improved intelligence collection systems while managers of analysis lament the comparatively small sums devoted to enhancing analytical resources, improving analytical methods, or gaining better understanding of the cognitive processes involved in making analytical judgments. This chapter questions the often-implicit assumption that lack of information is the principal obstacle to accurate intelligence judgments.[53]

* * * * * * * * * * * * * * * * * * * *

Using experts in a variety of fields as test subjects, experimental psychologists have examined the relationship between the amount of information available to the experts, the accuracy of judgments they make based on this information, and the experts' confidence in the accuracy of these judgments. The word "information," as used in this context, refers to the totality of material an analyst has available to work with in making a judgment.

Using experts in a variety of fields as test subjects, experimental psychologists have examined the relationship between the amount of information available to the experts, the accuracy of judgments they make based on this information, and the experts' confidence in the accuracy of these judgments. The word "information," as used in this context, refers

53. This is an edited version of an article that appeared in *Studies in Intelligence*, Vol. 23, No. 1 (Spring 1979). That *Studies in Intelligence* article was later reprinted in H. Bradford Westerfield, ed., *Inside CIA's Private World: Declassified Articles from the Agency's Internal Journal*, 1955-1992 (New Haven: Yale University Press, 1995). A slightly different version was published in *The Bureaucrat*, Vol. 8, 1979, under the title "Improving Intelligence Analysis: Some Insights on Data, Concepts, and Management in the Intelligence Community." For this book, portions of the original article dealing with improving intelligence analysis have been moved to Chapter 14 on "Improving Intelligence Analysis."

to the totality of material an analyst has available to work with in making a judgment.

Key findings from this research are:

- Once an experienced analyst has the minimum information necessary to make an informed judgment, obtaining additional information generally does not improve the accuracy of his or her estimates. Additional information does, however, lead the analyst to become more confident in the judgment, to the point of overconfidence.

- Experienced analysts have an imperfect understanding of what information they actually use in making judgments. They are unaware of the extent to which their judgments are determined by a few dominant factors, rather than by the systematic integration of all available information. Analysts actually use much less of the available information than they think they do.

As will be noted below, these experimental findings should not necessarily be accepted at face value. For example, circumstances exist in which additional information does contribute to more accurate analysis. However, there also are circumstances in which additional information—particularly contradictory information—decreases rather than increases an analyst's confidence.

To interpret the disturbing but not surprising findings from these experiments, it is necessary to consider four different types of information and discuss their relative value in contributing to the accuracy of analytical judgments. It is also helpful to distinguish analysis in which results are driven by the data from analysis that is driven by the conceptual framework employed to interpret the data.

Understanding the complex relationship between amount of information and accuracy of judgment has implications for both the management and conduct of intelligence analysis. Such an understanding suggests analytical procedures and management initiatives that may indeed contribute to more accurate analytical judgments. It also suggests that resources needed to attain a better understanding of the entire analytical process might profitably be diverted from some of the more costly intelligence collection programs.

These findings have broad relevance beyond the Intelligence Community. Analysis of information to gain a better understanding of current developments and to estimate future outcomes is an essential component of decisionmaking in any field. In fact, the psychological experiments that are most relevant have been conducted with experts in such diverse fields as medical and psychological diagnosis, stock market analysis, weather forecasting, and horserace handicapping. The experiments reflect basic human processes that affect analysis of any subject.

One may conduct experiments to demonstrate these phenomena in any field in which experts analyze a finite number of identifiable and classifiable kinds of information to make judgments or estimates that can subsequently be checked for accuracy. The stock market analyst, for example, commonly works with information concerning price-earnings ratios, profit margins, earnings per share, market volume, and resistance and support levels, and it is relatively easy to measure quantitatively the accuracy of the resulting predictions. By controlling the information made available to a group of experts and then checking the accuracy of judgments based on this information, it is possible to investigate how people use information to arrive at analytical judgments.

An Experiment: Betting on the Horses

A description of one such experiment serves to illustrate the procedure.[54] Eight experienced horserace handicappers were shown a list of 88 variables found on a typical past-performance chart—for example, the weight to be carried; the percentage of races in which horse finished first, second, or third during the previous year; the jockey's record; and the number of days since the horse's last race. Each handicapper was asked to identify, first, what he considered to be the five most important items of information—those he would wish to use to handicap a race if he were limited to only five items of information per horse. Each was then asked to select the 10, 20, and 40 most important variables he would use if limited to those levels of information.

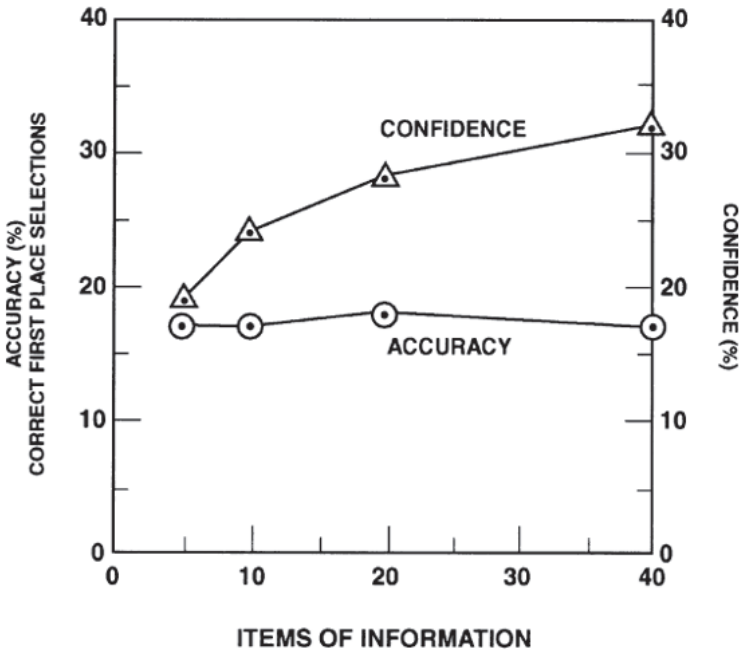
At this point, the handicappers were given true data (sterilized so that horses and actual races could not be identified) for 40 past races and

54. Paul Slovic, "Behavioral Problems of Adhering to a Decision Policy," unpublished manuscript, 1973.

were asked to rank the top five horses in each race in order of expected finish. Each handicapper was given the data in increments of the 5, 10, 20 and 40 variables he had judged to be most useful. Thus, he predicted each race four times—once with each of the four different levels of information. For each prediction, each handicapper assigned a value from 0 to 100 percent to indicate degree of confidence in the accuracy of his prediction.

When the handicappers' predictions were compared with the actual outcomes of these 40 races, it was clear that average accuracy of predictions remained the same regardless of how much information the handicappers had available. Three of the handicappers actually showed less accuracy as the amount of information increased, two improved their accuracy, and three were unchanged. All, however, expressed steadily increasing confidence in their judgments as more information was received. This relationship between amount of information, accuracy of the handi-

Figure 5



cappers' prediction of the first place winners, and the handicappers' confidence in their predictions is shown in Figure 5.

With only five items of information, the handicappers' confidence was well calibrated with their accuracy, but they became overconfident as additional information was received.

The same relationships among amount of information, accuracy, and analyst confidence have been confirmed by similar experiments in other fields.[55] In one experiment with clinical psychologists, a psychological case file was divided into four sections representing successive chronological periods in the life of a relatively normal individual. Thirty-two psychologists with varying levels of experience were asked to make judgments on the basis of this information. After reading each section of the case file, the psychologists answered 25 questions (for which there were known answers) about the personality of the subject of the file. As in other experiments, increasing information resulted in a strong rise in confidence but a negligible increase in accuracy.[56]

A series of experiments to examine the mental processes of medical doctors diagnosing illness found little relationship between thoroughness of data collection and accuracy of diagnosis. Medical students whose self-described research strategy stressed thorough collection of information (as opposed to formation and testing of hypotheses) were significantly below average in the accuracy of their diagnoses. It seems that the explicit formulation of hypotheses directs a more efficient and effective search for information.[57]

Modeling Expert Judgment

Another significant question concerns the extent to which analysts possess an accurate understanding of their own mental processes. How good is their insight into how they actually weight evidence in making judgments? For each situation to be analyzed, they have an implicit "mental model" consisting of beliefs and assumptions as to which vari-

55. For a list of references, see Lewis R. Goldberg, "Simple Models or Simple Processes? Some Research on Clinical Judgments," *American Psychologist*, 23 (1968), pp. 261-265.

57. Arthur S. Elstein *et al., Medical Problem Solving: An Analysis of Clinical Reasoning* (Cambridge, MA and London: Harvard University Press, 1978), pp. 270 and 295.

ables are most important and how they are related to each other. If analysts have good insight into their own mental model, they should be able to identify and describe the variables they have considered most important in making judgments.

There is strong experimental evidence, however, that such self-insight is usually faulty. The expert perceives his or her own judgmental process, including the number of different kinds of information taken into account, as being considerably more complex than is in fact the case. Experts overestimate the importance of factors that have only a minor impact on their judgment and underestimate the extent to which their decisions are based on a few major variables. In short, people's mental models are simpler than they think, and the analyst is typically unaware not only of which variables *should* have the greatest influence, but also which variables *actually* are having the greatest influence.

All this has been demonstrated by experiments in which analysts were asked to make quantitative estimates concerning a relatively large number of cases in their area of expertise, with each case defined by a number of quantifiable factors. In one experiment, for example, stock market analysts were asked to predict long-term price appreciation for 50 securities, with each security being described in such terms as price/earnings ratio, corporate earnings growth trend, and dividend yield.[58] After completing this task, the analysts were asked to explain how they reached their conclusions, including how much weight they attached to each of the variables. They were instructed to be sufficiently explicit that another person going through the same information could apply the same judgmental rules and arrive at the same conclusions.

In order to compare this verbal rationalization with the judgmental policy reflected in the stock market analysts' actual decisions, multiple regression analysis or other similar statistical procedures can be used to develop a mathematical model of how each analyst actually weighed and combined information on the relevant variables.[59] There have been at least eight studies of this type in diverse fields,[60] including one involving

58. Paul Slovic, Dan Fleissner, and W. Scott Bauman, "Analyzing the Use of Information in Investment Decision Making: A Methodological Proposal," *The Journal of Business*, 45 (1972), pp. 283-301.

59. For a discussion of the methodology, see Slovic, Fleissner, and Bauman, op. cit.

prediction of future socioeconomic growth of underdeveloped nations.[61] The mathematical model based on the analyst's actual decisions is invariably a more accurate description of that analyst's decisionmaking than the analyst's own verbal description of how the judgments were made.

Although the existence of this phenomenon has been amply demonstrated, its causes are not well understood. The literature on these experiments contains only the following speculative explanation:

Possibly our feeling that we can take into account a host of different factors comes about because, although we remember that at some time or other we have attended to each of the different factors, we fail to notice that it is seldom more than one or two that we consider at any one time.[62]

When Does New Information Affect Our Judgment?

To evaluate the relevance and significance of these experimental findings in the context of intelligence analysts' experiences, it is necessary to distinguish four types of additional information that an analyst might receive:

- **Additional detail about variables already included in the analysis:** Much raw intelligence reporting falls into this category. One would not expect such supplementary information to affect the overall accuracy of the analyst's judgment, and it is readily understandable that further detail that is consistent with previous information increases the analyst's confidence. Analyses for which considerable depth of detail is available to support the conclusions tend to be more persuasive to their authors as well as to their readers.

- **Identification of additional variables:** Information on additional variables permits the analyst to take into account other factors that may affect the situation. This is the kind of additional information used in the horserace handicapper experi-

61. David A. Summers, J. Dale Taliaferro, and Donna J. Fletcher, "Subjective vs. Objective Description of Judgment Policy," *Psychonomic Science*, 18 (1970) pp. 249-250.
62. R. N. Shepard, "On Subjectively Optimum Selection Among Multiattribute Alternatives," in M. W. Shelly, II and G. L. Bryan, eds., *Human Judgments and Optimality* (New York: Wiley, 1964), p. 166.

ment. Other experiments have employed some combination of additional variables and additional detail on the same variables. The finding that judgments are based on a few critical variables rather than on the entire spectrum of evidence helps to explain why information on additional variables does not normally improve predictive accuracy. Occasionally, in situations when there are known gaps in an analyst's understanding, a single report concerning some new and previously unconsidered factor—for example, an authoritative report on a policy decision or planned coup d'etat—will have a major impact on the analyst's judgment. Such a report would fall into one of the next two categories of new information.

- **Information concerning the value attributed to variables already included in the analysis:** An example of such information would be the horserace handicapper learning that a horse he thought would carry 110 pounds will actually carry only 106. Current intelligence reporting tends to deal with this kind of information; for example, an analyst may learn that a dissident group is stronger than had been anticipated. New facts affect the accuracy of judgments when they deal with changes in variables that are critical to the estimates. Analysts' confidence in judgments based on such information is influenced by their confidence in the accuracy of the information as well as by the amount of information.

- **Information concerning which variables are most important and how they relate to each other:** Knowledge and assumptions as to which variables are most important and how they are interrelated comprise the mental model that tells the analyst how to analyze the data received. Explicit investigation of such relationships is one factor that distinguishes systematic research from current intelligence reporting and raw intelligence. In the context of the horserace handicapper experiment, for example, handicappers had to select which variables to include in their analysis. Is weight carried by a horse more, or less, important than several other variables that affect a horse's performance? Any information that affects this judgment influences how the handi-

capper analyzes the available data; that is, it affects his mental model.

The accuracy of an analyst's judgment depends upon both the accuracy of our mental model (the fourth type of information discussed above) and the accuracy of the values attributed to the key variables in the model (the third type of information discussed above). Additional detail on variables already in the analyst's mental model and information on other variables that do not in fact have a significant influence on our judgment (the first and second types of information) have a negligible impact on accuracy, but form the bulk of the raw material analysts work with. These kinds of information increase confidence because the conclusions seem to be supported by such a large body of data.

This discussion of types of new information is the basis for distinguishing two types of analysis- data-driven analysis and conceptually-driven analysis.

Data-Driven Analysis

In this type of analysis, accuracy depends primarily upon the accuracy and completeness of the available data. If one makes the reasonable assumption that the analytical model is correct and the further assumption that the analyst properly applies this model to the data, then the accuracy of the analytical judgment depends entirely upon the accuracy and completeness of the data.

Analyzing the combat readiness of a military division is an example of data-driven analysis. In analyzing combat readiness, the rules and procedures to be followed are relatively well established. The totality of these procedures comprises a mental model that influences perception of the intelligence collected on the unit and guides judgment concerning what information is important and how this information should be analyzed to arrive at judgments concerning readiness.

Most elements of the mental model can be made explicit so that other analysts may be taught to understand and follow the same analytical procedures and arrive at the same or similar results. There is broad, though not necessarily universal, agreement on what the appropriate model is. There are relatively objective standards for judging the quality

of analysis, inasmuch as the conclusions follow logically from the application of the agreed-upon model to the available data.

Conceptually Driven Analysis

Conceptually driven analysis is at the opposite end of the spectrum from data-driven analysis. The questions to be answered do not have neat boundaries, and there are many unknowns. The number of potentially relevant variables and the diverse and imperfectly understood relationships among these variables involve the analyst in enormous complexity and uncertainty. There is little tested theory to inform the analyst concerning which of the myriad pieces of information are most important and how they should be combined to arrive at probabilistic judgments.

In the absence of any agreed-upon analytical schema, analysts are left to their own devices. They interpret information with the aid of mental models that are largely implicit rather than explicit. Assumptions concerning political forces and processes in the subject country may not be apparent even to the analyst. Such models are not representative of an analytical consensus. Other analysts examining the same data may well reach different conclusions, or reach the same conclusions but for different reasons. This analysis is conceptually driven, because the outcome depends at least as much upon the conceptual framework employed to analyze the data as it does upon the data itself.

To illustrate further the distinction between data-driven and conceptually driven analysis, it is useful to consider the function of the analyst responsible for current intelligence, especially current political intelligence as distinct from longer term research. The daily routine is driven by the incoming wire service news, embassy cables, and clandestine-source reporting from overseas that must be interpreted for dissemination to consumers throughout the Intelligence Community. Although current intelligence reporting is driven by incoming information, this is not what is meant by data-driven analysis. On the contrary, the current intelligence analyst's task is often extremely concept-driven. The analyst must provide immediate interpretation of the latest, often unexpected events. Apart from his or her store of background information, the analyst may have no data other than the initial, usually incomplete report. Under these circumstances, interpretation is based upon an implicit mental model of how and why events normally transpire in the country for which the analyst is responsible. Accuracy of judgment depends almost exclusively

upon accuracy of the mental model, for there is little other basis for judgment.

It is necessary to consider how this mental model gets tested against reality, and how it can be changed to improve the accuracy of analytical judgment. Two things make it hard to change one's mental model. The first is the nature of human perception and information-processing. The second is the difficulty, in many fields, of learning what truly is an accurate model.

Partly because of the nature of human perception and information-processing, beliefs of all types tend to resist change. This is especially true of the implicit assumptions and supposedly self-evident truths that play an important role in forming mental models. Analysts are often surprised to learn that what are to them self-evident truths are by no means self-evident to others, or that self-evident truth at one point in time may be commonly regarded as uninformed assumption 10 years later.

Information that is consistent with an existing mind-set is perceived and processed easily and reinforces existing beliefs. Because the mind strives instinctively for consistency, information that is inconsistent with an existing mental image tends to be overlooked, perceived in a distorted manner, or rationalized to fit existing assumptions and beliefs.[63]

Learning to make better judgments through experience assumes systematic feedback on the accuracy of previous judgments and an ability to link the accuracy of a judgment with the particular configuration of variables that prompted an analyst to make that judgment. In practice, intelligence analysts get little systematic feedback, and even when they learn that an event they had foreseen has actually occurred or failed to occur, they typically do not know for certain whether this happened for the reasons they had foreseen. Thus, an analyst's personal experience may be a poor guide to revision of his or her mental mode.[64]

63. This refers, of course, to subconscious processes. No analyst will consciously distort information that does not fit his or her preconceived beliefs. Important aspects of the perception and processing of new information occur prior to and independently of any conscious direction, and the tendencies described here are largely the result of these subconscious or preconscious processes.

64. A similar point has been made in rebutting the belief in the accumulated wisdom of the classroom teacher. "It is actually very difficult for teachers to profit from experience. They almost never learn about their long-term successes or failures, and their short-term effects are not easily traced to the practices from which they presumably arose." B. F. Skinner, *The Technology of Teaching* (New York: Appleton-Century Crofts, 1968), pp. 112-113.

Mosaic Theory of Analysis

Understanding of the analytic process has been distorted by the mosaic metaphor commonly used to describe it. According to the mosaic theory of intelligence, small pieces of information are collected that, when put together like a mosaic or jigsaw puzzle, eventually enable analysts to perceive a clear picture of reality. The analogy suggests that accurate estimates depend primarily upon having all the pieces, that is, upon accurate and relatively complete information. It is important to collect and store the small pieces of information, as these are the raw material from which the picture is made; one never knows when it will be possible for an astute analyst to fit a piece into the puzzle. Part of the rationale for large technical intelligence collection systems is rooted in this mosaic theory.

Insights from cognitive psychology suggest that intelligence analysts do not work this way and that the most difficult analytical tasks cannot be approached in this manner. Analysts commonly find pieces that appear to fit many different pictures. Instead of a picture emerging from putting all the pieces together, analysts typically form a picture first and then select the pieces to fit. Accurate estimates depend at least as much upon the mental model used in forming the picture as upon the number of pieces of the puzzle that have been collected.

A more accurate analogy for describing how intelligence analysis should work is medical diagnosis. The doctor observes indicators (symptoms) of what is happening, uses his or her specialized knowledge of how the body works to develop hypotheses that might explain these observations, conducts tests to collect additional information to evaluate the hypotheses, then makes a diagnosis. This medical analogy focuses attention on the ability to identify and evaluate all plausible hypotheses. Collection is focused narrowly on information that will help to discriminate the relative probability of alternate hypothesis.

To the extent that this medical analogy is the more appropriate guide to understanding the analytical process, there are implications for the allocation of limited intelligence resources. While analysis and collection are both important, the medical analogy attributes more value to analysis and less to collection than the mosaic metaphor.

Conclusions

To the leaders and managers of intelligence who seek an improved intelligence product, these findings offer a reminder that this goal can be achieved by improving analysis as well as collection. There appear to be inherent practical limits on how much can be gained by efforts to improve collection. By contrast, an open and fertile field exists for imaginative efforts to improve analysis.

These efforts should focus on improving the mental models employed by analysts to interpret information and the analytical processes used to evaluate it. While this will be difficult to achieve, it is so critical to effective intelligence analysis that even small improvements could have large benefits. Specific recommendations are included the next three chapters and in Chapter 14, "Improving Intelligence Analysis."

Chapter 6

Keeping an Open Mind

Minds are like parachutes. They only function when they are open. After reviewing how and why thinking gets channeled into mental ruts, this chapter looks at mental tools to help analysts keep an open mind, question assumptions, see different perspectives, develop new ideas, and recognize when it is time to change their minds.

A new idea is the beginning, not the end, of the creative process. It must jump over many hurdles before being embraced as an organizational product or solution. The organizational climate plays a crucial role in determining whether new ideas bubble to the surface or are suppressed.

* * * * * * * * * * * * * * * * * * * *

Major intelligence failures are usually caused by failures of analysis, not failures of collection. Relevant information is discounted, misinterpreted, ignored, rejected, or overlooked because it fails to fit a prevailing mental model or mind-set.[65] The "signals" are lost in the "noise."[66] How can we ensure that analysts remain open to new experience and recognize

when long-held views or conventional wisdom need to be revised in response to a changing world?

Beliefs, assumptions, concepts, and information retrieved from memory form a mind-set or mental model that guides perception and processing of new information. The nature of the intelligence business forces us to deal with issues at an early stage when hard information is incomplete. If there were no gaps in the information on an issue or situation, and no ambiguity, it would not be an interesting intelligence problem. When information is lacking, analysts often have no choice but to lean heavily on prior beliefs and assumptions about how and why events normally transpire in a given country.

A mind-set is neither good nor bad. It is unavoidable. It is, in essence, a distillation of all that analysts think they know about a subject. It forms a lens through which they perceive the world, and once formed, it resists change.

Understanding Mental Ruts

Chapter 3 on memory suggested thinking of information in memory as somehow interconnected like a massive, multidimensional spider web. It is possible to connect any point within this web to any other point. When analysts connect the same points frequently, they form a path that makes it easier to take that route in the future. Once they start thinking along certain channels, they tend to continue thinking the same way and the path may become a rut. The path seems like the obvious and natural way to go. Information and concepts located near that path are readily available, so the same images keep coming up. Information not located near that path is less likely to come to mind.

Talking about breaking mind-sets, or creativity, or even just openness to new information is really talking about spinning new links and new paths through the web of memory. These are links among facts and concepts, or between schemata for organizing facts or concepts, that were not directly connected or only weakly connected before.

New ideas result from the association of old elements in new combinations. Previously remote elements of thought suddenly become as-

sociated in a new and useful combination.[67] When the linkage is made, the light dawns. This ability to bring previously unrelated information and ideas together in meaningful ways is what marks the open-minded, imaginative, creative analyst.

To illustrate how the mind works, consider my personal experience with a kind of mental block familiar to all analysts—writer's block. I often need to break a mental block when writing. Everything is going along fine until I come to one paragraph and get stuck. I write something down, know it is not quite right, but just cannot think of a better way to say it. However I try to change the paragraph, it still comes out basically the same way. My thinking has become channeled, and I cannot break out of that particular thought pattern to write it differently.

A common response to this problem is to take a break, work on something different for a while, and come back to the difficult portion later. With the passage of time, the path becomes less pronounced and it becomes easier to make other connections.

I have found another solution. I force myself to talk about it out loud. I close the door to my office—I am embarrassed to have anyone hear me talking to myself—and then stand up and walk around and talk. I say, okay, "What is the point of this paragraph? What are you trying to communicate?" I answer myself out loud as though talking to someone else. "The point I am trying to get across is that . . . ," and then it just comes. Saying it out loud breaks the block, and words start coming together in different ways.

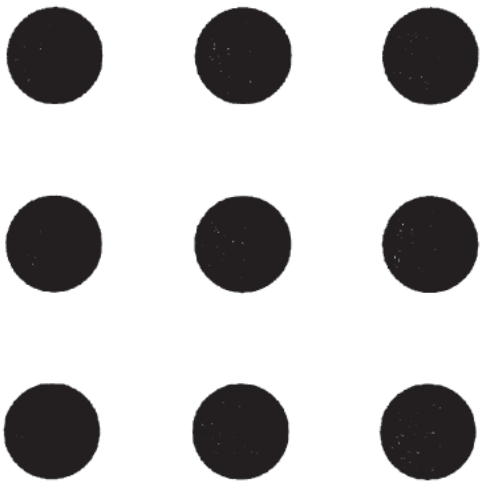
Recent research explains why this happens. Scientists have learned that written language and spoken language are processed in different parts of the brain.[68] They activate different neurons.

Problem-Solving Exercise

Before discussing how analysts can keep their minds open to new information, let us warm up to this topic with a brief exercise. Without lifting pencil from paper, draw no more than four straight lines that will cross through all nine dots in Figure 6.[69]

67. S. A. Mednick, "The Associative Basis of the Creative Process," *Psychological Review*, Vol. 69 (1962), p. 221.
68. Jerry E. Bishop, "Stroke Patients Yield Clues to Brain's Ability to Create Language," *Wall Street Journal*, Oct. 12, 1993, p.A1.
69. The puzzle is from James L. Adams, *Conceptual Blockbusting: A Guide to Better Ideas*. Second Edition (New York: W. W. Norton, 1980), p. 23.

Figure 6



After trying to solve the puzzle on your own, refer to the end of this chapter for answers and further discussion. Then consider that intelligence analysis is too often limited by similar, unconscious, self-imposed constraints or "cages of the mind."

You do not need to be constrained by conventional wisdom. It is often wrong. You do not *necessarily* need to be constrained by existing policies. They can sometimes be changed if you show a good reason for doing so. You do not *necessarily* need to be constrained by the specific analytical requirement you were given. The policymaker who originated the requirement may not have thought through his or her needs or the requirement may be somewhat garbled as it passes down through several echelons to you to do the work. You may have a better understanding than the policymaker of what he or she needs, or should have, or what is possible to do. You should not hesitate to go back up the chain of command with a suggestion for doing something a little different than what was asked for.

Mental Tools

People use various physical tools such as a hammer and saw to enhance their capacity to perform various physical tasks. People can also use simple mental tools to enhance their ability to perform mental tasks. These tools help overcome limitations in human mental machinery for perception, memory, and inference. The next few sections of this chapter discuss mental tools for opening analysts' minds to new ideas, while the next one (Chapter 7) deals with mental tools for structuring complex analytical problems.

Questioning Assumptions

It is a truism that analysts need to question their assumptions. Experience tells us that when analytical judgments turn out to be wrong, it usually was not because the information was wrong. It was because an analyst made one or more faulty assumptions that went unchallenged. The problem is that analysts cannot question everything, so where do they focus their attention?

Sensitivity Analysis. One approach is to do an informal sensitivity analysis. How sensitive is the ultimate judgment to changes in any of the major variables or driving forces in the analysis? Those linchpin assumptions that drive the analysis are the ones that need to be questioned. Analysts should ask themselves what could happen to make any of these assumptions out of date, and how they can know this has not already happened. They should try to disprove their assumptions rather than confirm them. If an analyst cannot think of anything that would cause a change of mind, his or her mind-set may be so deeply entrenched that the analyst cannot see the conflicting evidence. One advantage of the competing hypotheses approach discussed in Chapter 8 is that it helps identify the linchpin assumptions that swing a conclusion in one direction or another.

Identify Alternative Models. Analysts should try to identify alternative models, conceptual frameworks, or interpretations of the data by seeking out individuals who disagree with them rather than those who agree. Most people do not do that very often. It is much more comfortable to talk with people in one's own office who share the same basic mind-set. There are a few things that can be done as a matter of policy,

and that have been done in some offices in the past, to help overcome this tendency.

At least one Directorate of Intelligence component, for example, has had a peer review process in which none of the reviewers was from the branch that produced the report. The rationale for this was that an analyst's immediate colleagues and supervisor(s) are likely to share a common mind-set. Hence these are the individuals least likely to raise fundamental issues challenging the validity of the analysis. To avoid this mind-set problem, each research report was reviewed by a committee of three analysts from other branches handling other countries or issues. None of them had specialized knowledge of the subject. They were, however, highly accomplished analysts. Precisely because they had not been immersed in the issue in question, they were better able to identify hidden assumptions and other alternatives, and to judge whether the analysis adequately supported the conclusions.

Be Wary of Mirror Images. One kind of assumption an analyst should always recognize and question is mirror-imaging—filling gaps in the analyst's own knowledge by assuming that the other side is likely to act in a certain way because that is how the US would act under similar circumstances. To say, "if I were a Russian intelligence officer . . ." or "if I were running the Indian Government . . ." is mirror-imaging. Analysts may have to do that when they do not know how the Russian intelligence officer or the Indian Government is really thinking. But mirror-imaging leads to dangerous assumptions, because people in other cultures *do not* think the way we do. The frequent assumption that they do is what Adm. David Jeremiah, after reviewing the Intelligence Community failure to predict India's nuclear weapons testing, termed the "everybody-thinks-like-us mind-set."[70]

Failure to understand that others perceive their national interests differently from the way we perceive those interests is a constant source of problems in intelligence analysis. In 1977, for example, the Intelligence Community was faced with evidence of what appeared to be a South African nuclear weapons test site. Many in the Intelligence Community, especially those least knowledgeable about South Africa, tended to dismiss this evidence on the grounds that "Pretoria would not want a nucle-

70. Jim Wolf, "CIA Inquest Finds US Missed Indian `Mindset'," UPI wire service, June 3, 1998.

ar weapon, because there is no enemy they could effectively use it on."[71] The US perspective on what is in another country's national interest is usually irrelevant in intelligence analysis. Judgment must be based on how the other country perceives its national interest. If the analyst cannot gain insight into what the other country is thinking, mirror-imaging may be the only alternative, but analysts should never get caught putting much confidence in that kind of judgment.

Seeing Different Perspectives

Another problem area is looking at familiar data from a different perspective. If you play chess, you know you can see your own options pretty well. It is much more difficult to see all the pieces on the board as your opponent sees them, and to anticipate how your opponent will react to your move. That is the situation analysts are in when they try to see how the US Government's actions look from another country's perspective. Analysts constantly have to move back and forth, first seeing the situation from the US perspective and then from the other country's perspective. This is difficult to do, as you experienced with the picture of the old woman/young woman in Chapter 2 on perception.

Several techniques for seeing alternative perspectives exploit the general principle of coming at the problem from a different direction and asking different questions. These techniques break your existing mind-set by causing you to play a different and unaccustomed role.

Thinking Backwards. One technique for exploring new ground is thinking backwards. As an intellectual exercise, start with an assumption that some event you did not expect has actually occurred. Then, put yourself into the future, looking back to explain how this could have happened. Think what must have happened six months or a year earlier to set the stage for that outcome, what must have happened six months or a year before that to prepare the way, and so on back to the present.

Thinking backwards changes the focus from whether something might happen to how it might happen. Putting yourself into the future creates a different perspective that keeps you from getting anchored in the present. Analysts will often find, to their surprise, that they can construct a quite plausible scenario for an event they had previously thought unlikely. Thinking backwards is particularly helpful for events that have

71. Discussion with Robert Jaster, former National Intelligence Officer for Southern Africa.

a low probability but very serious consequences should they occur, such as a collapse or overthrow of the Saudi monarchy.

Crystal Ball. The crystal ball approach works in much the same way as thinking backwards.[72] Imagine that a "perfect" intelligence source (such as a crystal ball) has told you a certain assumption is wrong. You must then develop a scenario to explain how this could be true. If you can develop a plausible scenario, this suggests your assumption is open to some question.

Role playing. Role playing is commonly used to overcome constraints and inhibitions that limit the range of one's thinking. Playing a role changes "where you sit." It also gives one license to think and act differently. Simply trying to imagine how another leader or country will think and react, which analysts do frequently, is not role playing. One must actually act out the role and become, in a sense, the person whose role is assumed. It is only "living" the role that breaks an analyst's normal mental set and permits him or her to relate facts and ideas to each other in ways that differ from habitual patterns. An analyst cannot be expected to do this alone; some group interaction is required, with different analysts playing different roles, usually in the context of an organized simulation or game.

Most of the gaming done in the Defense Department and in the academic world is rather elaborate and requires substantial preparatory work. It does not have to be that way. The preparatory work can be avoided by starting the game with the current situation already known to analysts, rather than with a notional scenario that participants have to learn. Just one notional intelligence report is sufficient to start the action in the game. In my experience, it is possible to have a useful political game in just one day with almost no investment in preparatory work.

Gaming gives no "right" answer, but it usually causes the players to see some things in a new light. Players become very conscious that "where you stand depends on where you sit." By changing roles, the participants see the problem in a different context. This frees the mind to think differently.

Devil's Advocate. A devil's advocate is someone who defends a minority point of view. He or she may not necessarily agree with that view,

72. Jon Fallesen, Rex Michel, James Lussier, and Julia Pounds, "Practical Thinking: Innovation in Battle Command Instruction" *(Technical Report 1037, US Army Research Institute for the Behavioral and Social Sciences*, January 1996).

but may choose or be assigned to represent it as strenuously as possible. The goal is to expose conflicting interpretations and show how alternative assumptions and images make the world look different. It often requires time, energy, and commitment to see how the world looks from a different perspective.[73]

Imagine that you are the boss at a US facility overseas and are worried about the possibility of a terrorist attack. A standard staff response would be to review existing measures and judge their adequacy. There might well be pressure—subtle or otherwise—from those responsible for such arrangements to find them satisfactory. An alternative or supplementary approach would be to name an individual or small group as a devil's advocate assigned to develop actual plans for launching such an attack. The assignment to think like a terrorist liberates the designated person(s) to think unconventionally and be less inhibited about finding weaknesses in the system that might embarrass colleagues, because uncovering any such weaknesses is the assigned task.

Devil's advocacy has a controversial history in the Intelligence Community. Suffice it to say that some competition between conflicting views is healthy and must be encouraged; all-out political battle is counterproductive.

Recognizing When To Change Your Mind

As a general rule, people are too slow to change an established view, as opposed to being too willing to change. The human mind is conservative. It resists change. Assumptions that worked well in the past continue to be applied to new situations long after they have become outmoded.

Learning from Surprise. A study of senior managers in industry identified how some successful managers counteract this conservative bent. They do it, according to the study,

> By paying attention to their feelings of surprise when a particular fact does not fit their prior understanding, and then by highlighting rather than denying the novelty. Although surprise made them feel uncomfortable, it made them take the cause [of the surprise] seriously and inquire into it. . . . Rather than

73. For an interesting discussion of the strengths and potential weaknesses of the "devil's advocate" approach, see Robert Jervis, *Perception and Misperception in International Politics* (Princeton, NJ: Princeton University Press, 1976), pp. 415-418.

> deny, downplay, or ignore disconfirmation [of their prior view], successful senior managers often treat it as friendly and in a way cherish the discomfort surprise creates. As a result, these managers often perceive novel situations early on and in a frame of mind relatively undistorted by hidebound notions.[74]

Analysts should keep a record of unexpected events and think hard about what they might mean, not disregard them or explain them away. It is important to consider whether these surprises, however small, are consistent with some alternative hypothesis. One unexpected event may be easy to disregard, but a pattern of surprises may be the first clue that your understanding of what is happening requires some adjustment, is at best incomplete, and may be quite wrong.

Strategic Assumptions vs. Tactical Indicators. Abraham Ben-Zvi analyzed five cases of intelligence failure to foresee a surprise attack.[75] He made a useful distinction between estimates based on strategic assumptions and estimates based on tactical indications. Examples of strategic assumptions include the US belief in 1941 that Japan wished to avoid war at all costs because it recognized US military superiority, and the Israeli belief in 1973 that the Arabs would not attack Israel until they obtained sufficient air power to secure control of the skies. A more recent instance was the 1998 Indian nuclear test, which was widely viewed as a surprise and, at least in part, as a failure by the experts to warn of an impending test. The incorrect strategic assumption was that the new Indian Government would be dissuaded from testing nuclear weapons for fear of US economic sanctions.[76]

Tactical indicators are specific reports of preparations or intent to initiate hostile action or, in the recent Indian case, reports of preparations for a nuclear test. Ben-Zvi found that whenever strategic assumptions and tactical indicators of impending attack converged, an immediate threat was perceived and appropriate precautionary measures were taken.

74. Daniel J. Isenberg, "How Senior Managers Think," in David Bell, Howard Raiffa, and Amos Tversky, *Decision Making: Descriptive, Normative, and Prescriptive Interactions* (Cambridge University Press, 1988), p. 535.
75. Abraham Ben Zvi, "Hindsight and Foresight: A Conceptual Framework for the Analysis of Surprise Attacks," *World Politics*, April 1976.
76. Transcript of Admiral David Jeremiah's news conference on the Intelligence Community's performance concerning the Indian nuclear test, fourth and fifth paragraphs and first Q and A, 2 June 1998.

When discrepancies existed between tactical indicators and strategic assumptions in the five cases Ben-Zvi analyzed, the strategic assumptions always prevailed, and they were never reevaluated in the light of the increasing flow of contradictory information. Ben-Zvi concludes that tactical indicators should be given increased weight in the decisionmaking process. At a minimum, the emergence of tactical indicators that contradict our strategic assumption should trigger a higher level of intelligence alert. It may indicate that a bigger surprise is on the way.

Chapter 8, "Analysis of Competing Hypotheses," provides a framework for identifying surprises and weighing tactical indicators and other forms of current evidence against longstanding assumptions and beliefs.

Stimulating Creative Thinking

Imagination and creativity play important roles in intelligence analysis as in most other human endeavors. Intelligence judgments require the ability to imagine possible causes and outcomes of a current situation. All possible outcomes are not given. The analyst must think of them by imagining scenarios that explicate how they might come about. Similarly, imagination as well as knowledge is required to reconstruct how a problem appears from the viewpoint of a foreign government. Creativity is required to question things that have long been taken for granted. The fact that apples fall from trees was well known to everyone. Newton's creative genius was to ask "why?" Intelligence analysts, too, are expected to raise new questions that lead to the identification of previously unrecognized relationships or to possible outcomes that had not previously been foreseen.

A creative analytical product shows a flair for devising imaginative or innovative—but also accurate and effective—ways to fulfill any of the major requirements of analysis: gathering information, analyzing information, documenting evidence, and/or presenting conclusions. Tapping unusual sources of data, asking new questions, applying unusual analytic methods, and developing new types of products or new ways of fitting analysis to the needs of consumers are all examples of creative activity.

A person's intelligence, as measured by IQ tests, has little to do with creativity, but the organizational environment exercises a major influence. New but appropriate ideas are most likely to arise in an organizational climate that nurtures their development and communication.

The old view that creativity is something one is born with, and that it cannot be taught or developed, is largely untrue. While native talent, per se, is important and may be immutable, it is possible to learn to employ one's innate talents more productively. With understanding, practice, and conscious effort, analysts can learn to produce more imaginative, innovative, creative work.

There is a large body of literature on creativity and how to stimulate it. At least a half-dozen different methods have been developed for teaching, facilitating, or liberating creative thinking. All the methods for teaching or facilitating creativity are based on the assumption that the *process* of thinking can be separated from the *content* of thought. One learns mental strategies that can be applied to any subject.

It is not our purpose here to review commercially available programs for enhancing creativity. Such programmatic approaches can be applied more meaningfully to problems of new product development, advertising, or management than to intelligence analysis. It is relevant, however, to discuss several key principles and techniques that these programs have in common, and that individual intelligence analysts or groups of analysts can apply in their work.

Intelligence analysts must generate ideas concerning potential causes or explanations of events, policies that might be pursued or actions taken by a foreign government, possible outcomes of an existing situation, and variables that will influence which outcome actually comes to pass. Analysts also need help to jog them out of mental ruts, to stimulate their memories and imaginations, and to perceive familiar events from a new perspective.

Here are some of the principles and techniques of creative thinking that can be applied to intelligence analysis.

Deferred Judgment. The principle of deferred judgment is undoubtedly the most important. The idea-generation phase of analysis should be separated from the idea-evaluation phase, with evaluation deferred until all possible ideas have been brought out. This approach runs contrary to the normal procedure of thinking of ideas and evaluating them concurrently. Stimulating the imagination and critical thinking are both important, but they do not mix well. A judgmental attitude dampens the imagination, whether it manifests itself as self-censorship of one's own ideas or fear of critical evaluation by colleagues or supervisors. Idea generation should be a freewheeling, unconstrained, uncritical process.

New ideas are, by definition, unconventional, and therefore likely to be suppressed, either consciously or unconsciously, unless they are born in a secure and protected environment. Critical judgment should be suspended until after the idea-generation stage of analysis has been completed. A series of ideas should be written down and then evaluated later. This applies to idea searching by individuals as well as brainstorming in a group. Get all the ideas out on the table before evaluating any of them.

Quantity Leads to Quality. A second principle is that quantity of ideas eventually leads to quality. This is based on the assumption that the first ideas that come to mind will be those that are most common or usual. It is necessary to run through these conventional ideas before arriving at original or different ones. People have habitual ways of thinking, ways that they continue to use because they have seemed successful in the past. It may well be that these habitual responses, the ones that come first to mind, are the best responses and that further search is unnecessary. In looking for usable new ideas, however, one should seek to generate as many ideas as possible before evaluating any of them.

No Self-Imposed Constraints. A third principle is that thinking should be allowed—indeed encouraged—to range as freely as possible. It is necessary to free oneself from self-imposed constraints, whether they stem from analytical habit, limited perspective, social norms, emotional blocks, or whatever.

Cross-Fertilization of Ideas. A fourth principle of creative problem-solving is that cross-fertilization of ideas is important and necessary. Ideas should be combined with each other to form more and even better ideas. If creative thinking involves forging new links between previously unrelated or weakly related concepts, then creativity will be stimulated by any activity that brings more concepts into juxtaposition with each other in fresh ways. Interaction with other analysts is one basic mechanism for this. As a general rule, people generate more creative ideas when teamed up with others; they help to build and develop each other's ideas. Personal interaction stimulates new associations between ideas. It also induces greater effort and helps maintain concentration on the task.

These favorable comments on group processes are not meant to encompass standard committee meetings or coordination processes that force consensus based on the lowest common denominator of agreement. My positive words about group interaction apply primarily to

brainstorming sessions aimed at generating new ideas and in which, according to the first principle discussed above, all criticism and evaluation are deferred until after the idea generation stage is completed.

Thinking things out alone also has its advantages: individual thought tends to be more structured and systematic than interaction within a group. Optimal results come from alternating between individual thinking and team effort, using group interaction to generate ideas that supplement individual thought. A diverse group is clearly preferable to a homogeneous one. Some group participants should be analysts who are not close to the problem, inasmuch as their ideas are more likely to reflect different insights.

Idea Evaluation. All creativity techniques are concerned with stimulating the flow of ideas. There are no comparable techniques for determining which ideas are best. The procedures are, therefore, aimed at idea generation rather than idea evaluation. The same procedures do aid in evaluation, however, in the sense that ability to generate more alternatives helps one see more potential consequences, repercussions, and effects that any single idea or action might entail.

Organizational Environment

A new idea is not the end product of the creative process. Rather, it is the beginning of what is sometimes a long and tortuous process of translating an idea into an innovative product. The idea must be developed, evaluated, and communicated to others, and this process is influenced by the organizational setting in which it transpires. The potentially useful new idea must pass over a number of hurdles before it is embraced as an organizational product.

The following paragraphs describe in some detail research conducted by Frank Andrews to investigate the relationship among creative ability, organizational setting, and innovative research products.[77] The subjects of this research were 115 scientists, each of whom had directed a research project dealing with social-psychological aspects of disease. These scientists were given standardized tests that measure creative ability and intelligence. They were also asked to fill out an extensive questionnaire

77. Frank M. Andrews, "Social and Psychological Factors Which Influence the Creative Process," in Irving A. Taylor and Jacob W. Getzels, eds., *Perspectives in Creativity* (Chicago, Aldine Publishing, 1975).

concerning the environment in which their research was conducted. A panel of judges composed of the leading scientists in the field of medical sociology was asked to evaluate the principal published results from each of the 115 research projects.

Judges evaluated the research results on the basis of productivity and innovation. Productivity was defined as the "extent to which the research represents an addition to knowledge along established lines of research or as extensions of previous theory." Innovativeness was defined as "additions to knowledge through new lines of research or the development of new theoretical statements of findings that were not explicit in previous theory.[78] Innovation, in other words, involved raising new questions and developing new approaches to the acquisition of knowledge, as distinct from working productively within an already established framework. This same definition applies to innovation in intelligence analysis.

Andrews found virtually no relationship between the scientists' creative ability and the innovativeness of their research. (There was also no relationship between level of intelligence and innovativeness.) Those who scored high on tests of creative ability did not necessarily receive high ratings from the judges evaluating the innovativeness of their work. A possible explanation is that either creative ability or innovation, or both, were not measured accurately, but Andrews argues persuasively for another view. Various social and psychological factors have so great an effect on the steps needed to translate creative ability into an innovative research product that there is no measurable effect traceable to creative ability alone. In order to document this conclusion, Andrews analyzed data from the questionnaires in which the scientists described their work environment.

Andrews found that scientists possessing more creative ability produced more innovative work only under the following favorable conditions:

- When the scientist perceived himself or herself as responsible for initiating new activities. The opportunity for innovation, and the encouragement of it, are—not surprisingly—important variables.

78. Ibid., p. 122.

- When the scientist had considerable control over decisionmaking concerning his or her research program—in other words, the freedom to set goals, hire research assistants, and expend funds. Under these circumstances, a new idea is less likely to be snuffed out before it can be developed into a creative and useful product.

- When the scientist felt secure and comfortable in his or her professional role. New ideas are often disruptive, and pursuing them carries the risk of failure. People are more likely to advance new ideas if they feel secure in their positions.

- When the scientist's administrative superior "stayed out of the way." Research is likely to be more innovative when the superior limits himself or herself to support and facilitation rather than direct involvement.

- When the project was relatively small with respect to the number of people involved, budget, and duration. Small size promotes flexibility, and this in turn is more conducive to creativity.

- When the scientist engaged in other activities, such as teaching or administration, in addition to the research project. Other work may provide useful stimulation or help one identify opportunities for developing or implementing new ideas. Some time away from the task, or an incubation period, is generally recognized as part of the creative process."

The importance of any one of these factors was not very great, but their impact was cumulative. The presence of all or most of these conditions exerted a strongly favorable influence on the creative process. Conversely, the absence of these conditions made it quite unlikely that even highly creative scientists could develop their new ideas into innovative research results. Under unfavorable conditions, the most creatively inclined scientists produced even less innovative work than their less imaginative colleagues, presumably because they experienced greater frustration with their work environment.

In summary, some degree of innate creative talent may be a necessary precondition for innovative work, but it is unlikely to be of much value unless the organizational environment in which that work is done nurtures the development and communication of new ideas. Under unfavorable circumstances, an individual's creative impulses probably will find expression outside the organization.

There are, of course, exceptions to the rule. Some creativity occurs even in the face of intense opposition. A hostile environment can be stimulating, enlivening, and challenging. Some people gain satisfaction from viewing themselves as lonely fighters in the wilderness, but when it comes to conflict between a large organization and a creative individual within it, the organization generally wins.

Recognizing the role of organizational environment in stimulating or suppressing creativity points the way to one obvious set of measures to enhance creative organizational performance. Managers of analysis, from first-echelon supervisors to the Director of Central Intelligence, should take steps to strengthen and broaden the perception among analysts that new ideas are welcome. This is not easy; creativity implies criticism of that which already exists. It is, therefore, inherently disruptive of established ideas and organizational practices.

Particularly within his or her own office, an analyst needs to enjoy a sense of security, so that partially developed ideas may be expressed and bounced off others as sounding boards with minimal fear of criticism or ridicule for deviating from established orthodoxy. At its inception, a new idea is frail and vulnerable. It needs to be nurtured, developed, and tested in a protected environment before being exposed to the harsh reality of public criticism. It is the responsibility of an analyst's immediate supervisor and office colleagues to provide this sheltered environment.

Conclusions

Creativity, in the sense of new and useful ideas, is at least as important in intelligence analysis as in any other human endeavor. Procedures to enhance innovative thinking are not new. Creative thinkers have employed them successfully for centuries. The only new elements—and even they may not be new anymore—are the grounding of these procedures in psychological theory to explain how and why they work, and their formalization in systematic creativity programs.

Learning creative problem-solving techniques does not change an analyst's native-born talents but helps an analyst achieve his or her full potential. Most people have the ability to be more innovative than they themselves realize. The effectiveness of these procedures depends, in large measure, upon the analyst's motivation, drive, and perseverance in taking the time required for thoughtful analysis despite the pressures of day-to-day duties, mail, and current intelligence reporting.

A questioning attitude is a prerequisite to a successful search for new ideas. Any analyst who is confident that he or she already knows the answer, and that this answer has not changed recently, is unlikely to produce innovative or imaginative work. Another prerequisite to creativity is sufficient strength of character to suggest new ideas to others, possibly at the expense of being rejected or even ridiculed on occasion. "The ideas of creative people often lead them into direct conflict with the trends of their time, and they need the courage to be able to stand alone."[79]

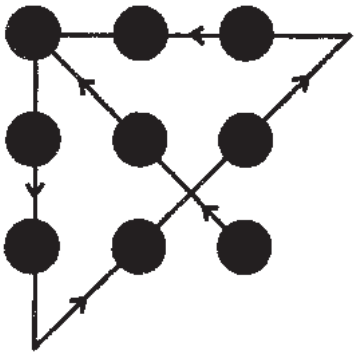
SOLUTIONS TO PUZZLE PRESENTED IN FIGURE 6

Figure 6

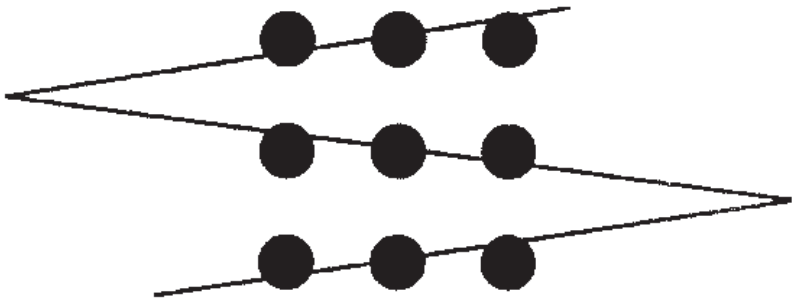
The nine-dots puzzle illustrated in Figure 6 above and earlier in this chapter is difficult to solve only if one defines the problem to narrowly. A surprising number of people assume they are not supposed to let the pencil go outside an imaginary square drawn around the nine dots.

Figure 7



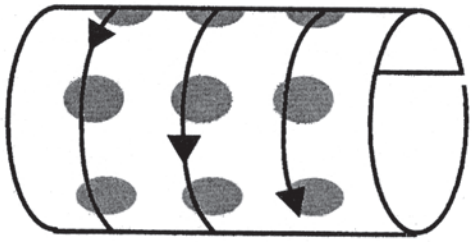
This unconscious constraint exists only in the mind of the problem-solver; it is not specified in the definition of the problem. With no limit on the length of lines, it should be relatively easy to come up with the answer shown in Figure 7.

Figure 8



Another common, unconscious constraint is the assumption that the lines must pass through the center of the dots. This constraint, too, exists only in the mind of the problem solver. Without it, the three-line solution in Figure 8 becomes rather obvious.

Figure 9



A more subtle and certainly more pervasive mental block is the assumption that such problems must be solved within a two-dimensional-plane. By rolling the paper to form a cylinder, it becomes possible to draw a single straight line that spirals through all nine dots, as in Figure 9.

Chapter 7

Structuring Analytical Problems

This chapter discusses various structures for decomposing and externalizing complex analytical problems when we cannot keep all the relevant factors in the forefront of our consciousness at the same time.

Decomposition means breaking a problem down into its component parts. Externalization means getting the problem out of our heads and into some visible form that we can work with.

* * * * * * * * * * * * * * * * * * * *

The discussion of working memory in Chapter 3 indicated that "The Magic Number Seven—Plus or Minus Two"[80] is the number of things most people can keep in working memory at one time. To experience firsthand this limitation on working memory while doing a mental task, try multiplying in your head any pair of two-digit numbers- for example, 46 times 78. On paper, this is a simple problem, but most people cannot keep track of that many numbers in their head.

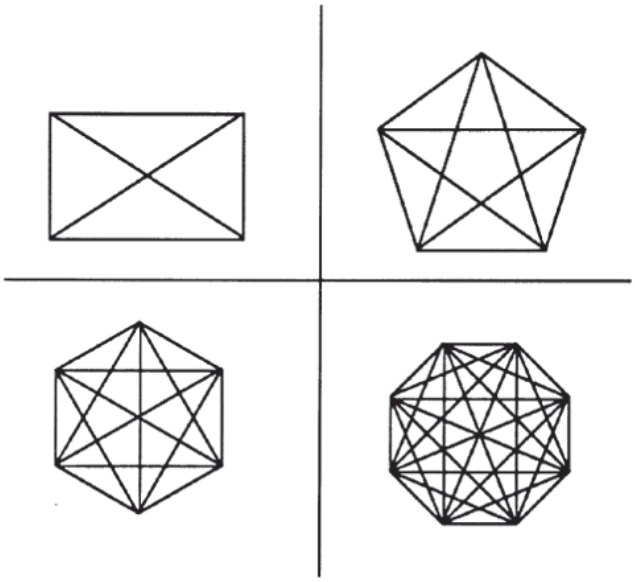
The limited capacity of working memory is the source of many problems in doing intelligence analysis. It is useful to consider just how complicated analysis can get, and how complexity might outstrip your working memory and impede your ability to make accurate judgments. Figure 10 illustrates how complexity increases geometrically as the number of variables in an analytical problem increases. The four-sided square shows that when a problem has just four variables, there are six possible interrelationships between those variables. With the pentagon, the five variables have 10 possible interrelationships. With six and eight variables, respectively, there are 15 and 28 possible interrelationships between variables.

The number of possible relationships between variables grows geometrically as the number of variables increases.

There are two basic tools for dealing with complexity in analysis—decomposition and externalization.

80. George A. Miller, "The Magical Number Seven, Plus or Minus Two: Some Limits on our Capacity for Processing Information." *The Psychological Review*, Vol. 63, No. 2 (March 1956).

Figure 10



The number of possible relationships between variables grows geometrically as the number of variables increases.

Decomposition means breaking a problem down into its component parts. That is, indeed, the essence of analysis. Webster's Dictionary defines analysis as division of a complex whole into its parts or elements.[81]

The spirit of decision analysis is to divide and conquer: Decompose a complex problem into simpler problems, get one's thinking straight in these simpler problems, paste these analyses together with a logical glue . . .[82]

Externalization means getting the decomposed problem out of one's head and down on paper or on a computer screen in some simplified form that shows the main variables, parameters, or elements of the problem and how they relate to each other. Writing down the multiplication problem, 46 times 78, is a very simple example of externalizing an ana-

81. *Webster's Ninth New Collegiate Dictionary*, 1988.
82. Howard Raiffa, *Decision Analysis* (Reading, MA: Addison-Wesley, 1968).

lytical problem. When it is down on paper, one can easily manipulate one part of the problem at a time and often be more accurate than when trying to multiply the numbers in one's head.

I call this drawing a picture of your problem. Others call it making a model of your problem. It can be as simple as just making lists pro and con.

This recommendation to compensate for limitations of working memory by decomposing and externalizing analytical problems is not new. The following quote is from a letter Benjamin Franklin wrote in 1772 to the great British scientist Joseph Priestley, the discoverer of oxygen:

> In the affair of so much importance to you, wherein you ask my advice, I cannot for want of sufficient premises, advise you what to determine, but if you please I will tell you how. When those difficult cases occur, they are difficult, chiefly because while we have them under consideration, all the reasons pro and con are not present to the mind at the same time, but sometimes one set present themselves, and at other times another, the first being out of sight. Hence the various purposes or inclinations that alternatively prevail, and the uncertainty that perplexes us.
>
> To get over this, my way is to divide half a sheet of paper by a line into two columns; writing over the one Pro, and over the other Con. Then, during three or four days of consideration, I put down under the different heads short hints of the different motives, that at different times occur to me, for or against the measure.
>
> When I have thus got them all together in one view, I endeavor to estimate their respective weights; and where I find two, one on each side, that seem equal, I strike them both out. If I find a reason pro equal to some two reasons con, I strike out the three . . . and thus proceeding I find at length where the balance lies; and if, after a day or two of further consideration, nothing new that is of importance occurs on either side, I come to a determination accordingly.

> And, though the weight of reasons cannot be taken with the precision of algebraic quantities, yet when each is thus considered, separately and comparatively, and the whole lies before me, I think I can judge better, and am less liable to make a rash step, and in fact I have found great advantage from this kind of equation. . . . [83]

It is noteworthy that Franklin over 200 years ago ident2ified the problem of limited working memory and how it affects one's ability to make judgments. As Franklin noted, decision problems are difficult because people cannot keep all the pros and cons in mind at the same time. We focus first on one set of arguments and then on another, ". . . hence the various purposes and inclinations that alternatively prevail, and the uncertainty that perplexes us."

Franklin also identified the solution—getting all the pros and cons out of his head and onto paper in some visible, shorthand form. The fact that this topic was part of the dialogue between such illustrious individuals reflects the type of people who use such analytical tools. These are not aids to be used by weak analysts but unneeded by the strong. Basic limitations of working memory affect everyone. It is the more astute and careful analysts who are most conscious of this and most likely to recognize the value gained by applying these very simple tools.

Putting ideas into visible form ensures that they will last. They will lie around for days goading you into having further thoughts. Lists are effective because they exploit people's tendency to be a bit compulsive—we want to keep adding to them. They let us get the obvious and habitual answers out of the way, so that we can add to the list by thinking of other ideas beyond those that came first to mind. One specialist in creativity has observed that "for the purpose of moving our minds, pencils can serve as crowbars"[84]—just by writing things down and making lists that stimulate new associations.

With the key elements of a problem written down in some abbreviated form, it is far easier to work with each of the parts while still keeping the problem as a whole in view. Analysts can generally take account of more factors than when making a global judgment. They can manipulate

83. J. Bigelow, ed., *The Complete Works of Benjamin Franklin* (New York: Putnam, 1887), p. 522.
84. Alex Osborn, *Applied Imagination*, Revised Edition (New York: Scribner's, 1979), p. 202.

individual elements of the problem to examine the many alternatives available through rearranging, combining, or modifying them. Variables may be given more weight or deleted, causal relationships reconceptualized, or conceptual categories redefined. Such thoughts may arise spontaneously, but they are more likely to occur when an analyst looks at each element, one by one, and asks questions designed to encourage and facilitate consideration of alternative interpretations.

Problem Structure

Anything that has parts also has a structure that relates these parts to each other. One of the first steps in doing analysis is to determine an appropriate structure for the analytical problem, so that one can then identify the various parts and begin assembling information on them. Because there are many different kinds of analytical problems, there are also many different ways to structure analysis.

Lists such as Franklin made are one of the simplest structures. An intelligence analyst might make lists of relevant variables, early warning indicators, alternative explanations, possible outcomes, factors a foreign leader will need to take into account when making a decision, or arguments for and against a given explanation or outcome.

Other tools for structuring a problem include outlines, tables, diagrams, trees, and matrices, with many sub-species of each. For example, trees include decision trees and fault trees. Diagrams includes causal diagrams, influence diagrams, flow charts, and cognitive maps.

Consideration of all those tools is beyond the scope of this book, but several such tools are discussed. Chapter 11, "Biases in Perception of Cause and Effect," has a section on Illusory Correlation that uses a (2x2) contingency table to structure analysis of the question: Is deception most likely when the stakes are very high? Chapter 8, "Analysis of Competing Hypotheses," is arguably the most useful chapter in this book. It recommends using a matrix to array evidence for and against competing hypotheses to explain what is happening now or estimate what may happen in the future.

The discussion below also uses a matrix to illustrate decomposition and externalization and is intended to prepare you for the next chapter on "Analysis of Competing Hypotheses." It demonstrates how to apply

these tools to a type of decision commonly encountered in our personal lives.

Car Purchase Matrix

In choosing among alternative purchases, such as when buying a car, a new computer, or a house, people often want to maximize their satisfaction on a number of sometimes-conflicting dimensions. They want a car at the lowest possible price, with the lowest maintenance cost, highest resale value, slickest styling, best handling, best gas mileage, largest trunk space, and so forth. They can't have it all, so they must decide what is most important and make tradeoffs. As Ben Franklin said, the choice is sometimes difficult. We vacillate between one choice and another, because we cannot keep in working memory at the same time all the characteristics of all the choices. We think first of one and then the other.

To handle this problem analytically, follow the divide-and-conquer principle and "draw a picture" of the problem as a whole that helps you identify and make the tradeoffs. The component parts of the car purchase problem are the cars you are considering buying and the attributes or dimensions you want to maximize. After identifying the desirable attributes that will influence your decision, weigh how each car stacks up on each attribute. A matrix is the appropriate tool for keeping track of your judgments about each car and each attribute, and then putting all the parts back together to make a decision.

Start by listing the important attributes you want to maximize, as shown for example in Figure 11.

Figure 11

Price

Maintenance Cost

Styling

Gas Mileage

Comfort

Handling

Next, quantify the relative importance of each attribute by dividing 100 percent among them. In other words, ask yourself what percentage of the decision should be based on price, on styling, etc. This forces you to ask relevant questions and make decisions you might have glossed over if you had not broken the problem down in this manner. How important is price versus styling, really? Do you really care what it looks like from the outside, or are you mainly looking for comfort on the inside and how

Figure 12

Price	**30%**
Operating Cost	**10%**
Styling	**20%**
Comfort	**20%**
Handling	**15%**
Safety	**5%**
Total	**100%**

it drives? Should safety be included in your list of important attributes? Because poor gas mileage can be offset by lower maintenance cost for repairs, perhaps both should be combined into a single attribute called operating cost.

This step might produce a result similar to Figure 12, depending on your personal preferences. If you do this together with your spouse, the exact basis of any difference of opinion will become immediately apparent and can be quantified.

Figure 13

	% Value	Car 1	Car 2	Car 3
Price	30%	3.5%	3.0%	3.5%
Operating Cost	10%	3.5%	2.0%	4.5%
Styling	20%	2.5%	4.5%	3.0%
Comfort	20%	4.0%	2.5%	3.5%
Handling	15%	3.0%	4.0%	3.0%
Safety	5%	3.5%	2.5%	4%

Next, identify the cars you are considering and judge how each one ranks on each of the six attributes shown in Figure 12. Set up a matrix as shown in Figure 13 and work across the rows of the matrix. For each attribute, take 10 points and divide it among the three cars based on how well they meet the requirements of that attribute. (This is the same as taking 100 percent and dividing it among the cars, but it keeps the numbers lower when you get to the next step.)

You now have a picture of your analytical problem—the comparative value you attribute to each of the principal attributes of a new car and a comparison of how various cars satisfy those desired attributes. If you have narrowed it down to three alternatives, your matrix will look something like Figure 13:

When all the cells of the matrix have been filled in, you can then calculate which car best suits your preferences. Multiply the percentage value you assigned to each attribute by the value you assigned to that attribute for each car, which produces the result in Figure 14. If the percentage values you assigned to each attribute accurately reflect your preferences, and if each car has been analyzed accurately, the analysis shows you will gain more satisfaction from the purchase of Car 3 than either of the alternatives.

Figure 14

	% Value	Car 1	Car 2	Car 3
Price	30%	105	90	105
Operating Cost	10%	35	20	45
Styling	20%	50	90	60
Comfort	20%	80	50	70
Handling	15%	45	60	45
Safety	5%	17.5	12.5	20
Totals		332.5	322.5	345

At this point, you do a sensitivity analysis to determine whether plausible changes in some values in the matrix would swing the decision to a different car. Assume, for example, that your spouse places different values than you on the relative importance of price versus styling. You can insert your spouse's percentage values for those two attributes and see if that makes a difference in the decision. (For example, one could reduce the importance of price to 20 percent and increase styling to 30 percent. That is still not quite enough to switch the choice to Car 2, which rates highest on styling.)

There is a technical name for this type of analysis. It is called Multiattribute Utility Analysis, and there are complex computer programs for doing it. In simplified form, however, it requires only pencil and paper and high school arithmetic. It is an appropriate structure for any purchase decision in which you must make tradeoffs between multiple competing preferences.

Conclusions

The car purchase example was a warmup for the following chapter. It illustrates the difference between just sitting down and thinking about a problem and really *analyzing* a problem. The essence of analysis is breaking down a problem into its component parts, assessing each part separately, then putting the parts back together to make a decision. The matrix in this example forms a "picture" of a complex problem by getting it out of our head and onto paper in a logical form that enables you to consider each of the parts individually.

You certainly would not want to do this type of analysis for all your everyday personal decisions or for every intelligence judgment. You may wish to do it, however, for an especially important, difficult, or controversial judgment, or when you need to leave an audit trail showing how you arrived at a judgment. The next chapter applies decomposition, externalization, and the matrix structure to a common type of intelligence problem.

Chapter 8

Analysis of Competing Hypotheses

Analysis of competing hypotheses, sometimes abbreviated ACH, is a tool to aid judgment on important issues requiring careful weighing of alternative explanations or conclusions. It helps an analyst overcome, or at least minimize, some of the cognitive limitations that make prescient intelligence analysis so difficult to achieve.

ACH is an eight-step procedure grounded in basic insights from cognitive psychology, decision analysis, and the scientific method. It is a surprisingly effective, proven process that helps analysts avoid common analytic pitfalls. Because of its thoroughness, it is particularly appropriate for controversial issues when analysts want to leave an audit trail to show what they considered and how they arrived at their judgment.[85]

* * * * * * * * * * * * * * * * * * * *

When working on difficult intelligence issues, analysts are, in effect, choosing among several alternative hypotheses. Which of several possible explanations is the correct one? Which of several possible outcomes is the most likely one? As previously noted, this book uses the term "hypothesis" in its broadest sense as a potential explanation or conclusion that is to be tested by collecting and presenting evidence.

Analysis of competing hypotheses (ACH) requires an analyst to explicitly identify all the reasonable alternatives and have them compete against each other for the analyst's favor, rather than evaluating their plausibility one at a time.

The way most analysts go about their business is to pick out what they suspect intuitively is the most likely answer, then look at the available information from the point of view of whether or not it supports this answer. If the evidence seems to support the favorite hypothesis,

85. The analysis of competing hypotheses procedure was developed by the author for use by intelligence analysts dealing with a set of particularly difficult problems.

analysts pat themselves on the back ("See, I knew it all along!") and look no further. If it does not, they either reject the evidence as misleading or develop another hypothesis and go through the same procedure again. Decision analysts call this a satisficing strategy. (See Chapter 4, Strategies for Analytical Judgment.) Satisficing means picking the first solution that seems satisfactory, rather than going through all the possibilities to identify the very best solution. There may be several seemingly satisfactory solutions, but there is only one best solution.

Chapter 4 discussed the weaknesses in this approach. The principal concern is that if analysts focus mainly on trying to confirm one hypothesis they think is probably true, they can easily be led astray by the fact that there is so much evidence to support their point of view. They fail to recognize that most of this evidence is also consistent with other explanations or conclusions, and that these other alternatives have not been refuted.

Simultaneous evaluation of multiple, competing hypotheses is very difficult to do. To retain three to five or even seven hypotheses in working memory and note how each item of information fits into each hypothesis is beyond the mental capabilities of most people. It takes far greater mental agility than listing evidence supporting a single hypothesis that was pre-judged as the most likely answer. It can be accomplished, though, with the help of the simple procedures discussed here. The box below contains a step-by-step outline of the ACH process.

Step 1

Identify the possible hypotheses to be considered. Use a group of analysts with different perspectives to brainstorm the possibilities.

Psychological research into how people go about generating hypotheses shows that people are actually rather poor at thinking of all the possibilities.[86] If a person does not even generate the correct hypothesis for consideration, obviously he or she will not get the correct answer.

86. Charles Gettys et al., *Hypothesis Generation: A Final Report on Three Years of Research*, Technical Report 15-10-80 (University of Oklahoma, Decision Processes Laboratory, 1980).

Step-by-Step Outline of Analysis of Competing Hypotheses

1. Identify the possible hypotheses to be considered. Use a group of analysts with different perspectives to brainstorm the possibilities.

2. Make a list of significant evidence and arguments for and against each hypothesis.

3. Prepare a matrix with hypotheses across the top and evidence down the side. Analyze the "diagnosticity" of the evidence and arguments—that is, identify which items are most helpful in judging the relative likelihood of the hypotheses.

4. Refine the matrix. Reconsider the hypotheses and delete evidence and arguments that have no diagnostic value.

5. Draw tentative conclusions about the relative likelihood of each hypothesis. Proceed by trying to disprove the hypotheses rather than prove them.

6. Analyze how sensitive your conclusion is to a few critical items of evidence. Consider the consequences for your analysis if that evidence were wrong, misleading, or subject to a different interpretation.

7. Report conclusions. Discuss the relative likelihood of all the hypotheses, not just the most likely one.

8. Identify milestones for future observation that may indicate events are taking a different course than expected.

It is useful to make a clear distinction between the hypothesis generation and hypothesis evaluation stages of analysis. Step 1 of the recommended analytical process is to identify all hypotheses that merit detailed examination. At this early hypothesis generation stage, it is very useful to bring together a group of analysts with different backgrounds and perspectives. Brainstorming in a group stimulates the imagination and

may bring out possibilities that individual members of the group had not thought of. Initial discussion in the group should elicit every possibility, no matter how remote, before judging likelihood or feasibility. Only when all the possibilities are on the table should you then focus on judging them and selecting the hypotheses to be examined in greater detail in subsequent analysis.

When screening out the seemingly improbable hypotheses that you do not want to waste time on, it is necessary to distinguish hypotheses that appear to be *disproved* from those that are simply *unproven*. For an unproven hypothesis, there is no evidence that it is correct. For a disproved hypothesis, there is positive evidence that it is wrong. As discussed in Chapter 4, "Strategies for Analytical Judgment," and under Step 5 below, you should seek evidence that *disproves* hypotheses. Early rejection of unproven, but not disproved, hypotheses biases the subsequent analysis, because one does not then look for the evidence that might support them. Unproven hypotheses should be kept alive until they can be disproved.

One example of a hypothesis that often falls into this unproven but not disproved category is the hypothesis that an opponent is trying to deceive us. You may reject the possibility of denial and deception because you see no evidence of it, but rejection is not justified under these circumstances. If deception is planned well and properly implemented, one should not expect to find evidence of it readily at hand. The possibility should not be rejected until it is disproved, or, at least, until after a systematic search for evidence has been made and none has been found.

There is no "correct" number of hypotheses to be considered. The number depends upon the nature of the analytical problem and how advanced you are in the analysis of it. As a general rule, the greater your level of uncertainty, or the greater the policy impact of your conclusion, the more alternatives you may wish to consider. More than seven hypotheses may be unmanageable; if there are this many alternatives, it may be advisable to group several of them together for your initial cut at the analysis.

Step 2

Make a list of significant evidence and arguments for and against each hypothesis.

In assembling the list of relevant evidence and arguments, these terms should be interpreted very broadly. They refer to all the factors that have an impact on your judgments about the hypotheses. Do not limit yourself to concrete evidence in the current intelligence reporting. Also include your own assumptions or logical deductions about another person's or group's or country's intentions, goals, or standard procedures. These assumptions may generate strong preconceptions as to which hypothesis is most likely. Such assumptions often drive your final judgment, so it is important to include them in the list of "evidence."

First, list the general evidence that applies to all the hypotheses. Then consider each hypothesis individually, listing factors that tend to support or contradict each one. You will commonly find that each hypothesis leads you to ask different questions and, therefore, to seek out somewhat different evidence.

For each hypothesis, ask yourself this question: If this hypothesis is true, what should I expect to be seeing or not seeing? What are all the things that must have happened, or may still be happening, and that one should expect to see evidence of? If you are not seeing this evidence, why not? Is it because it has not happened, it is not normally observable, it is being concealed from you, or because you or the intelligence collectors have not looked for it?

Note the absence of evidence as well as its presence. For example, when weighing the possibility of military attack by an adversary, the steps the adversary has not taken to ready his forces for attack may be more significant than the observable steps that have been taken. This recalls the Sherlock Holmes story in which the vital clue was that the dog did *not* bark in the night. One's attention tends to focus on what is reported rather than what is not reported. It requires a conscious effort to think about what is missing but should be present if a given hypothesis were true.

Step 3

Prepare a matrix with hypotheses across the top and evidence down the side. Analyze the "diagnosticity" of the evidence and arguments- that is, identify which items are most helpful in judging the relative likelihood of alternative hypotheses.

Step 3 is perhaps the most important element of this analytical procedure. It is also the step that differs most from the natural, intuitive approach to analysis, and, therefore, the step you are most likely to overlook or misunderstand.

The procedure for Step 3 is to take the hypotheses from Step 1 and the evidence and arguments from Step 2 and put this information into a matrix format, with the hypotheses across the top and evidence and arguments down the side. This gives an overview of all the significant components of your analytical problem.

Then analyze how each piece of evidence relates to each hypothesis. This differs from the normal procedure, which is to look at one hypothesis at a time in order to consider how well the evidence supports that hypothesis. That will be done later, in Step 5. At this point, in Step 3, take one item of evidence at a time, then consider how consistent that evidence is with each of the hypotheses. Here is how to remember this distinction. In Step 3, you work *across* the rows of the matrix, examining one item of evidence at a time to see how consistent that item of evidence is with each of the hypotheses. In Step 5, you work *down* the columns of the matrix, examining one hypothesis at a time, to see how consistent that hypothesis is with all the evidence.

To fill in the matrix, take the first item of evidence and ask whether it is consistent with, inconsistent with, or irrelevant to each hypothesis. Then make a notation accordingly in the appropriate cell under each hypothesis in the matrix. The form of these notations in the matrix is a matter of personal preference. It may be pluses, minuses, and question marks. It may be C, I, and N/A standing for consistent, inconsistent, or not applicable. Or it may be some textual notation. In any event, it will be a simplification, a shorthand representation of the complex reasoning that went on as you thought about how the evidence relates to each hypothesis.

After doing this for the first item of evidence, then go on to the next item of evidence and repeat the process until all cells in the ma-

trix are filled. Figure 15 shows an example of how such a matrix might look. It uses as an example the intelligence question that arose after the US bombing of Iraqi intelligence headquarters in 1993: Will Iraq retaliate? The evidence in the matrix and how it is evaluated are hypothetical, fabricated for the purpose of providing a plausible example of the procedure. The matrix does not reflect actual evidence or judgments available at that time to the US Intelligence Community.

Figure 15

Question: Will Iraq Retaliate for US Bombing of Its Intelligence Headquarters?

Hypotheses:
H1 - Iraq will not retaliate.
H2 - It will sponsor some minor terrorist actions.
H3 - Iraq is planning a major terrorist attack, perhaps against one or more CIA installations.

	H1	H2	H3
E1. Saddam public statement of intent not to retaliate.	+	+	+
E2. Absence of terrorist offensive during the 1991 Gulf War.	+	+	−
E3. Assumption that Iraq would not want to provoke another US attack.	+	+	−
E4. Increase in frequency/length of monitored Iraqi agent radio broadcasts.	−	+	+
E5. Iraqi embassies instructed to take increased security precautions.	−	+	+
E6. Assumption that failure to retaliate would be unacceptable loss of face for Saddam.	−−	+	+

The matrix format helps you weigh the *diagnosticity* of each item of evidence, which is a key difference between analysis of competing hypotheses and traditional analysis. Diagnosticity of evidence is an important concept that is, unfortunately, unfamiliar to many analysts. It was introduced in Chapter 4, and that discussion is repeated here for your convenience.

Diagnosticity may be illustrated by a medical analogy. A high-temperature reading may have great value in telling a doctor that a patient is sick, but relatively little value in determining which illness a person is suffering from. Because a high temperature is consistent with so many possible hypotheses about a patient's illness, this evidence has limited diagnostic value in determining which illness (hypothesis) is the more likely one.

Evidence is diagnostic when it influences your judgment on the *relative* likelihood of the various hypotheses identified in Step 1. If an item of evidence seems consistent with all the hypotheses, it may have no diagnostic value. A common experience is to discover that most of the evidence supporting what you believe is the most likely hypothesis really is not very helpful, because that same evidence is also consistent with other hypotheses. When you do identify items that are highly diagnostic, these should drive your judgment. These are also the items for which you should re-check accuracy and consider alternative interpretations, as discussed in Step 6.

In the hypothetical matrix dealing with Iraqi intentions, note that evidence designated "E1" is assessed as consistent with all of the hypotheses. In other words, it has no diagnostic value. This is because we did not give any credence to Saddam's public statement on this question. He might say he will not retaliate but then do so, or state that he will retaliate and then not do it. On the other hand, E4 is diagnostic: increased frequency or length of Iraqi agent radio broadcasts is more likely to be observed if the Iraqis are planning retaliation than if they are not. The double minus for E6 indicates this is considered a very strong argument against H1. It is a linchpin assumption that drives the conclusion in favor of either H2 or H3. Several of the judgments reflected in this matrix will be questioned at a later stage in this analysis.

In some cases it may be useful to refine this procedure by using a numerical probability, rather than a general notation such as plus or minus, to describe how the evidence relates to each hypothesis. To do this, ask the following question for each cell in the matrix: If this hypothesis is true, what is the probability that I would be seeing this item of evidence? You may also make one or more additional notations in each cell of the matrix, such as:

- Adding a scale to show the intrinsic importance of each item of evidence.

- Adding a scale to show the ease with which items of evidence could be concealed, manipulated, or faked, or the extent to which one party might have an incentive to do so. This may be appropriate when the possibility of denial and deception is a serious issue.

Step 4

Refine the matrix. Reconsider the hypotheses and delete evidence and arguments that have no diagnostic value.

The exact wording of the hypotheses is obviously critical to the conclusions one can draw from the analysis. By this point, you will have seen how the evidence breaks out under each hypothesis, and it will often be appropriate to reconsider and reword the hypotheses. Are there hypotheses that need to be added, or finer distinctions that need to be made in order to consider all the significant alternatives? If there is little orno evidence that helps distinguish between two hypotheses, should they be combined into one?

Also reconsider the evidence. Is your thinking about which hypotheses are most likely and least likely influenced by factors that are not included in the listing of evidence? If so, put them in. Delete from the matrix items of evidence or assumptions that now seem unimportant or have no diagnostic value. Save these items in a separate list as a record of information that was considered.

Step 5

Draw tentative conclusions about the relative likelihood of each hypothesis. Proceed by trying to disprove hypotheses rather than prove them.

In Step 3, you worked across the matrix, focusing on a single item of evidence or argument and examining how it relates to each hypothesis. Now, work down the matrix, looking at each hypothesis as a whole. The matrix format gives an overview of all the evidence for and against all the hypotheses, so that you can examine all the hypotheses together and have them compete against each other for your favor.

In evaluating the relative likelihood of alternative hypotheses, start by looking for evidence or logical deductions that enable you to reject hypotheses, or at least to determine that they are unlikely. A fundamental precept of the scientific method is to proceed by rejecting or eliminating hypotheses, while tentatively accepting only those hypotheses that cannot be refuted. The scientific method obviously cannot be applied *in toto* to intuitive judgment, but the principle of seeking to disprove hypotheses, rather than confirm them, is useful.

No matter how much information is consistent with a given hypothesis, one cannot prove that hypothesis is true, because the same information may also be consistent with one or more other hypotheses. On the other hand, a single item of evidence that is inconsistent with a hypothesis may be sufficient grounds for rejecting that hypothesis. This was discussed in detail in Chapter 4, "Strategies for Analytical Judgment."

People have a natural tendency to concentrate on confirming hypotheses they already believe to be true, and they commonly give more weight to information that supports a hypothesis than to information that weakens it. This is wrong; we should do just the opposite. Step 5 again requires doing the *opposite* of what comes naturally.

In examining the matrix, look at the minuses, or whatever other notation you used to indicate evidence that may be inconsistent with a hypothesis. The hypotheses with the fewest minuses is probably the most likely one. The hypothesis with the most minuses is probably the least likely one. The fact that a hypothesis is inconsistent with the evidence is certainly a sound basis for rejecting it. The pluses, indicating evidence that is consistent with a hypothesis, are far less significant. It does not follow that the hypothesis with the most pluses is the most likely one, because a long list of evidence that is consistent with almost any reasonable hypothesis can be easily made. What is difficult to find, and is most significant when found, is hard evidence that is clearly inconsistent with a reasonable hypothesis.

This initial ranking by number of minuses is only a rough ranking, however, as some evidence obviously is more important than other evidence, and degrees of inconsistency cannot be captured by a single notation such as a plus or minus. By reconsidering the exact nature of the relationship between the evidence and the hypotheses, you will be able to judge how much weight to give it.

Analysts who follow this procedure often realize that their judgments are actually based on very few factors rather than on the large mass of information they thought was influencing their views. Chapter 5, "Do You Really Need More Information?," makes this same point based on experimental evidence.

The matrix should *not* dictate the conclusion to you. Rather, it should accurately reflect your judgment of what is important and how these important factors relate to the probability of each hypothesis. You, not the matrix, must make the decision. The matrix serves only as an aid to thinking and analysis, to ensure consideration of all the possible interrelationships between evidence and hypotheses and identification of those few items that really swing your judgment on the issue.

When the matrix shows that a given hypothesis is probable or unlikely, you may disagree. If so, it is because you omitted from the matrix one or more factors that have an important influence on your thinking. Go back and put them in, so that the analysis reflects your best judgment. If following this procedure has caused you to consider things you might otherwise have overlooked, or has caused you to revise your earlier estimate of the relative probabilities of the hypotheses, then the procedure has served a useful purpose. When you are done, the matrix serves as a shorthand record of your thinking and as an audit trail showing how you arrived at your conclusion.

This procedure forces you to spend more analytical time than you otherwise would on what you had thought were the less likely hypotheses. This is desirable. The seemingly less likely hypotheses usually involve plowing new ground and, therefore, require more work. What you started out thinking was the most likely hypothesis tends to be based on a continuation of your own past thinking. A principal advantage of the analysis of competing hypotheses is that it forces you to give a fairer shake to all the alternatives.

Step 6

Analyze how sensitive your conclusion is to a few critical items of evidence. Consider the consequences for your analysis if that evidence were wrong, misleading, or subject to a different interpretation.

In Step 3 you identified the evidence and arguments that were most diagnostic, and in Step 5 you used these findings to make tentative judgments about the hypotheses. Now, go back and question the few linchpin assumptions or items of evidence that really drive the outcome of your analysis in one direction or the other. Are there questionable assumptions that underlie your understanding and interpretation? Are there alternative explanations or interpretations? Could the evidence be incomplete and, therefore, misleading?

If there is any concern at all about denial and deception, this is an appropriate place to consider that possibility. Look at the sources of your key evidence. Are any of the sources known to the authorities in the foreign country? Could the information have been manipulated? Put yourself in the shoes of a foreign deception planner to evaluate motive, opportunity, means, costs, and benefits of deception as they might appear to the foreign country.

When analysis turns out to be wrong, it is often because of key assumptions that went unchallenged and proved invalid. It is a truism that analysts should identify and question assumptions, but this is much easier said than done. The problem is to determine which assumptions merit questioning. One advantage of the ACH procedure is that it tells you what needs to be rechecked.

In Step 6 you may decide that additional research is needed to check key judgments. For example, it may be appropriate to go back to check original source materials rather than relying on someone else's interpretation. In writing your report, it is desirable to identify critical assumptions that went into your interpretation and to note that your conclusion is dependent upon the validity of these assumptions.

Step 7

Report conclusions. Discuss the relative likelihood of all the hypotheses, not just the most likely one.

If your report is to be used as the basis for decisionmaking, it will be helpful for the decisionmaker to know the relative likelihood of all the alternative possibilities. Analytical judgments are never certain. There is always a good possibility of their being wrong. Decisionmakers need to make decisions on the basis of a full set of alternative possibilities, not

just the single most likely alternative. Contingency or fallback plans may be needed in case one of the less likely alternatives turns out to be true.

If you say that a certain hypothesis is probably true, that could mean anywhere from a 55-percent to an 85-percent chance that future events will prove it correct. That leaves anywhere from a 15-percent to 45 percent possibility that a decision based on your judgment will be based on faulty assumptions and will turn out wrong. Can you be more specific about how confident you are in your judgment? Chapter 12, "Biases in Estimating Probabilities," discusses the difference between such "subjective probability" judgments and statistical probabilities based on data on relative frequencies.

When one recognizes the importance of proceeding by eliminating rather than confirming hypotheses, it becomes apparent that any written argument for a certain judgment is incomplete unless it also discusses alternative judgments that were considered and why they were rejected. In the past, at least, this was seldom done.

The narrative essay, which is the dominant art form for the presentation of intelligence judgments, does not lend itself to comparative evaluation of competing hypotheses. Consideration of alternatives adds to the length of reports and is perceived by many analysts as detracting from the persuasiveness of argument for the judgment chosen. Analysts may fear that the reader could fasten on one of the rejected alternatives as a good idea. Discussion of alternative hypotheses is nonetheless an important part of any intelligence appraisal, and ways can and should be found to include it.

Step 8

Identify milestones for future observation that may indicate events are taking a different course than expected.

Analytical conclusions should always be regarded as tentative. The situation may change, or it may remain unchanged while you receive new information that alters your appraisal. It is always helpful to specify in advance things one should look for or be alert to that, if observed, would suggest a significant change in the probabilities. This is useful for

intelligence consumers who are following the situation on a continuing basis. Specifying in advance what would cause you to change your mind will also make it more difficult for you to rationalize such developments, if they occur, as not really requiring any modification of your judgment.

Summary and Conclusion

Three key elements distinguish analysis of competing hypotheses from conventional intuitive analysis.

- Analysis starts with a full set of alternative possibilities, rather than with a most likely alternative for which the analyst seeks confirmation. This ensures that alternative hypotheses receive equal treatment and a fair shake.

- Analysis identifies and emphasizes the few items of evidence or assumptions that have the greatest diagnostic value in judging the relative likelihood of the alternative hypotheses. In conventional intuitive analysis, the fact that key evidence may also be consistent with alternative hypotheses is rarely considered explicitly and often ignored.

- Analysis of competing hypotheses involves seeking evidence to refute hypotheses. The most probable hypothesis is usually the one with the least evidence against it, not the one with the most evidence for it. Conventional analysis generally entails looking for evidence to confirm a favored hypothesis.

The analytical effectiveness of this procedure becomes apparent when considering the Indian nuclear weapons testing in 1998. According to Admiral Jeremiah, the Intelligence Community had reported that " there was no indication the Indians would test in the near term."[87] Such a conclusion by the Community would fail to distinguish an unproven hypothesis from a disproved hypothesis. An absence of evidence does not necessarily disprove the hypothesis that India will indeed test nuclear weapons.

87. Transcript of Adm. Jeremiah's news conference, last sentence of third paragraph, 2 June 1998.

If the ACH procedure had been used, one of the hypotheses would certainly have been that India is planning to test in the near term but will conceal preparations for the testing to forestall international pressure to halt such preparations.

Careful consideration of this alternative hypothesis would have required evaluating India's motive, opportunity, and means for concealing its intention until it was too late for the US and others to intervene. It would also have required assessing the ability of US intelligence to see through Indian denial and deception if it were being employed. It is hard to imagine that this would not have elevated awareness of the possibility of successful Indian deception.

A principal lesson is this. Whenever an intelligence analyst is tempted to write the phrase "there is no evidence that . . . ," the analyst should ask this question: If this hypothesis is true, can I realistically expect to see evidence of it? In other words, if India were planning nuclear tests while deliberately concealing its intentions, could the analyst realistically expect to see evidence of test planning? The ACH procedure leads the analyst to identify and face these kinds of questions.

Once you have gained practice in applying analysis of competing hypotheses, it is quite possible to integrate the basic concepts of this procedure into your normal analytical thought process. In that case, the entire eight-step procedure may be unnecessary, except on highly controversial issues.

There is no guarantee that ACH or any other procedure will produce a correct answer. The result, after all, still depends on fallible intuitive judgment applied to incomplete and ambiguous information. **Analysis of competing hypotheses does, however, guarantee an appropriate *process of analysis. This procedure leads you through a rational, systematic process that avoids some common analytical pitfalls. It increases the odds of getting the right answer, and it leaves an audit trail showing the evidence used in your analysis and how this evidence was interpreted. If others disagree with your judgment, the matrix can be used to highlight the precise area of disagreement. Subsequent discussion can then focus productively on the ultimate source of the differences.***

A common experience is that analysis of competing hypotheses attributes greater likelihood to alternative hypotheses than would conventional analysis. One becomes less confident of what one thought one

knew. In focusing more attention on alternative explanations, the procedure brings out the full uncertainty inherent in any situation that is poor in data but rich in possibilities. Although such uncertainty is frustrating, it may be an accurate reflection of the true situation. As Voltaire said, "Doubt is not a pleasant state, but certainty is a ridiculous one."[88]

The ACH procedure has the offsetting advantage of focusing attention on the few items of critical evidence that cause the uncertainty or which, if they were available, would alleviate it. This can guide future collection, research, and analysis to resolve the uncertainty and produce a more accurate judgment.

PART III—COGNITIVE BIASES

Chapter 9

What Are Cognitive Biases?

This mini-chapter discusses the nature of cognitive biases in general. The four chapters that follow it describe specific cognitive biases in the evaluation of evidence, perception of cause and effect, estimation of probabilities, and evaluation of intelligence reporting.

* * * * * * * * * * * * * * * * * * * *

Fundamental limitations in human mental processes were identified in Chapters 2 and 3. A substantial body of research in cognitive psychology and decisionmaking is based on the premise that these cognitive limitations cause people to employ various simplifying strategies and rules of thumb to ease the burden of mentally processing information to make judgments and decisions.[89] These simple rules of thumb are often useful in helping us deal with complexity and ambiguity. Under many circumstances, however, they lead to predictably faulty judgments known as cognitive biases.

Cognitive biases are mental errors caused by our simplified information processing strategies. It is important to distinguish cognitive biases from other forms of bias, such as cultural bias, organizational bias, or bias that results from one's own self-interest. In other words, a cognitive bias does not result from any emotional or intellectual predisposition toward a certain judgment, but rather from subconscious mental procedures for processing information. A cognitive bias is a mental error that is consistent and predictable. For example:

89. Much of this research was stimulated by the seminal work of Amos Tversky and Daniel Kahneman, "Judgment under Uncertainty: Heuristics and Biases," *Science*, 27 September 1974, Vol. 185, pp. 1124-1131. It has been summarized by Robin Hogarth, *Judgement and Choice* (New York: John Wiley & Sons, 1980), Richard Nisbett and Lee Ross, *Human Inference: Strategies and Shortcomings of Human Judgment* (Englewood Cliffs, NJ: Prentice-Hall, 1980), and Robyn Dawes, *Rational Choice in an Uncertain World* (New York: Harcourt Brace Jovanovich College Publishers, 1988). The Hogarth book contains an excellent bibliography of research in this field, organized by subject.

> The apparent distance of an object is determined in part by its clarity. The more sharply the object is seen, the closer it appears to be. This rule has some validity, because in any given scene the more distant objects are seen less sharply than nearer objects. However, the reliance on this rule leads to systematic errors in estimation of distance. Specifically, distances are often overestimated when visibility is poor because the contours of objects are blurred. On the other hand, distances are often underestimated when visibility is good because the objects are seen sharply. Thus the reliance on clarity as an indication of distance leads to common biases.[90]

This rule of thumb about judging distance is very useful. It usually works and helps us deal with the ambiguity and complexity of life around us. Under certain predictable circumstances, however, it will lead to biased judgment.

Cognitive biases are similar to optical illusions in that the error remains compelling even when one is fully aware of its nature. Awareness of the bias, by itself, does not produce a more accurate perception. Cognitive biases, therefore, are, exceedingly difficult to overcome.

Psychologists have conducted many experiments to identify the simplifying rules of thumb that people use to make judgments on incomplete or ambiguous information, and to show—at least in laboratory situations—how these rules of thumb prejudice judgments and decisions. The following four chapters discuss cognitive biases that are particularly pertinent to intelligence analysis because they affect the evaluation of evidence, perception of cause and effect, estimation of probabilities, and retrospective evaluation of intelligence reports.

Before discussing the specific biases, it is appropriate to consider the nature of such experimental evidence and the extent to which one can generalize from these experiments to conclude that the same biases are prevalent in the Intelligence Community.

When psychological experiments reveal the existence of a bias, this does not mean that every judgment by every individual person will be biased. It means that in any group of people, the bias will exist to a greater or lesser degree in most judgments made by most of the group. On the basis of this kind of experimental evidence, one can only generalize about

90. Tversky and Kahneman, ibid.

the tendencies of groups of people, not make statements about how any specific individual will think.

I believe that conclusions based on these laboratory experiments can be generalized to apply to intelligence analysts. In most, although not all cases, the test subjects were experts in their field. They were physicians, stock market analysts, horserace handicappers, chess masters, research directors, and professional psychologists, not undergraduate students as in so many psychological experiments. In most cases, the mental tasks performed in these experiments were realistic; that is, they were comparable to the judgments that specialists in these fields are normally required to make.

Some margin for error always exists when extrapolating from experimental laboratory to real-world experience, but classes of CIA analysts to whom these ideas were presented found them relevant and enlightening. I replicated a number of the simpler experiments with military officers in the National Security Affairs Department of the Naval Postgraduate School.

Chapter 10

Biases in Evaluation of Evidence

Evaluation of evidence is a crucial step in analysis, but what evidence people rely on and how they interpret it are influenced by a variety of extraneous factors. Information presented in vivid and concrete detail often has unwarranted impact, and people tend to disregard abstract or statistical information that may have greater evidential value. We seldom take the absence of evidence into account. The human mind is also oversensitive to the consistency of the evidence, and insufficiently sensitive to the reliability of the evidence. Finally, impressions often remain even after the evidence on which they are based has been totally discredited.[91]

* * * * * * * * * * * * * * * * * * * *

The intelligence analyst works in a somewhat unique informational environment. Evidence comes from an unusually diverse set of sources: newspapers and wire services, observations by American Embassy officers, reports from controlled agents and casual informants, information exchanges with foreign governments, photo reconnaissance, and communications intelligence. Each source has its own unique strengths, weaknesses, potential or actual biases, and vulnerability to manipulation and deception. The most salient characteristic of the information environment is its diversity—multiple sources, each with varying degrees of reliability, and each commonly reporting information which by itself is incomplete and sometimes inconsistent or even incompatible with reporting from other sources. Conflicting information of uncertain reliability is endemic to intelligence analysis, as is the need to make rapid judgments on current events even before all the evidence is in.

The analyst has only limited control over the stream of information. Tasking of sources to report on specific subjects is often a cumbersome and time-consuming process. Evidence on some important topics is sporadic or nonexistent. Most human-source information is second hand at best.

91. An earlier version of this chapter was published as an unclassified article in *Studies in Intelligence* in summer 1981, under the same title.

Recognizing and avoiding biases under such circumstances is particularly difficult. Most of the biases discussed in this chapter are unrelated to each other and are grouped together here only because they all concern some aspect of the evaluation of evidence.

The Vividness Criterion

The impact of information on the human mind is only imperfectly related to its true value as evidence.[92] Specifically, information that is vivid, concrete, and personal has a greater impact on our thinking than pallid, abstract information that may actually have substantially greater value as evidence. For example:

- Information that people perceive directly, that they hear with their own ears or see with their own eyes, is likely to have greater impact than information received secondhand that may have greater evidential value.

- Case histories and anecdotes will have greater impact than more informative but abstract aggregate or statistical data.

Events that people experience personally are more memorable than those they only read about. Concrete words are easier to remember than abstract words,[93] and words of all types are easier to recall than numbers. In short, information having the qualities cited in the preceding paragraph is more likely to attract and hold our attention. It is more likely to be stored and remembered than abstract reasoning or statistical summaries, and therefore can be expected to have a greater immediate effect as well as a continuing impact on our thinking in the future.

Intelligence analysts generally work with secondhand information. The information that analysts receive is mediated by the written words of others rather than perceived directly with their own eyes and ears. Partly because of limitations imposed by their open CIA employment, many intelligence analysts have spent less time in the country they are

92. Most of the ideas and examples in this section are from Richard Nisbett and Lee Ross, *Human Inference: Strategies and Shortcomings of Social Judgment* (Englewood Cliffs, NJ: Prentice-Hall, 1980), Chapter 3.
93. A. Paivio, *Imagery and Verbal Processes* (New York: Holt, Rinehart & Winston, 1971).

analyzing and had fewer contacts with nationals of that country than their academic and other government colleagues. Occasions when an analyst does visit the country whose affairs he or she is analyzing, or speaks directly with a national from that country, are memorable experiences. Such experiences are often a source of new insights, but they can also be deceptive.

That concrete, sensory data do and should enjoy a certain priority when weighing evidence is well established. When an abstract theory or secondhand report is contradicted by personal observation, the latter properly prevails under most circumstances. There are a number of popular adages that advise mistrust of secondhand data: "Don't believe everything you read," "You can prove anything with statistics," "Seeing is believing," "I'm from Missouri. . ."

It is curious that there are no comparable maxims to warn against being misled by our own observations. Seeing should not always be believing.

Personal observations by intelligence analysts and agents can be as deceptive as secondhand accounts. Most individuals visiting foreign countries become familiar with only a small sample of people representing a narrow segment of the total society. Incomplete and distorted perceptions are a common result.

A familiar form of this error is the single, vivid case that outweighs a much larger body of statistical evidence or conclusions reached by abstract reasoning. When a potential car buyer overhears a stranger complaining about how his Volvo turned out to be a lemon, this may have as much impact on the potential buyer's thinking as statistics in *Consumer Reports* on the average annual repair costs for foreign-made cars. If the personal testimony comes from the potential buyer's brother or close friend, it will probably be given even more weight. Yet the logical status of this new information is to increase by one the sample on which the *Consumer Reports* statistics were based; the personal experience of a single Volvo owner has little evidential value.

Nisbett and Ross label this the "man-who" syndrome and provide the following illustrations:[94]

- "But I know a *man who* smoked three packs of cigarettes a day and lived to be ninety-nine."

- "I've never been to Turkey but just last month I met a *man who* had, and he found it . . ."

Needless to say, a "man-who" example seldom merits the evidential weight intended by the person citing the example, or the weight often accorded to it by the recipient.

The most serious implication of vividness as a criterion that determines the impact of evidence is that certain kinds of very valuable evidence will have little influence simply because they are abstract. Statistical data, in particular, lack the rich and concrete detail to evoke vivid images, and they are often overlooked, ignored, or minimized.

For example, the Surgeon General's report linking cigarette smoking to cancer should have, logically, caused a decline in per-capita cigarette consumption. No such decline occurred for more than 20 years. The reaction of physicians was particularly informative. All doctors were aware of the statistical evidence and were more exposed than the general population to the health problems caused by smoking. How they reacted to this evidence depended upon their medical specialty. Twenty years after the Surgeon General's report, radiologists who examine lung x-rays every day had the lowest rate of smoking. Physicians who diagnosed and treated lung cancer victims were also quite unlikely to smoke. Many other types of physicians continued to smoke. The probability that a physician continued to smoke was directly related to the distance of the physician's specialty from the lungs. In other words, even physicians, who were well qualified to understand and appreciate the statistical data, were more influenced by their vivid personal experiences than by valid statistical data.[95]

Personal anecdotes, actual accounts of people's responsiveness or indifference to information sources, and controlled experiments can all be cited *ad infinitum* "to illustrate the proposition that data summaries, de-

94. Nisbett and Ross, p. 56.
95. Ibid.

spite their logically compelling implications, have less impact than does inferior but more vivid evidence."[96] It seems likely that intelligence analysts, too, assign insufficient weight to statistical information.

Analysts should give little weight to anecdotes and personal case histories unless they are known to be typical, and perhaps no weight at all if aggregate data based on a more valid sample can be obtained.

Absence of Evidence

A principal characteristic of intelligence analysis is that key information is often lacking. Analytical problems are selected on the basis of their importance and the perceived needs of the consumers, without much regard for availability of information. Analysts have to do the best they can with what they have, somehow taking into account the fact that much relevant information is known to be missing.

Ideally, intelligence analysts should be able to recognize what relevant evidence is lacking and factor this into their calculations. They should also be able to estimate the potential impact of the missing data and to adjust confidence in their judgment accordingly. Unfortunately, this ideal does not appear to be the norm. Experiments suggest that "out of sight, out of mind" is a better description of the impact of gaps in the evidence.

This problem has been demonstrated using fault trees, which are schematic drawings showing all the things that might go wrong with any endeavor. Fault trees are often used to study the fallibility of complex systems such as a nuclear reactor or space capsule.

A fault tree showing all the reasons why a car might not start was shown to several groups of experienced mechanics.[97] The tree had seven major branches—insufficient battery charge, defective starting system, defective ignition system, defective fuel system, other engine problems, mischievous acts or vandalism, and all other problems—and a number of subcategories under each branch. One group was shown the full tree and asked to imagine 100 cases in which a car won't start. Members of this group were then asked to estimate how many of the 100 cases were

96. Nisbett and Ross, p. 57.
97. Baruch Fischhoff, Paul Slovic, and Sarah Lichtenstein, *Fault Trees: Sensitivity of Estimated Failure Probabilities to Problem Representation*, Technical Report PTR- 1 042-77-8 (Eugene, OR: Decision Research, 1977).

attributable to each of the seven major branches of the tree. A second group of mechanics was shown only an incomplete version of the tree: three major branches were omitted in order to test how sensitive the test subjects were to what was left out.

If the mechanics' judgment had been fully sensitive to the missing information, then the number of cases of failure that would normally be attributed to the omitted branches should have been added to the "Other Problems" category. In practice, however, the "Other Problems" category was increased only half as much as it should have been. This indicated that the mechanics shown the incomplete tree were unable to fully recognize and incorporate into their judgments the fact that some of the causes for a car not starting were missing. When the same experiment was run with non-mechanics, the effect of the missing branches was much greater.

As compared with most questions of intelligence analysis, the "car won't start" experiment involved rather simple analytical judgments based on information that was presented in a well-organized manner. That the presentation of relevant variables in the abbreviated fault tree was incomplete could and should have been recognized by the experienced mechanics selected as test subjects. Intelligence analysts often have similar problems. Missing data is normal in intelligence problems, but it is probably more difficult to recognize that important information is absent and to incorporate this fact into judgments on intelligence questions than in the more concrete "car won't start" experiment.

As an antidote for this problem, analysts should identify explicitly those relevant variables on which information is lacking, consider alternative hypotheses concerning the status of these variables, and then modify their judgment and especially confidence in their judgment accordingly. They should also consider whether the absence of information is normal or is itself an indicator of unusual activity or inactivity.

Oversensitivity to Consistency

The internal consistency in a pattern of evidence helps determine our confidence in judgments based on that evidence.[98] In one sense, consistency is clearly an appropriate guideline for evaluating evidence.

98. Amos Tversky and Daniel Kahneman, "Judgment under Uncertainty: Heuristics and Biases," *Science*, Vol. 185 (27 September 1974), 1126.

People formulate alternative explanations or estimates and select the one that encompasses the greatest amount of evidence within a logically consistent scenario. Under some circumstances, however, consistency can be deceptive. Information may be consistent only because it is highly correlated or redundant, in which case many related reports may be no more informative than a single report. Or it may be consistent only because information is drawn from a very small sample or a biased sample.

Such problems are most likely to arise in intelligence analysis when analysts have little information, say on political attitudes of Russian military officers or among certain African ethnic groups. If the available evidence is consistent, analysts will often overlook the fact that it represents a very small and hence unreliable sample taken from a large and heterogeneous group. This is not simply a matter of necessity—of having to work with the information on hand, however imperfect it may be. Rather, there is an illusion of validity caused by the consistency of the information.

The tendency to place too much reliance on small samples has been dubbed the "law of small numbers."[99] This is a parody on the law of large numbers, the basic statistical principle that says very large samples will be highly representative of the population from which they are drawn. This is the principle that underlies opinion polling, but most people are not good intuitive statisticians. People do not have much intuitive feel for how large a sample has to be before they can draw valid conclusions from it. The so-called law of small numbers means that, intuitively, we make the mistake of treating small samples as though they were large ones.

This has been shown to be true even for mathematical psychologists with extensive training in statistics. Psychologists designing experiments have seriously incorrect notions about the amount of error and unreliability inherent in small samples of data, unwarranted confidence in the early trends from the first few data points, and unreasonably high expectations of being able to repeat the same experiment and get the same results with a different set of test subjects.

Are intelligence analysts also overly confident of conclusions drawn from very little data—especially if the data seem to be consistent? When working with a small but consistent body of evidence, analysts need to consider how representative that evidence is of the total body of poten-

99. Tversky and Kahneman (1974), p. 1125-1126.

tially available information. If more reporting were available, how likely is it that this information, too, would be consistent with the already available evidence? If an analyst is stuck with only a small amount of evidence and cannot determine how representative this evidence is, confidence in judgments based on this evidence should be low regardless of the consistency of the information.

Coping with Evidence of Uncertain Accuracy

There are many reasons why information often is less than perfectly accurate: misunderstanding, misperception, or having only part of the story; bias on the part of the ultimate source; distortion in the reporting chain from subsource through source, case officer, reports officer, to analyst; or misunderstanding and misperception by the analyst. Further, much of the evidence analysts bring to bear in conducting analysis is retrieved from memory, but analysts often cannot remember even the source of information they have in memory let alone the degree of certainty they attributed to the accuracy of that information when it was first received.

The human mind has difficulty coping with complicated probabilistic relationships, so people tend to employ simple rules of thumb that reduce the burden of processing such information. In processing information of uncertain accuracy or reliability, analysts tend to make a simple yes or no decision. If they reject the evidence, they tend to reject it fully, so it plays no further role in their mental calculations. If they accept the evidence, they tend to accept it wholly, ignoring the probabilistic nature of the accuracy or reliability judgment. This is called a "best guess" strategy.[100] Such a strategy simplifies the integration of probabilistic information, but at the expense of ignoring some of the uncertainty. If analysts have information about which they are 70- or 80-percent certain but treat this information as though it were 100-percent certain, judgments based on that information will be overconfident.

A more sophisticated strategy is to make a judgment based on an assumption that the available evidence is perfectly accurate and reliable,

100. See Charles F. Gettys, Clinton W. Kelly III, and Cameron Peterson, "The Best Guess Hypothesis in Multistage Inference," *Organizational Behavior and Human Performance, 10*, 3 (1973), 365-373; and David A. Schum and Wesley M. DuCharme, "Comments on the Relationship Between the Impact and the Reliability of Evidence," *Organizational Behavior and Human Performance, 6* (1971), 111-131.

then reduce the confidence in this judgment by a factor determined by the assessed validity of the information. For example, available evidence may indicate that an event probably (75 percent) will occur, but the analyst cannot be certain that the evidence on which this judgment is based is wholly accurate or reliable. Therefore, the analyst reduces the assessed probability of the event (say, down to 60 percent) to take into account the uncertainty concerning the evidence. This is an improvement over the best-guess strategy but generally still results in judgments that are overconfident when compared with the mathematical formula for calculating probabilities.[101]

In mathematical terms, the joint probability of two events is equal to the product of their individual probabilities. Imagine a situation in which you receive a report on event X that is probably (75 percent) true. *If the report on event X is true,* you judge that event Y will probably (75 percent) happen. The actual probability of Y is only 56 percent, which is derived by multiplying 75 percent times 75 percent.

In practice, life is not nearly so simple. Analysts must consider many items of evidence with different degrees of accuracy and reliability that are related in complex ways with varying degrees of probability to several potential outcomes. Clearly, one cannot make neat mathematical calculations that take all of these probabilistic relationships into account. In making intuitive judgments, we unconsciously seek shortcuts for sorting through this maze, and these shortcuts involve some degree of ignoring the uncertainty inherent in less-than-perfectly-reliable information. There seems to be little an analyst can do about this, short of breaking the analytical problem down in a way that permits assigning probabilities to individual items of information, and then using a mathematical formula to integrate these separate probability judgments.

The same processes may also affect our reaction to information that is plausible but known from the beginning to be of questionable authenticity. Ostensibly private statements by foreign officials are often reported though intelligence channels. In many instances it is not clear whether such a private statement by a foreign ambassador, cabinet member, or other official is an actual statement of private views, an indiscretion, part of a deliberate attempt to deceive the US Government, or part of an ap-

101. Edgar M. Johnson, "The Effect of Data Source Reliability on Intuitive Inference," Technical Paper 251 (Arlington, VA: US Army Research Institute for the Behavioral and Social Sciences, 1974).

proved plan to convey a truthful message that the foreign government believes is best transmitted through informal channels.

The analyst who receives such a report often has little basis for judging the source's motivation, so the information must be judged on its own merits. In making such an assessment, the analyst is influenced by plausible causal linkages. If these are linkages of which the analyst was already aware, the report has little impact inasmuch as it simply supports existing views. If there are plausible new linkages, however, thinking is restructured to take these into account. It seems likely that the impact on the analyst's thinking is determined solely by the substance of the information, and that the caveat concerning the source does not attenuate the impact of the information at all. Knowing that the information comes from an uncontrolled source who may be trying to manipulate us does not necessarily reduce the impact of the information.

Persistence of Impressions Based on Discredited Evidence

Impressions tend to persist even after the evidence that created those impressions has been fully discredited. Psychologists have become interested in this phenomenon because many of their experiments require that the test subjects be deceived. For example, test subjects may be made to believe they were successful or unsuccessful in performing some task, or that they possess certain abilities or personality traits, when this is not in fact the case. Professional ethics require that test subjects be disabused of these false impressions at the end of the experiment, but this has proved surprisingly difficult to achieve.

Test subjects' erroneous impressions concerning their logical problem-solving abilities persevered even after they were informed that manipulation of good or poor teaching performance had virtually guaranteed their success or failure.[102] Similarly, test subjects asked to distinguish true from fictitious suicide notes were given feedback that had no relationship to actual performance. The test subjects had been randomly divided into two groups, with members of one group being given the impression of above-average success and the other of relative failure at this task. The subjects' erroneous impressions of the difficulty of the task

102. R. R. Lau, M. R. Lepper, and L. Ross, "Persistence of Inaccurate and Discredited Personal Impressions: A Field Demonstration of Attributional Perseverance," paper presented at 56th Annual Meeting of the Western Psychological Association (Los Angeles, April 1976).

and of their own performance persisted even after they were informed of the deception—that is, informed that their alleged performance had been preordained by their assignment to one or the other test group. Moreover, the same phenomenon was found among observers of the experiment as well as the immediate participants.[103]

There are several cognitive processes that might account for this phenomenon. The tendency to interpret new information in the context of pre-existing impressions is relevant but probably not sufficient to explain why the pre-existing impression cannot be eradicated even when new information authoritatively discredits the evidence on which it is based.

An interesting but speculative explanation is based on the strong tendency to seek causal explanations, as discussed in the next chapter. When evidence is first received, people postulate a set of causal connections that explains this evidence. In the experiment with suicide notes, for example, one test subject attributed her apparent success in distinguishing real from fictitious notes to her empathetic personality and the insights she gained from the writings of a novelist who committed suicide. Another ascribed her apparent failure to lack of familiarity with people who might contemplate suicide. The stronger the perceived causal linkage, the stronger the impression created by the evidence.

Even after learning that the feedback concerning their performance was invalid, these subjects retained this plausible basis for inferring that they were either well or poorly qualified for the task. The previously perceived causal explanation of their ability or lack of ability still came easily to mind, independently of the now-discredited evidence that first brought it to mind.[104] Colloquially, one might say that once information rings a bell, the bell cannot be unrung.

The ambiguity of most real-world situations contributes to the operation of this perseverance phenomenon. Rarely in the real world is evidence so thoroughly discredited as is possible in the experimental laboratory. Imagine, for example, that you are told that a clandestine source who has been providing information for some time is actually under hostile control. Imagine further that you have formed a number

103. Lee Ross, Mark R. Lepper, and Michael Hubbard, "Perseverance in Self-Perception and Social Perception: Biased Attributional Processes in the Debriefing Paradigm," *Journal of Personality and Social Psychology, 32*, 5, (1975), 880-892.
104. Lee Ross, Mark R. Lepper, Fritz Strack, and Julia Steinmetz, "Social Explanation and Social Expectation: Effects of Real and Hypothetical Explanations on Subjective Likelihood," *Journal of Personality and Social Psychology, 33*, 11 (1977), 818.

of impressions on the basis of reporting from this source. It is easy to rationalize maintaining these impressions by arguing that the information was true despite the source being under control, or by doubting the validity of the report claiming the source to be under control. In the latter case, the perseverance of the impression may itself affect evaluation of the evidence that supposedly discredits the impression.

Chapter 11

Biases in Perception of Cause and Effect

Judgments about cause and effect are necessary to explain the past, understand the present, and estimate the future. These judgments are often biased by factors over which people exercise little conscious control, and this can influence many types of judgments made by intelligence analysts. Because of a need to impose order on our environment, we seek and often believe we find causes for what are actually accidental or random phenomena. People overestimate the extent to which other countries are pursuing a coherent, coordinated, rational plan, and thus also overestimate their own ability to predict future events in those nations. People also tend to assume that causes are similar to their effects, in the sense that important or large effects must have large causes.

When inferring the causes of behavior, too much weight is accorded to personal qualities and dispositions of the actor and not enough to situational determinants of the actor's behavior. People also overestimate their own importance as both a cause and a target of the behavior of others. Finally, people often perceive relationships that do not in fact exist, because they do not have an intuitive understanding of the kinds and amount of information needed to prove a relationship.

* * * * * * * * * * * * * * * * * * * *

We cannot see cause and effect in the same sense that we see a desk or a tree. Even when we observe one billiard ball striking another and then watch the previously stationary ball begin to move, we are not perceiving cause and effect. The conclusion that one ball *caused* the other to move results only from a complex process of inference, not from direct sensory perception. That inference is based on the juxtaposition of events in time and space plus some theory or logical explanation as to why this happens.

There are several modes of analysis by which one might infer cause and effect. In more formal analysis, inferences are made through procedures that collectively comprise the scientific method. The scientist advances a hypothesis, then tests this hypothesis by the collection and statistical analysis of data on many instances of the phenomenon in question. Even then, causality cannot be proved beyond all possible doubt.

The scientist seeks to disprove a hypothesis, not to confirm it. A hypothesis is accepted only when it cannot be rejected.

Collection of data on many comparable cases to test hypotheses about cause and effect is not feasible for most questions of interest to the Intelligence Community, especially questions of broad political or strategic import relating to another country's intentions. To be sure, it is feasible more often than it is done, and increased use of scientific procedures in political, economic, and strategic research is much to be encouraged. But the fact remains that the dominant approach to intelligence analysis is necessarily quite different. It is the approach of the historian rather than the scientist, and this approach presents obstacles to accurate inferences about causality.

The procedures and criteria most historians use to attribute causality are less well defined than the scientist's.

> The historian's aim [is] to make a coherent whole out of the events he studies. His way of doing that, I suggest, is to look for certain dominant concepts or leading ideas by which to illuminate his facts, to trace the connections between those ideas themselves, and then to show how the detailed facts became intelligible in the light of them by constructing a "significant" narrative of the events of the period in question.[105]

The key ideas here are coherence and narrative. These are the principles that guide the organization of observations into meaningful structures and patterns. The historian commonly observes only a single case, not a pattern of covariation (when two things are related so that change in one is associated with change in the other) in many comparable cases. Moreover, the historian observes simultaneous changes in so many variables that the principle of covariation generally is not helpful in sorting out the complex relationships among them. The narrative story, on the other hand, offers a means of organizing the rich complexity of the historian's observations. The historian uses imagination to construct a coherent story out of fragments of data.

The intelligence analyst employing the historical mode of analysis is essentially a storyteller. He or she constructs a plot from the previous

105. W. H. Walsh, *Philosophy of History: An Introduction* (Revised Edition: New York: Harper and Row, 1967), p. 61.

events, and this plot then dictates the possible endings of the incomplete story. The plot is formed of the "dominant concepts or leading ideas" that the analyst uses to postulate patterns of relationships among the available data. The analyst is not, of course, preparing a work of fiction. There are constraints on the analyst's imagination, but imagination is nonetheless involved because there is an almost unlimited variety of ways in which the available data might be organized to tell a meaningful story. The constraints are the available evidence and the principle of coherence. The story must form a logical and coherent whole and be internally consistent as well as consistent with the available evidence.

Recognizing that the historical or narrative mode of analysis involves telling a coherent story helps explain the many disagreements among analysts, inasmuch as coherence is a subjective concept. It assumes some prior beliefs or mental model about what goes with what. More relevant to this discussion, the use of coherence rather than scientific observation as the criterion for judging truth leads to biases that presumably influence all analysts to some degree. Judgments of coherence may be influenced by many extraneous factors, and if analysts tend to favor certain types of explanations as more coherent than others, they will be biased in favor of those explanations.

Bias in Favor of Causal Explanations

One bias attributable to the search for coherence is a tendency to favor causal explanations. Coherence implies order, so people naturally arrange observations into regular patterns and relationships. If no pattern is apparent, our first thought is that we lack understanding, not that we are dealing with random phenomena that have no purpose or reason. As a last resort, many people attribute happenings that they cannot understand to God's will or to fate, which is somehow preordained; they resist the thought that outcomes may be determined by forces that interact in random, unpredictable ways. People generally do not accept the notion of chance or randomness. Even dice players behave as though they exert some control over the outcome of a throw of dice.[106] The prevalence of the word "because" in everyday language reflects the human tendency to seek to identify causes.

106. Ellen J. Langer, "The Psychology of Chance," *Journal for the Theory of Social Behavior,* 7 (1977), 185-208.

People expect patterned events to look patterned, and random events to look random, but this is not the case. Random events often look patterned. The random process of flipping a coin six times may result in six consecutive heads. Of the 32 possible sequences resulting from six coin flips, few actually look "random."[107] This is because randomness is a property of the process that generates the data that are produced. Randomness may in some cases be demonstrated by scientific (statistical) analysis. However, events will almost never be perceived intuitively as being random; one can find an apparent pattern in almost any set of data or create a coherent narrative from any set of events.

Because of a need to impose order on their environment, people seek and often believe they find causes for what are actually random phenomena. During World War II, Londoners advanced a variety of causal explanations for the pattern of German bombing. Such explanations frequently guided their decisions about where to live and when to take refuge in air raid shelters. Postwar examination, however, determined that the clustering of bomb hits was close to a random distribution.[108]

The Germans presumably intended a purposeful pattern, but purposes changed over time and they were not always achieved, so the net result was an almost random pattern of bomb hits. Londoners focused their attention on the few clusters of hits that supported their hypotheses concerning German intentions—not on the many cases that did not.

Some research in paleobiology seems to illustrate the same tendency. A group of paleobiologists has developed a computer program to simulate evolutionary changes in animal species over time. But the transitions from one time period to the next are not determined by natural selection or any other regular process: they are determined by computer-generated random numbers. The patterns produced by this program are similar to the patterns in nature that paleobiologists have been trying to understand. Hypothetical evolutionary events that seem, intuitively, to have a strong pattern were, in fact, generated by random processes.[109]

Yet another example of imposing causal explanations on random events is taken from a study dealing with the research practices of psy-

chologists. When experimental results deviated from expectations, these scientists rarely attributed the deviation to variance in the sample. They were always able to come up with a more persuasive causal explanation for the discrepancy.[110]

B. F. Skinner even noted a similar phenomenon in the course of experiments with the behavioral conditioning of pigeons. The normal pattern of these experiments was that the pigeons were given positive reinforcement, in the form of food, whenever they pecked on the proper lever at the proper time. To obtain the food regularly, they had to learn to peck in a certain sequence. Skinner demonstrated that the pigeons "learned" and followed a pattern (which Skinner termed a superstition) even when the food was actually dispensed randomly.[111]

These examples suggest that in military and foreign affairs, where the patterns are at best difficult to fathom, there may be many events for which there are no valid causal explanations. This certainly affects the predictability of events and suggests limitations on what might logically be expected of intelligence analysts.

Bias Favoring Perception of Centralized Direction

Very similar to the bias toward causal explanations is a tendency to see the actions of other governments (or groups of any type) as the intentional result of centralized direction and planning. ". . .most people are slow to perceive accidents, unintended consequences, coincidences, and small causes leading to large effects. Instead, coordinated actions, plans and conspiracies are seen."[112] Analysts overestimate the extent to which other countries are pursuing coherent, rational, goal-maximizing policies, because this makes for more coherent, logical, rational explanations. This bias also leads analysts and policymakers alike to overestimate the predictability of future events in other countries.

Analysts know that outcomes are often caused by accident, blunder, coincidence, the unintended consequence of well-intentioned policy, improperly executed orders, bargaining among semi-independent bu-

reaucratic entities, or following standard operating procedures under inappropriate circumstances.[113] But a focus on such causes implies a disorderly world in which outcomes are determined more by chance than purpose. It is especially difficult to incorporate these random and usually unpredictable elements into a coherent narrative, because evidence is seldom available to document them on a timely basis. It is only in historical perspective, after memoirs are written and government documents released, that the full story becomes available.

This bias has important consequences. Assuming that a foreign government's actions result from a logical and centrally directed plan leads an analyst to:

- Have expectations regarding that governmentÍs actions that may not be fulfilled if the behavior is actually the product of shifting or inconsistent values, bureaucratic bargaining, or sheer confusion and blunder.

- Draw far-reaching but possibly unwarranted inferences from isolated statements or actions by government officials who may be acting on their own rather than on central direction.

- Overestimate the United States' ability to influence the other government's actions.

- Perceive inconsistent policies as the result of duplicity and Machiavellian maneuvers, rather than as the product of weak leadership, vacillation, or bargaining among diverse bureaucratic or political interests.

Similarity of Cause and Effect

When systematic analysis of covariation is not feasible and several alternative causal explanations seem possible, one rule of thumb people use to make judgments of cause and effect is to consider the similarity between attributes of the cause and attributes of the effect. Properties of the cause are ". . .inferred on the basis of being correspondent with or

113. For many historical examples, see Jervis, ibid., p. 321-23.

similar to properties of the effect."[114] Heavy things make heavy noises; dainty things move daintily; large animals leave large tracks. When dealing with physical properties, such inferences are generally correct.

People tend, however, to reason in the same way under circumstances when this inference is not valid. Thus, analysts tend to assume that economic events have primarily economic causes, that big events have important consequences, and that little events cannot affect the course of history. Such correspondence between cause and effect makes a more logical and persuasive—a more coherent—narrative, but there is little basis for expecting such inferences to correspond to historical fact.

Fischer labels the assumption that a cause must somehow resemble its effect the "fallacy of identity,"[115] and he cites as an example the historiography of the Spanish Armada. Over a period of several centuries, historians have written of the important consequences of the English defeat of the Spanish Armada in 1588. After refuting each of these arguments, Fischer notes:

> In short, it appears that the defeat of the Armada, mighty and melodramatic as it was, may have been remarkably barren of result. Its defeat may have caused very little, except the disruption of the Spanish strategy that sent it on its way. That judgment is sure to violate the patriotic instincts of every Englishman and the aesthetic sensibilities of us all. A big event *must* have big results, we think.[116]

The tendency to reason according to similarity of cause and effect is frequently found in conjunction with the previously noted bias toward inferring centralized direction. Together, they explain the persuasiveness of conspiracy theories. Such theories are invoked to explain large effects for which there do not otherwise appear to be correspondingly large causes. For example, it seems ". . .outrageous that a single, pathetic, weak figure like Lee Harvey Oswald should alter world history."[117] Because the purported motive for the assassination of John Kennedy is so dissimilar

114. Harold H. Kelley, "The Processes of Causal Attribution," *American Psychologist* (February 1973), p. 121.

from the effect it is alleged to explain, in the minds of many it fails to meet the criterion of a coherent narrative explanation. If such "little" causes as mistakes, accidents, or the aberrant behavior of a single individual have big effects, then the implication follows that major events happen for reasons that are senseless and random rather than by purposeful direction.

Intelligence analysts are more exposed than most people to hard evidence of real plots, coups, and conspiracies in the international arena. Despite this—or perhaps because of it—most intelligence analysts are not especially prone to what are generally regarded as conspiracy theories. Although analysts may not exhibit this bias in such extreme form, the bias presumably does influence analytical judgments in myriad little ways. In examining causal relationships, analysts generally construct causal explanations that are somehow commensurate with the magnitude of their effects and that attribute events to human purposes or predictable forces rather than to human weakness, confusion, or unintended consequences.

Internal vs. External Causes of Behavior

Much research into how people assess the causes of behavior employs a basic dichotomy between internal determinants and external determinants of human actions. Internal causes of behavior include a person's attitudes, beliefs, and personality. External causes include incentives and constraints, role requirements, social pressures, or other forces over which the individual has little control. The research examines the circumstances under which people attribute behavior either to stable dispositions of the actor or to characteristics of the situation to which the actor responds.

Differences in judgments about what causes another person's or government's behavior affect how people respond to that behavior. How people respond to friendly or unfriendly actions by others may be quite different if they attribute the behavior to the nature of the person or government than if they see the behavior as resulting from situational constraints over which the person or government has little control.

A fundamental error made in judging the causes of behavior is to overestimate the role of internal factors and underestimate the role of external factors. When observing another's behavior, people are too in-

clined to infer that the behavior was caused by broad personal qualities or dispositions of the other person and to expect that these same inherent qualities will determine the actor's behavior under other circumstances. Not enough weight is assigned to external circumstances that may have influenced the other person's choice of behavior. This pervasive tendency has been demonstrated in many experiments under quite diverse circumstances[118] and has often been observed in diplomatic and military interactions.[119]

Susceptibility to this biased attribution of causality depends upon whether people are examining their own behavior or observing that of others. It is the behavior of others that people tend to attribute to the nature of the actor, whereas they see their own behavior as conditioned almost entirely by the situation in which they find themselves. This difference is explained largely by differences in information available to actors and observers. People know a lot more about themselves.

The actor has a detailed awareness of the history of his or her own actions under similar circumstances. In assessing the causes of our own behavior, we are likely to consider our previous behavior and focus on how it has been influenced by different situations. Thus situational variables become the basis for explaining our own behavior. This contrasts with the observer, who typically lacks this detailed knowledge of the other person's past behavior. The observer is inclined to focus on how the other person's behavior compares with the behavior of others under similar circumstances.[120] This difference in the type and amount of information available to actors and observers applies to governments as well as people.

An actor's personal involvement with the actions being observed enhances the likelihood of bias. "Where the observer is also an actor, he is likely to exaggerate the uniqueness and emphasize the dispositional origins of the responses of others to his own actions."[121] This is because the observer assumes his or her own actions are unprovocative, clearly

118. Lee Ross, "The Intuitive Psychologist and his Shortcomings: Distortions in the Attribution Process," in Leonard Berkowitz, ed., *Advances in Experimental Social Psychology*, Volume 10 (New York: Academic Press, 1977), p. 184.

understood by other actors, and well designed to elicit a desired response. Indeed, an observer interacting with another actor sees himself as determining the situation to which the other actor responds. When the actor does not respond as expected, the logical inference is that the response was caused by the nature of the actor rather than by the nature of the situation.

Intelligence analysts are familiar with the problem of weighing internal versus external causes of behavior in a number of contexts. When a new leader assumes control of a foreign government, analysts assess the likely impact of changed leadership on government policy. For example, will the former Defense Minister who becomes Prime Minister continue to push for increases in the defense budget? Analysts weigh the known predispositions of the new Prime Minister, based on performance in previous positions, against the requirements of the situation that constrain the available options. If relatively complete information is available on the situational constraints, analysts may make an accurate judgment on such questions. Lacking such information, they tend to err on the side of assuming that the individual's personal predispositions will prompt continuation of past behavior.

Consider the Soviet invasion of Afghanistan. The Soviets' perception of their own behavior was undoubtedly very different from the American perception. Causal attribution theory suggests that Soviet leaders would see the invasion as a reaction to the imperatives of the situation in South Asia at that time, such as the threat of Islamic nationalism spreading from Iran and Afghanistan into the Soviet Union. Further, they would perceive US failure to understand their "legitimate" national interests as caused by fundamental US hostility.[122]

122. See Richards J. Heuer, Jr., "Analyzing the Soviet Invasion of Afghanistan: Hypotheses from Causal Attribution Theory," *Studies in Comparative Communism*, Winter 1980. These comments concerning the Soviet invasion of Afghanistan are based solely on the results of psychological research, not on information concerning Soviet actions in Afghanistan or the US reaction thereto. The nature of generalizations concerning how people normally process information is that they apply "more or less" to many cases but may not offer a perfect fit to any single instance. There were obviously many other factors that influenced analysis of Soviet actions, including preconceptions concerning the driving forces behind Soviet policy. The intent is to illustrate the relevance of psychological research on the analytical process, not to debate the merits of alternative interpretations of Soviet policy. Thus I leave to the reader to judge how much his or her own interpretation of the Soviet invasion of Afghanistan may be influenced by these attributional tendencies.

Conversely, observers of the Soviet invasion would be inclined to attribute it to the aggressive and expansionist nature of the Soviet regime. Dislike of the Soviet Union and lack of information on the situational constraints as perceived by the Soviets themselves would be likely to exacerbate the attributional bias.[123] Further, to the extent that this bias stemmed from insufficient knowledge of situational pressures and constraints, one might expect policymakers who were not Soviet experts to have had a stronger bias than analysts specializing in the Soviet Union. With their greater base of information on the situational variables, the specialists may be better able to take these variables into account.

Specialists on occasion become so deeply immersed in the affairs of the country they are analyzing that they begin to assume the perspective—and the biases—of that country's leaders. During the Cold War, there was a persistent difference between CIA specialists in Soviet affairs and specialists in Chinese affairs when dealing with Sino-Soviet relations. During border clashes in 1969, for example, specialists on the USSR argued that the Chinese were being "provocative." These specialists tended to accept the Soviet regime's versions as to the history and alignment of the border. Specialists in Chinese affairs tended to take the opposite view—that is, that the arrogant Russians were behaving like Russians often do, while the Chinese were simply reacting to the Soviet high-handedness.[124] In other words, the analysts assumed the same biased perspective as the leaders of the country about which they were most knowledgeable. An objective account of causal relationships might have been somewhere between these two positions.

The Egypt-Israel peace negotiations in 1978–1979 offered another example of apparent bias in causal attribution. In the words of one observer at the time:

> Egyptians attribute their willingness to sign a treaty with Israel as due to their inherent disposition for peace; Israelis explain Egyptian willingness to make peace as resulting from a deteriorating economy and a growing awareness of Israel's military superiority. On the other hand, Israelis attribute their own orientation for accommodation as being due to their ever-present

123. Edward Jones and Richard Nisbett, "The Actor and the Observer: Divergent Perceptions of Their Behavior," in Edward Jones *et al., Attribution: Perceiving the Causes of Behavior* (New Jersey: General Learning Press, 1971), p. 93.
124. Based on personal discussion with CIA analysts.

> preference for peace. Egypt, however, explains Israel's compromises regarding, for example, Sinai, as resulting from external pressures such as positive inducements and threats of negative sanctions by the United States. In addition, some Egyptians attribute Israel's undesirable behavior, such as establishment of Jewish settlements on the West Bank of the Jordan River, as stemming from Zionist expansionism. If Israel should not place settlements in that territory, Egyptians might account for such desirable behavior as being due to external constraints, such as Western condemnation of settlements. Israelis, on the other hand explain undesirable behavior, such as Egypt's past tendency to issue threats to drive them into the sea, as resulting from Egypt's inherent opposition to a Jewish state in the Middle East. When Egyptians ceased to make such threats, Israelis attributed this desirable behavior as emanating from external circumstances, such as Israel's relative military superiority.[125]

The persistent tendency to attribute cause and effect in this manner is not simply the consequence of self-interest or propaganda by the opposing sides. Rather, it is the readily understandable and predictable result of how people normally attribute causality under many different circumstances.

As a general rule, biased attribution of causality helps sow the seeds of mistrust and misunderstanding between people and between governments. We tend to have quite different perceptions of the causes of each other's behavior.

Overestimating Our Own Importance

Individuals and governments tend to overestimate the extent to which they successfully influence the behavior of others.[126] This is an exception to the previously noted generalization that observers attribute the behavior of others to the nature of the actor. It occurs largely because a person is so familiar with his or her own efforts to influence another, but much less well informed about other factors that may have influenced the other's decision.

125. Raymond Tanter, "Bounded Rationality and Decision Aids," essay prepared for the Strategies of Conflict seminar, Mont Pelerin, Switzerland, 11-16 May 1980.
126. This section draws heavily upon Jervis, Chapter 9.

In estimating the influence of US policy on the actions of another government, analysts more often than not will be knowledgeable of US actions and what they are intended to achieve, but in many instances they will be less well informed concerning the internal processes, political pressures, policy conflicts, and other influences on the decision of the target government.

This bias may have played a role in the recent US failure to anticipate Indian nuclear weapons testing even though the new Indian Government was elected partly on promises it would add nuclear weapons to India's military arsenal. Most US intelligence analysts apparently discounted the promises as campaign rhetoric, believing that India would be dissuaded from joining the nuclear club by economic sanctions and diplomatic pressure. Analysts overestimated the ability of US policy to influence Indian decisions.

When another country's actions are consistent with US desires, the most obvious explanation, in the absence of strong evidence to the contrary, is that US policy effectively influenced the decision.[127] Conversely, when another country behaves in an undesired manner, this is normally attributed to factors beyond US control. People and governments seldom consider the possibility that their own actions have had unintended consequences. They assume that their intentions have been correctly perceived and that actions will have the desired effect unless frustrated by external causes.

Many surveys and laboratory experiments have shown that people generally perceive their own actions as the cause of their successes but not of their failures. When children or students or workers perform well, their parents, teachers, or supervisors take at least part of the credit; when they do poorly, their mentors seldom assume any blame. Successful candidates for Congress generally believe their own behavior contributed strongly to their victory, while unsuccessful candidates blame defeat on factors beyond their control.

Another example is the chest thumping that some Americans engaged in after the fall of the Soviet Union. According to some, the demise of the USSR was caused by strong US policies, such as increased defense expenditures and the Strategic Defense Initiative, which caused Soviet leaders to realize they could no longer compete with the United

127. It follows from the same reasoning that we may underestimate the consequences of our actions on nations that are not the *intended* target of our influence.

States. The US news media played this story for several weeks, interviewing many people—some experts, some not—on why the Soviet Union collapsed. Most serious students understood that there were many reasons for the Soviet collapse, the most important of which were internal problems caused by the nature of the Soviet system.

People and governments also tend to overestimate their own importance as the target of others' actions. They are sensitive to the impact that others' actions have on them, and they generally assume that people and governments intend to do what they do and intend it to have the effect that it has. They are much less aware of, and consequently tend to downgrade the importance of, other causes or results of the action.

In analyzing the reasons why others act the way they do, it is common to ask, "What goals are the person or government pursuing?" But goals are generally inferred from the effects of behavior, and the effects that are best known and often seem most important are the effects upon ourselves. Thus actions that hurt us are commonly interpreted as intentional expressions of hostility directed at ourselves. Of course, this will often be an accurate interpretation, but people sometimes fail to recognize that actions that seem directed at them are actually the unintended consequence of decisions made for other reasons.

Illusory Correlation

At the start of this chapter, covariation was cited as one basis for inferring causality. It was noted that covariation may either be observed intuitively or measured statistically. This section examines the extent to which the intuitive perception of covariation deviates from the statistical measurement of covariation.

Statistical measurement of covariation is known as correlation. Two events are correlated when the existence of one event implies the existence of the other. Variables are correlated when a change in one variable implies a similar degree of change in another. Correlation alone does not necessarily imply causation. For example, two events might co-occur because they have a common cause, rather than because one causes the other. But when two events or changes do co-occur, and the time sequence is such that one always follows the other, people often infer that the first caused the second. Thus, inaccurate perception of correlation leads to inaccurate perception of cause and effect.

Judgments about correlation are fundamental to all intelligence analysis. For example, assumptions that worsening economic conditions lead to increased political support for an opposition party, that domestic problems may lead to foreign adventurism, that military government leads to unraveling of democratic institutions, or that negotiations are more successful when conducted from a position of strength are all based on intuitive judgments of correlation between these variables. In many cases these assumptions are correct, but they are seldom tested by systematic observation and statistical analysis.

Much intelligence analysis is based on common-sense assumptions about how people and governments normally behave. The problem is that people possess a great facility for invoking contradictory "laws" of behavior to explain, predict, or justify different actions occurring under similar circumstances. "Haste makes waste" and "He who hesitates is lost" are examples of inconsistent explanations and admonitions. They make great sense when used alone and leave us looking foolish when presented together. "Appeasement invites aggression" and "agreement is based upon compromise" are similarly contradictory expressions.

When confronted with such apparent contradictions, the natural defense is that "it all depends on. . . ." Recognizing the need for such qualifying statements is one of the differences between subconscious information processing and systematic, self-conscious analysis. Knowledgeable analysis might be identified by the ability to fill in the qualification; careful analysis by the frequency with which one remembers to do so.[128]

Illusory correlation occurs when people perceive a relationship that does not in fact exist. In looking at a series of cases, it seems that people often focus on instances that support the existence of a relationship but ignore those cases that fail to support it. Several experiments have demonstrated that people do not have an intuitive understanding of what information is really needed to assess the relationship between two events or two variables. There appears to be nothing in people's intuitive understanding that corresponds with the statistical concept of correlation.

Nurses were tested on their ability to learn through experience to judge the relationship, or correlation, between a symptom and the di-

128. This paragraph draws heavily from the ideas and phraseology of Baruch Fischhoff, "For Those Condemned to Study the Past: Reflections on Historical Judgment," in R. A. Shweder and D. W. Fiske, eds., *New Directions for Methodology of Behavioral Science: Fallible Judgment in Behavioral Research* (San Francisco: Jossey-Bass, 1980).

agnosis of illness.[129] The nurses were each shown 100 cards; every card ostensibly represented one patient. The cards had a row of four letters at the top representing various symptoms and another row of four letters at the bottom representing diagnoses. The nurses were instructed to focus on just one letter (A) representing one symptom and one letter (F) representing one diagnosis, and then to judge whether the symptom A was related to the diagnosis F. In other words, on the basis of experience with these 100 "patients," does the presence of symptom A help to diagnose the presence of illness F? The experiment was run a number of times using different degrees of relationship between A and F.

Put yourself briefly in the position of a test subject. You have gone through the cards and noticed that on about 25 of them, or a quarter of the cases, the symptom and the disease, A and F, are both present. Would you say there is a relationship? Why? Is it appropriate to make a judgment solely on the basis of the frequency of cases which support the hypothesis of a relationship between A and F? What else do you need to know? Would it be helpful to have the number of cases in which the symptom (A) was present without the disease (F)? Let us say this was also true on 25 cards, so that out of the 100 cards, 50 had A and 25 of those cards with A also had F. In other words, the disease was present in half the cases in which the symptom was observed. Is this sufficient to establish a relationship, or is it also necessary to know the number of times the disease was present without the symptom?

Actually, to determine the existence of such a relationship, one needs information to fill all four cells of a 2 x 2 contingency table. Figure 16 shows such a table for one test run of this experiment. The table shows the number of cases of patients having each of four possible combinations of symptom and disease.

Eighteen of 19 test subjects given the 100 cards representing this particular combination of A and F thought there was at least a weak relationship, and several thought there was a strong relationship, when in fact, there is no correlation at all. More than half the test subjects based their judgment solely on the frequency of cases in which both A and F were present. This is the upper left cell of the table. These subjects were trying to determine if there was a relationship between A and F. When looking through the cards, 25 percent of the cases they looked at were

129. Jan Smedslund, "The Concept of Correlation in Adults," *Scandinavian Journal of Psychology*, Vol. 4 (1963), 165-73.

Figure 16

	A	Not A
F	25	25
Not F	25	25

consistent with the belief that symptom and diagnosis were perfectly correlated; this appears to be a lot of evidence to support the hypothesized relationship. Another smaller group of test subjects used somewhat more sophisticated reasoning. They looked at the total number of A cases and then asked in how many of these cases F was also present. This is the left side of the table in Figure 16. A third group resisted the basic concept of making a statistical generalization. When asked to describe their reasoning, they said that sometimes a relationship was present while in other cases it was not.

Of the 86 test subjects involved in several runnings of this experiment, not a single one showed any intuitive understanding of the concept of correlation. That is, no one understood that to make a proper judgment about the existence of a relationship, one must have information on all four cells of the table. Statistical correlation in its most elementary form is based on the ratio of the sums of the frequencies in the diagonal cells of a 2 x 2 table. In other words, a predominance of entries along either diagonal represents a strong statistical relationship between the two variables.

Let us now consider a similar question of correlation on a topic of interest to intelligence analysts. What are the characteristics of strategic deception and how can analysts detect it? In studying deception, one of the important questions is: what are the correlates of deception? Historically, when analysts study instances of deception, what else do they see that goes along with it, that is somehow related to deception, and that might be interpret as an indicator of deception? Are there certain practices relating to deception, or circumstances under which deception is most likely to occur, that permit one to say, that, because we have seen x or y or z, this most likely means a deception plan is under way? This would be comparable to a doctor observing certain symptoms and

concluding that a given disease may be present. This is essentially a problem of correlation. If one could identify several correlates of deception, this would significantly aid efforts to detect it.

The hypothesis has been advanced that deception is most likely when the stakes are exceptionally high.[130] If this hypothesis is correct, analysts should be especially alert for deception in such instances. One can cite prominent examples to support the hypothesis, such as Pearl Harbor, the Normandy landings, and the German invasion of the Soviet Union. It seems as though the hypothesis has considerable support, given that it is so easy to recall examples of high stakes situations in which deception was employed. But consider what it would take to prove, empirically, that such a relationship actually exists. Figure 17 sets up the problem as a 2 x 2 contingency table.

Figure 17

	High Stakes	Not High Stakes
Deception	68	?
No Deception	35	?

Barton Whaley researched 68 cases in which surprise or deception was present in strategic military operations between 1914 and 1968.[131] Let us assume that some form of deception, as well as surprise, was present in all 68 cases and put this number in the upper left cell of the table. How many cases are there with high stakes when deception was not used? That is a lot harder to think about and to find out about; researchers seldom devote much effort to documenting negative cases, when something did not occur. Fortunately, Whaley did make a rough estimate that both deception and surprise were absent in one-third to one-half of the cases of "grand strategy" during this period, which is the basis for putting the number 35 in the lower left cell of Figure 17.

130. Robert Axelrod, "The Rational Timing of Surprise," *World Politics*, XXXI (January 1979), pp. 228-246.
131. Barton Whaley, *Stratagem: Deception and Surprise in War*, (Cambridge, MA: Massachusetts Institute of Technology, unpublished manuscript, 1969), p. 247.

How common is deception when the stakes are not high? This is the upper right cell of Figure 17. Entries for this cell and the lower right cell are difficult to estimate; they require defining a universe of cases that includes low-stakes situations. What is a low-stakes situation in this context? High-stakes situations are definable, but there is an almost infinite number and variety of low-stakes situations. Because of this difficulty, it may not be feasible to use the full 2 x 2 table to analyze the relationship between deception and high stakes.

Perhaps it is necessary to be content with only the left side of the Figure 17 table. But then we cannot demonstrate empirically that one should be more alert to deception in high-stakes situations, because there is no basis for comparing high-stakes and low-stakes cases. If deception is even more common in tactical situations than it is in high stakes strategic situations, then analysts should not be more inclined to suspect deception when the stakes are high.

It is not really clear whether there is a relationship between deception and high-stakes situations, because there are not enough data. Intuitively, your gut feeling may tell you there is, and this feeling may well be correct. But you may have this feeling mainly because you are inclined to focus only on those cases in the upper left cell that do suggest such a relationship. People tend to overlook cases where the relationship does not exist, inasmuch as these are much less salient.

The lesson to be learned is not that analysts should do a statistical analysis of every relationship. They usually will not have the data, time, or interest for that. But analysts should have a general understanding of what it takes to know whether a relationship exists. This understanding is definitely not a part of people's intuitive knowledge. It does not come naturally. It has to be learned. When dealing with such issues, analysts have to force themselves to think about all four cells of the table and the data that would be required to fill each cell.

Even if analysts follow these admonitions, there are several factors that distort judgment when one does not follow rigorous scientific procedures in making and recording observations. These are factors that influence a person's ability to recall examples that fit into the four cells. For example, people remember occurrences more readily than non-occurrences. "History is, by and large, a record of what people did, not what they failed to do."[132]

132. E. H. Carr, *What is History?* (London: Macmillan, 1961), p. 126, cited by Fischhoff, *op. cit*.

Thus, instances in which deception occurred are easier to recall than instances in which it did not. Analysts remember occurrences that support the relationship they are examining better than those that do not. To the extent that perception is influenced by expectations, analysts may have missed or discounted the contrary instances. People also have a better memory for recent events, events in which they were personally involved, events that had important consequences, and so forth. These factors have a significant influence on perceptions of correlation when analysts make a gut judgment without consciously trying to think of all four cells of the table.

Many erroneous theories are perpetuated because they seem plausible and because people record their experience in a way that supports rather than refutes them. Ross describes this process as follows:

> . . .the intuitive observer selectively codes those data potentially relevant to the relationship between X and Y. Data points that fit his hypotheses and predictions are accepted as reliable, valid, representative, and free of error or "third-variable influences." Such data points are seen as reflective of the "real". . .relationship between X and Y. By contrast, data points that deviate markedly from the intuitive . . . expectations or theory are unlikely to be given great weight and tend to be dismissed as unreliable, erroneous, unrepresentative, or the product of contaminating third-variable influences. Thus the intuitive scientist who believes that fat men are jolly, or more specifically that fatness causes jolliness, will see particular fat and jolly men as strong evidence for this theory; he will not entertain the hypothesis that an individual's jollity is mere pretense or the product of a particularly happy home life rather than obesity. By contrast, fat and morose individuals will be examined very carefully before gaining admission to that scientist's store of relevant data. He might, for instance, seek to determine whether the individual's moroseness on the day in question is atypical, or the result of a nagging cold or a disappointing day, rather than the reflection of some stable attribute. It need hardly be emphasized that even a randomly generated [set of data] can yield a relatively high correlation if coded in the manner just outlined.[133]

Chapter 12

Biases in Estimating Probabilities

In making rough probability judgments, people commonly depend upon one of several simplified rules of thumb that greatly ease the burden of decision. Using the "availability" rule, people judge the probability of an event by the ease with which they can imagine relevant instances of similar events or the number of such events that they can easily remember. With the "anchoring" strategy, people pick some natural starting point for a first approximation and then adjust this figure based on the results of additional information or analysis. Typically, they do not adjust the initial judgment enough.

Expressions of probability, such as possible and probable, are a common source of ambiguity that make it easier for a reader to interpret a report as consistent with the reader's own preconceptions. The probability of a scenario is often miscalculated. Data on "prior probabilities" are commonly ignored unless they illuminate causal relationships.

* * * * * * * * * * * * * * * * * * * *

Availability Rule

One simplified rule of thumb commonly used in making probability estimates is known as the availability rule. In this context, "availability" refers to imaginability or retrievability from memory. Psychologists have shown that two cues people use unconsciously in judging the probability of an event are the ease with which they can imagine relevant instances of the event and the number or frequency of such events that they can easily remember.[134] People are using the availability rule of thumb whenever they estimate frequency or probability on the basis of how easily they can recall or imagine instances of whatever it is they are trying to estimate.

134. Amos Tversky and Daniel Kahneman, "Availability: A Heuristic for Judging Frequency and Probability," *Cognitive Psychology*, 5 (1973), pp. 207-232.

Normally this works quite well. If one thing actually occurs more frequently than another and is therefore more probable, we probably can recall more instances of it. Events that are likely to occur usually are easier to imagine than unlikely events. People are constantly making inferences based on these assumptions. For example, we estimate our chances for promotion by recalling instances of promotion among our colleagues in similar positions and with similar experience. We estimate the probability that a politician will lose an election by imagining ways in which he may lose popular support.

Although this often works well, people are frequently led astray when the ease with which things come to mind is influenced by factors unrelated to their probability. The ability to recall instances of an event is influenced by how recently the event occurred, whether we were personally involved, whether there were vivid and memorable details associated with the event, and how important it seemed at the time. These and other factors that influence judgment are unrelated to the true probability of an event.

Consider two people who are smokers. One had a father who died of lung cancer, whereas the other does not know anyone who ever had lung cancer. The one whose father died of lung cancer will normally perceive a greater probability of adverse health consequences associated with smoking, even though one more case of lung cancer is statistically insignificant when weighing such risk. How about two CIA officers, one of whom knew Aldrich Ames and the other who did not personally know anyone who had ever turned out to be a traitor? Which one is likely to perceive the greatest risk of insider betrayal?

It was difficult to imagine the breakup of the Soviet Union because such an event was so foreign to our experience of the previous 50 years. How difficult is it now to imagine a return to a Communist regime in Russia? Not so difficult, in part because we still have vivid memories of the old Soviet Union. But is that a sound basis for estimating the likelihood of its happening? When analysts make quick, gut judgments without really analyzing the situation, they are likely to be influenced by the availability bias. The more a prospective scenario accords with one's experience, the easier it is to imagine and the more likely it seems.

Intelligence analysts may be less influenced than others by the availability bias. Analysts are evaluating all available information, not making quick and easy inferences. On the other hand, policymakers and journal-

ists who lack the time or access to evidence to go into details must necessarily take shortcuts. The obvious shortcut is to use the availability rule of thumb for making inferences about probability.

Many events of concern to intelligence analysts

> . . .are perceived as so unique that past history does not seem relevant to the evaluation of their likelihood. In thinking of such events we often construct scenarios, i.e., stories that lead from the present situation to the target event. The plausibility of the scenarios that come to mind, or the difficulty of producing them, serve as clues to the likelihood of the event. If no reasonable scenario comes to mind, the event is deemed impossible or highly unlikely. If several scenarios come easily to mind, or if one scenario is particularly compelling, the event in question appears probable.[135]

US policymakers in the early years of our involvement in Vietnam had to imagine scenarios for what might happen if they did or did not commit US troops to the defense of South Vietnam. In judging the probability of alternative outcomes, our senior leaders were strongly influenced by the ready availability of two seemingly comparable scenarios—the failure of appeasement prior to World War II and the successful intervention in Korea.

Many extraneous factors influence the imaginability of scenarios for future events, just as they influence the retrievability of events from memory. Curiously, one of these is the act of analysis itself. The act of constructing a detailed scenario for a possible future event makes that event more readily imaginable and, therefore, increases its perceived probability. This is the experience of CIA analysts who have used various tradecraft tools that require, or are especially suited to, the analysis of unlikely but nonetheless possible and important hypotheses. (Such techniques were discussed in Chapter 6, "Keeping an Open Mind" and Chapter 8, "Analysis of Competing Hypotheses.") The analysis usually results in the "unlikely" scenario being taken a little more seriously. This phenomenon has also been demonstrated in psychological experiments.[136]

135. Ibid., p. 229.
136. John S. Carroll, "The Effect of Imagining an Event on Expectations for the Event: An Interpretation in Terms of the Availability Heuristic", *Journal of Experimental Social Psychology*, 14 (1978), pp. 88-96.

In sum, the availability rule of thumb is often used to make judgments about likelihood or frequency. People would be hard put to do otherwise, inasmuch as it is such a timesaver in the many instances when more detailed analysis is not warranted or not feasible. Intelligence analysts, however, need to be aware when they are taking shortcuts. They must know the strengths and weaknesses of these procedures, and be able to identify when they are most likely to be led astray. For intelligence analysts, recognition that they are employing the availability rule should raise a caution flag. Serious analysis of probability requires identification and assessment of the strength and interaction of the many variables that will determine the outcome of a situation.

Anchoring

Another strategy people seem to use intuitively and unconsciously to simplify the task of making judgments is called anchoring. Some natural starting point, perhaps from a previous analysis of the same subject or from some partial calculation, is used as a first approximation to the desired judgment. This starting point is then adjusted, based on the results of additional information or analysis. Typically, however, the starting point serves as an anchor or drag that reduces the amount of adjustment, so the final estimate remains closer to the starting point than it ought to be.

Anchoring can be demonstrated very simply in a classroom exercise by asking a group of students to estimate one or more known quantities, such as the percentage of member countries in the United Nations that are located in Africa. Give half the students a low-percentage number and half a high-percentage number. Ask them to start with this number as an estimated answer, then, as they think about the problem, to adjust this number until they get as close as possible to what they believe is the correct answer. When this was done in one experiment that used this question, those starting with an anchor of 10 percent produced adjusted estimates that averaged 25 percent. Those who started with an anchor of 65 percent produced adjusted estimates that averaged 45 percent.[137]

Because of insufficient adjustment, those who started out with an estimate that was too high ended with significantly higher estimates than

137. Amos Tversky and Daniel Kahneman, "Judgment under Uncertainty: Heuristics and Biases," *Science*, Vol. 185, Sept. 27, 1974, pp. 1124-1131.

those who began with an estimate that was too low. Even the totally arbitrary starting points acted as anchors, causing drag or inertia that inhibited fulladjustment of estimates.

Whenever analysts move into a new analytical area and take over responsibility for updating a series of judgments or estimates made by their predecessors, the previous judgments may have such an anchoring effect. Even when analysts make their own initial judgment, and then attempt to revise this judgment on the basis of new information or further analysis, there is much evidence to suggest that they usually do not change the judgment enough.

Anchoring provides a partial explanation of experiments showing that analysts tend to be overly sure of themselves in setting confidence ranges. A military analyst who estimates future missile or tank production is often unable to give a specific figure as a point estimate. The analyst may, therefore, set a range from high to low, and estimate that there is, say, a 75-percent chance that the actual production figure will fall within this range. If a number of such estimates are made that reflect an appropriate degree of confidence, the true figure should fall within the estimated range 75 percent of the time and outside this range 25 percent of the time. In experimental situations, however, most participants are overconfident. The true figure falls outside the estimated range a much larger percentage of the time.[138]

If the estimated range is based on relatively hard information concerning the upper and lower limits, the estimate is likely to be accurate. If, however, the range is determined by starting with a single best estimate that is simply adjusted up and down to arrive at estimated maximum and minimum values, then anchoring comes into play, and the adjustment is likely to be insufficient.

Reasons for the anchoring phenomenon are not well understood. The initial estimate serves as a hook on which people hang their first impressions or the results of earlier calculations. In recalculating, they take this as a starting point rather than starting over from scratch, but why this should limit the range of subsequent reasoning is not clear.

138. Experiments using a 98-percent confidence range found that the true value fell outside the estimated range 40 to 50 percent of the time. Amos Tversky and Daniel Kahneman, "Anchoring and Calibration in the Assessment of Uncertain Quantities," (Oregon Research Institute Research Bulletin, 1972, Nov. 12, No. 5), and M. Alpert and H. Raiffa, "A Progress Report on The Training of Probability Assessors," Unpublished manuscript, Harvard University, 1968.

There is some evidence that awareness of the anchoring problem is not an adequate antidote.[139] This is a common finding in experiments dealing with cognitive biases. The biases persist even after test subjects are informed of them and instructed to try to avoid them or compensate for them.

One technique for avoiding the anchoring bias, to weigh anchor so to speak, may be to ignore one's own or others' earlier judgments and rethink a problem from scratch. In other words, consciously avoid any prior judgment as a starting point. There is no experimental evidence to show that this is possible or that it will work, but it seems worth trying. Alternatively, it is sometimes possible to avoid human error by employing formal statistical procedures. Bayesian statistical analysis, for example, can be used to revise prior judgments on the basis of new information in a way that avoids anchoring bias.[140]

Expression of Uncertainty

Probabilities may be expressed in two ways. Statistical probabilities are based on empirical evidence concerning relative frequencies. Most intelligence judgments deal with one-of-a-kind situations for which it is impossible to assign a statistical probability. Another approach commonly used in intelligence analysis is to make a "subjective probability" or "personal probability" judgment. Such a judgment is an expression of the analyst's personal belief that a certain explanation or estimate is correct. It is comparable to a judgment that a horse has a three-to-one chance of winning a race.

Verbal expressions of uncertainty—such as "possible," "probable," "unlikely," "may," and "could"—are a form of subjective probability judgment, but they have long been recognized as sources of ambiguity and misunderstanding. To say that something could happen or is possible

140. Nicholas Schweitzer, "Bayesian Analysis: Estimating the Probability of Middle East Conflict," in Richards J. Heuer, Jr., ed., *Quantitative Approaches to Political Intelligence: The CIA Experience* (Boulder, CO: Westview Press, 1979). Jack Zlotnick, "Bayes' Theorem for Intelligence Analysis," *Studies in Intelligence*, Vol. 16, No. 2 (Spring 1972). Charles E. Fisk, "The Sino-Soviet Border Dispute: A Comparison of the Conventional and Bayesian Methods for Intelligence Warning", *Studies in Intelligence*, vol. 16, no. 2 (Spring 1972), originally classified Secret, now declassified. Both the Zlotnick and Fisk articles were republished in H. Bradford Westerfield, *Inside CIA's Private World: Declassified Articles from the Agency's Internal Journal, 1955-1992*, (New Haven: Yale University Press, 1995).

may refer to anything from a 1-percent to a 99-percent probability. To express themselves clearly, analysts must learn to routinely communicate uncertainty using the language of numerical probability or odds ratios.

As explained in Chapter 2 on "Perception," people tend to see what they expect to see, and new information is typically assimilated to existing beliefs. This is especially true when dealing with verbal expressions of uncertainty. By themselves, these expressions have no clear meaning. They are empty shells. The reader or listener fills them with meaning through the context in which they are used and what is already in the reader's or listener's mind about that context.

When intelligence conclusions are couched in ambiguous terms, a reader's interpretation of the conclusions will be biased in favor of consistency with what the reader already believes. This may be one reason why many intelligence consumers say they do not learn much from intelligence reports.[141]

It is easy to demonstrate this phenomenon in training courses for analysts. Give students a short intelligence report, have them underline all expressions of uncertainty, then have them express their understanding of the report by writing above each expression of uncertainty the numerical probability they believe was intended by the writer of the report. This is an excellent learning experience, as the differences among students in how they understand the report are typically so great as to be quite memorable.

In one experiment, an intelligence analyst was asked to substitute numerical probability estimates for the verbal qualifiers in one of his own earlier articles. The first statement was: "The cease-fire is holding but could be broken within a week." The analyst said he meant there was about a 30-percent chance the cease-fire would be broken within a week. Another analyst who had helped this analyst prepare the article said she thought there was about an 80-percent chance that the cease-fire would be broken. Yet, when working together on the report, both analysts had believed they were in agreement about what could happen.[142] Obviously, the analysts had not even communicated effectively with each other, let alone with the readers of their report.

141. For another interpretation of this phenomenon, see Chapter 13, "Hindsight Biases in Evaluation of Intelligence Reporting."
142. Scott Barclay et al, *Handbook for Decision Analysis*. (McLean, VA: Decisions and Designs, Inc. 1977), p. 66.

Sherman Kent, the first director of CIA's Office of National Estimates, was one of the first to recognize problems of communication caused by imprecise statements of uncertainty. Unfortunately, several decades after Kent was first jolted by how policymakers interpreted the term "serious possibility" in a national estimate, this miscommunication between analysts and policymakers, and between analysts, is still a common occurrence.[143]

I personally recall an ongoing debate with a colleague over the bona fides of a very important source. I argued he was probably bona fide. My colleague contended that the source was probably under hostile control. After several months of periodic disagreement, I finally asked my colleague to put a number on it. He said there was at least a 51-percent chance of the source being under hostile control. I said there was at least a 51-percent chance of his being bona fide. Obviously, we agreed that there was a great deal of uncertainty. That stopped our disagreement. The problem was not a major difference of opinion, but the ambiguity of the term probable.

The table in Figure 18 shows the results of an experiment with 23 NATO military officers accustomed to reading intelligence reports. They were given a number of sentences such as: "It is highly unlikely that. . . ." All the sentences were the same except that the verbal expressions of probability changed. The officers were asked what percentage probability they would attribute to each statement if they read it in an intelligence report. Each dot in the table represents one officer's probability assignment.[144] While there was broad consensus about the meaning of "better than even," there was a wide disparity in interpretation of other probability expressions. The shaded areas in the table show the ranges proposed by Kent.[145]

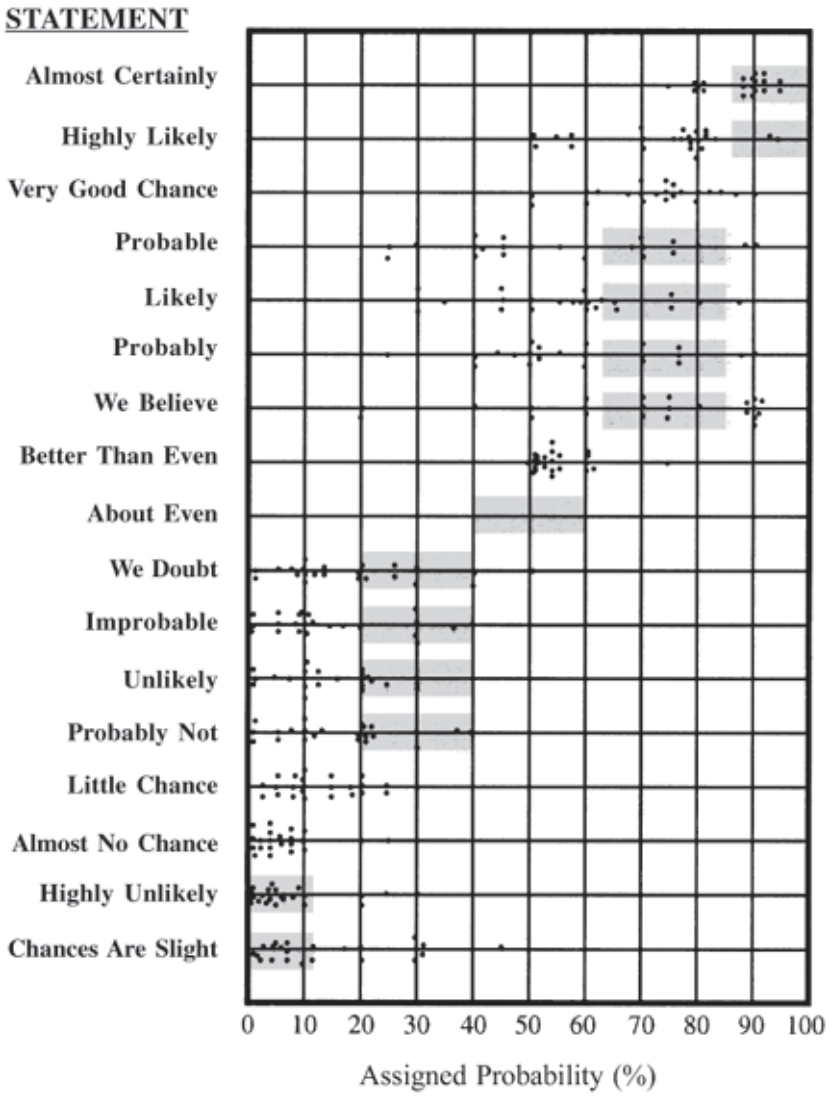
The main point is that an intelligence report may have no impact on the reader if it is couched in such ambiguous language that the reader can easily interpret it as consistent with his or her own preconceptions. This

143. Sherman Kent, "Words of Estimated Probability," in Donald P. Steury, ed., *Sherman Kent and the Board of National Estimates: Collected Essays* (CIA, Center for the Study of Intelligence, 1994).

144. Scott Barclay et al, p. 76-68.

145. Probability ranges attributed to Kent in this table are slightly different from those in Sherman Kent, "Words of Estimated Probability," in Donald P. Steury, ed., *Sherman Kent and the Board of National Estimates: Collected Essays* (CIA, Center for the Study of Intelligence, 1994).

Figure 18: Measuring Perceptions of Uncertainty



ambiguity can be especially troubling when dealing with low-probability, high-impact dangers against which policymakers may wish to make contingency plans.

Consider, for example, a report that there is little chance of a terrorist attack against the American Embassy in Cairo at this time. If the Ambassador's preconception is that there is no more than a one-in-a-hundred chance, he may elect to not do very much. If the Ambassador's preconception is that there may be as much as a one-in-four chance of an attack, he may decide to do quite a bit. The term "little chance" is consistent with either of those interpretations, and there is no way to know what the report writer meant.

Another potential ambiguity is the phrase "at this time." Shortening the time frame for prediction lowers the probability, but may not decrease the need for preventive measures or contingency planning. An event for which the timing is unpredictable may "at this time" have only a 5-percent probability of occurring during the coming month, but a 60-percent probability if the time frame is extended to one year (5 percent per month for 12 months).

How can analysts express uncertainty without being unclear about how certain they are? Putting a numerical qualifier in parentheses after the phrase expressing degree of uncertainty is an appropriate means of avoiding misinterpretation. This may be an odds ratio (less than a one-in-four chance) or a percentage range (5 to 20 percent) or (less than 20 percent). Odds ratios are often preferable, as most people have a better intuitive understanding of odds than of percentages.

Assessing Probability of a Scenario

Intelligence analysts sometimes present judgments in the form of a scenario—a series of events leading to an anticipated outcome. There is evidence that judgments concerning the probability of a scenario are influenced by amount and nature of detail in the scenario in a way that is unrelated to actual likelihood of the scenario.

A scenario consists of several events linked together in a narrative description. To calculate mathematically the probability of a scenario, the proper procedure is to multiply the probabilities of each individual event. Thus, for a scenario with three events, each of which will probably (70 percent certainty) occur, the probability of the scenario is .70 x .70

x .70 or slightly over 34 percent. Adding a fourth probable (70 percent) event to the scenario would reduce its probability to 24 percent.

Most people do not have a good intuitive grasp of probabilistic reasoning. One approach to simplifying such problems is to assume (or think as though) one or more probable events have already occurred. This eliminates some of the uncertainty from the judgment. Another way to simplify the problem is to base judgment on a rough average of the probabilities of each event. In the above example, the averaging procedure gives an estimated probability of 70 percent for the entire scenario. Thus, the scenario appears far more likely than is in fact the case.

When the averaging strategy is employed, highly probable events in the scenario tend to offset less probable events. This violates the principle that a chain cannot be stronger than its weakest link. Mathematically, the least probable event in a scenario sets the upper limit on the probability of the scenario as a whole. If the averaging strategy is employed, additional details may be added to the scenario that are so plausible they increase the perceived probability of the scenario, while, mathematically, additional events must necessarily reduce its probability.[146]

Base-Rate Fallacy

In assessing a situation, an analyst sometimes has two kinds of evidence available—specific evidence about the individual case at hand, and numerical data that summarize information about many similar cases. This type of numerical information is called a base rate or prior probability. The base-rate fallacy is that the numerical data are commonly ignored unless they illuminate a causal relationship. This is illustrated by the following experiment.[147]

During the Vietnam War, a fighter plane made a non-fatal strafing attack on a US aerial reconnaissance mission at twilight. Both Cambodian and Vietnamese jets operate in the area. You know the following facts:

(a) Specific case information: The US pilot identified the fighter as Cambodian. The pilot's aircraft recognition capabilities were tested under appropriate visibility and flight conditions. When presented

146. Paul Slovic, Baruch Fischhoff, and Sarah Lichtenstein, "Cognitive Processes and Societal Risk Taking," in J. S. Carroll and J.W. Payne, eds., *Cognition and Social Behavior* (Potomac, MD: Lawrence Erlbaum Associates, 1976), pp. 177-78.

147. This is a modified version, developed by Frank J. Stech, of the blue and green taxicab question used by Kahneman and Tversky, "On Prediction and Judgment," Oregon Research Institute Research Bulletin, 12, 14, 1972.

with a sample of fighters (half with Vietnamese markings and half with Cambodian) the pilot made correct identifications 80 percent of the time and erred 20 percent of the time.

(b) Base rate data: 85 percent of the jet fighters in that area are Vietnamese; 15 percent are Cambodian.

Question: What is the probability that the fighter was Cambodian rather than Vietnamese?

A common procedure in answering this question is to reason as follows: We know the pilot identified the aircraft as Cambodian. We also know the pilot's identifications are correct 80 percent of the time; therefore, there is an 80 percent probability the fighter was Cambodian. This reasoning appears plausible but is incorrect. It ignores the base rate—that 85 percent of the fighters in that area are Vietnamese. The base rate, or prior probability, is what you can say about any hostile fighter in that area before you learn anything about the specific sighting.

It is actually more likely that the plane was Vietnamese than Cambodian despite the pilot's "probably correct" identification. Readers who are unfamiliar with probabilistic reasoning and do not grasp this point should imagine 100 cases in which the pilot has a similar encounter. Based on paragraph (a), we know that 80 percent or 68 of the 85 Vietnamese aircraft will be correctly identified as Vietnamese, while 20 percent or 17 will be incorrectly identified as Cambodian. Based on paragraph (b), we know that 85 of these encounters will be with Vietnamese aircraft, 15 with Cambodian.

Similarly, 80 percent or 12 of the 15 Cambodian aircraft will be correctly identified as Cambodian, while 20 percent or three will be incorrectly identified as Vietnamese. This makes a total of 71 Vietnamese and 29 Cambodian sightings, of which only 12 of the 29 Cambodian sightings are correct; the other 17 are incorrect sightings of Vietnamese aircraft. Therefore, when the pilot claims the attack was by a Cambodian fighter, the probability that the craft was actually Cambodian is only 12/29ths or 41 percent, despite the fact that the pilot's identifications are correct 80 percent of the time.

This may seem like a mathematical trick, but it is not. The difference stems from the strong prior probability of the pilot observing a Vietnamese aircraft. The difficulty in understanding this arises because untrained intuitive judgment does not incorporate some of the basic statistical principles of probabilistic reasoning. Most people do not incor-

porate the prior probability into their reasoning because it does not seem relevant. It does not seem relevant because there is no causal relationship between the background information on the percentages of jet fighters in the area and the pilot's observation.[148] The fact that 85 percent of the fighters in the area were Vietnamese and 15 percent Cambodian did not *cause* the attack to be made by a Cambodian rather than a Vietnamese.

To appreciate the different impact made by causally relevant background information, consider this alternative formulation of the same problem. In paragraph (b) of the problem, substitute the following:

(b) Although the fighter forces of the two countries are roughly equal in number in this area, 85 percent of all harassment incidents involve Vietnamese fighters, while 15 percent involve Cambodian fighters.

The problem remains mathematically and structurally the same. Experiments with many test subjects, however, show it is quite different psychologically because it readily elicits a causal explanation relating the prior probabilities to the pilot's observation. If the Vietnamese have a propensity to harass and the Cambodians do not, the prior probability that Vietnamese harassment is more likely than Cambodian is no longer ignored. Linking the prior probability to a cause and effect relationship immediately raises the possibility that the pilot's observation was in error.

With this revised formulation of the problem, most people are likely to reason as follows: We know from past experience in cases such as this that the harassment is usually done by Vietnamese aircraft. Yet, we have a fairly reliable report from our pilot that it was a Cambodian fighter. These two conflicting pieces of evidence cancel each other out. Therefore, we do not know—it is roughly 50-50 whether it was Cambodian or Vietnamese. In employing this reasoning, we use the prior probability information, integrate it with the case-specific information, and arrive at a conclusion that is about as close to the optimal answer (still 41 percent) as one is going to get without doing a mathematical calculation.

There are, of course, few problems in which base rates are given as explicitly as in the Vietnamese/Cambodian aircraft example. When base

148. Maya Bar-Hillel, "The Base-Rate Fallacy in Probability Judgments," *Acta Psychologica*, 1980.

rates are not well known but must be inferred or researched, they are even less likely to be used.[149]

The so-called planning fallacy, to which I personally plead guilty, is an example of a problem in which base rates are not given in numerical terms but must be abstracted from experience. In planning a research project, I may estimate being able to complete it in four weeks. This estimate is based on relevant case-specific evidence: desired length of report, availability of source materials, difficulty of the subject matter, allowance for both predictable and unforeseeable interruptions, and so on. I also possess a body of experience with similar estimates I have made in the past. Like many others, I almost never complete a research project within the initially estimated time frame! But I am seduced by the immediacy and persuasiveness of the case-specific evidence. All the causally relevant evidence about the project indicates I should be able to complete the work in the time allotted for it. Even though I know from experience that this never happens, I do not learn from this experience. I continue to ignore the non-causal, probabilistic evidence based on many similar projects in the past, and to estimate completion dates that I hardly ever meet. (Preparation of this book took twice as long as I had anticipated. These biases are, indeed, difficult to avoid!)

149. Many examples from everyday life are cited in Robyn M. Dawes, *Rational Choice in an Uncertain World* (Harcourt Brace Jovanovich College Publishers, 1988), Chapter 5.

Chapter 13

Hindsight Biases in Evaluation of Intelligence Reporting

Evaluations of intelligence analysis—analysts' own evaluations of their judgments as well as others' evaluations of intelligence products—are distorted by systematic biases. As a result, analysts overestimate the quality of their analytical performance, and others underestimate the value and quality of their efforts. These biases are not simply the product of self-interest and lack of objectivity. They stem from the nature of human mental processes and are difficult and perhaps impossible to overcome.[150]

* * * * * * * * * * * * * * * * * * * *

Hindsight biases influence the evaluation of intelligence reporting in three ways:

- Analysts normally overestimate the accuracy of their past judgments.
- Intelligence consumers normally underestimate how much they learned from intelligence reports.
- Overseers of intelligence production who conduct postmortem analyses of an intelligence failure normally judge that events were more readily foreseeable than was in fact the case.

None of the biases is surprising. Analysts have observed these tendencies in others, although probably not in themselves. What may be

150. This chapter was first published as an unclassified article in *Studies in Intelligence*, Vol. 22, No. 2 (Summer 1978), under the title "Cognitive Biases: Problems in Hindsight Analysis." It was later published in H. Bradford Westerfield, editor, *Inside CIA's Private World: Declassified Articles from the Agency's Internal Journal, 1955-1992* (New Haven: Yale University Press, 1995.)

unexpected is that these biases are not only the product of self-interest and lack of objectivity. They are examples of a broader phenomenon that is built into human mental processes and that cannot be overcome by the simple admonition to be more objective.

Psychologists who conducted the experiments described below tried to teach test subjects to overcome these biases. Experimental subjects with no vested interest in the results were briefed on the biases and encouraged to avoid them or compensate for them, but could not do so. Like optical illusions, cognitive biases remain compelling even after we become aware of them.

The analyst, consumer, and overseer evaluating analytical performance all have one thing in common. They are exercising hindsight. They take their current state of knowledge and compare it with what they or others did or could or should have known before the current knowledge was received. This is in sharp contrast with intelligence estimation, which is an exercise in foresight, and it is the difference between these two modes of thought—hindsight and foresight—that seems to be a source of bias.

The amount of good information that is available obviously is greater in hindsight than in foresight. There are several possible explanations of how this affects mental processes. One is that the additional information available for hindsight changes perceptions of a situation so naturally and so immediately that people are largely unaware of the change. When new information is received, it is immediately and unconsciously assimilated into our pre-existing knowledge. If this new information adds significantly to our knowledge—that is, if it tells the outcome of a situation or the answer to a question about which we were previously uncertain—our mental images are restructured to take the new information into account. With the benefit of hindsight, for example, factors previously considered relevant may become irrelevant, and factors previously thought to have little relevance may be seen as determinative.

After a view has been restructured to assimilate the new information, there is virtually no way to accurately reconstruct the pre-existing mental set. Once the bell has rung, it cannot be unrung. A person may *remember* his or her previous judgments if not much time has elapsed and the judgments were precisely articulated, but apparently people cannot accurately *reconstruct* their previous thinking. The effort to reconstruct what we previously thought about a given situation, or what we would

have thought about it, is inevitably influenced by our current thought patterns. Knowing the outcome of a situation makes it harder to imagine other outcomes that might have been considered. Unfortunately, simply understanding that the mind works in this fashion does little to help overcome the limitation.

The overall message to be learned from an understanding of these biases, as shown in the experiments described below, is that an analyst's intelligence judgments are not as good as analysts think they are, or as bad as others seem to believe. Because the biases generally cannot be overcome, they would appear to be facts of life that analysts need to take into account in evaluating their own performance and in determining what evaluations to expect from others. This suggests the need for a more systematic effort to:

- Define what should be expected from intelligence analysts.
- Develop an institutionalized procedure for comparing intelligence judgments and estimates with actual outcomes.
- Measure how well analysts live up to the defined expectations.

The discussion now turns to the experimental evidence demonstrating these biases from the perspective of the analyst, consumer, and overseer of intelligence.

The Analyst's Perspective

Analysts interested in improving their own performance need to evaluate their past estimates in the light of subsequent developments. To do this, analysts must either remember (or be able to refer to) their past estimates or must reconstruct their past estimates on the basis of what they remember having known about the situation at the time the estimates were made. The effectiveness of the evaluation process, and of the learning process to which it gives impetus, depends in part upon the accuracy of these remembered or reconstructed estimates.

Experimental evidence suggests a systematic tendency toward faulty memory of past estimates.[151] That is, when events occur, people tend to overestimate the extent to which they had previously expected them to occur. And conversely, when events do not occur, people tend to underestimate the probability they had previously assigned to their occurrence. In short, events generally seem less surprising than they should on the basis of past estimates. This experimental evidence accords with analysts' intuitive experience. Analysts rarely appear—or allow themselves to appear—very surprised by the course of events they are following.

In experiments to test the bias in memory of past estimates, 119 subjects were asked to estimate the probability that a number of events would or would not occur during President Nixon's trips to Peking and Moscow in 1972. Fifteen possible outcomes were identified for each trip, and each subject assigned a probability to each of these outcomes. The outcomes were selected to cover the range of possible developments and to elicit a wide range of probability values.

At varying time periods after the trips, the same subjects were asked to remember or reconstruct their own predictions as accurately as possible. (No mention was made of the memory task at the time of the original prediction.) Then the subjects were asked to indicate whether they thought each event had or had not occurred during these trips.

When three to six months were allowed to elapse between the subjects' estimates and their recollection of these estimates, 84 percent of the subjects exhibited the bias when dealing with events they believed actually did happen. That is, the probabilities they remembered having estimated were higher than their actual estimates of events they believed actually did occur. Similarly, for events they believed did not occur, the probabilities they remembered having estimated were lower than their actual estimates, although here the bias was not as great. For both kinds of events, the bias was more pronounced after three to six months had elapsed than when subjects were asked to recall estimates they had given only two weeks earlier.

In summary, knowledge of the outcomes somehow affected most test subjects' memory of their previous estimates of these outcomes, and the more time that was allowed for memories to fade, the greater the

151. This section is based on research reported by Baruch Fischoff and Ruth Beyth in "I Knew It Would Happen: Remembered Probabilities of Once-Future Things," *Organizational Behavior and Human Performance*, 13 (1975), pp. 1-16.

effect of the bias. The developments during the President's trips were perceived as less surprising than they would have been if actual estimates were compared with actual outcomes. For the 84 percent of subjects who showed the anticipated bias, their retrospective evaluation of their estimative performance was clearly more favorable than warranted by the facts.

The Consumer's Perspective

When consumers of intelligence reports evaluate the quality of the intelligence product, they ask themselves the question: "How much did I learn from these reports that I did not already know?" In answering this question, there is a consistent tendency for most people to underestimate the contribution made by new information. This "I knew it all along" bias causes consumers to undervalue the intelligence product.[152]

That people do in fact commonly react to new information in this manner was tested in a series of experiments involving some 320 people, each of whom answered the same set of 75 factual questions taken from almanacs and encyclopedias. As a measure of their confidence in their answers, the subjects assigned to each question a number ranging from 50 percent to 100 percent, indicating their estimate of the probability that they had chosen the correct answer.

As a second step in the experiment, subjects were divided into three groups. The first group was given 25 of the previously asked questions and instructed to respond to them exactly as they had previously. This simply tested the subjects' ability to remember their previous answers. The second group was given the same set of 25 questions but with the correct answers circled "for your [the subjects'] general information." They, too, were asked to respond by reproducing their previous answers. This tested the extent to which learning the correct answers distorted the subjects' memories of their own previous answers, thus measuring the same bias in recollection of previous estimates that was discussed above from the analyst's perspective.

The third group was given a different set of 25 questions they had not previously seen, but which were of similar difficulty so that results

152. Experiments described in this section are reported in Baruch Fischhoff, *The Perceived Informativeness of Factual Information*, Technical Report DDI- I (Eugene, OR: Oregon Research Institute, 1976).

would be comparable with the other two groups. The correct answers were marked on the questionnaire, and the subjects were asked to respond to the questions as they would have responded had they not been told the answer. This tested their ability to recall accurately how much they had known before they learned the correct answer. The situation is comparable to that of intelligence consumers who are asked to evaluate how much they learned from a report, and who can do this only by trying to recollect the extent of their knowledge before they read the report.

The most significant results came from this third group of subjects. The group clearly overestimated what they had known originally and underestimated how much they learned from having been told the answer. For 19 of 25 items in one running of the experiment and 20 of 25 items in another running, this group assigned higher probabilities to the correct alternatives than it is reasonable to expect they would have assigned had they not already known the correct answers.

In summary, the experiment confirmed the results of the previous experiment showing that people exposed to an answer tend to remember having known more than they actually did. It also demonstrates that people have an even greater tendency to exaggerate the likelihood that they would have known the correct answer if they had not been informed of it. In other words, people tend to underestimate both how much they learn from new information and the extent to which new information permits them to make correct judgments with greater confidence. To the extent that intelligence consumers manifest these same biases, they will tend to underrate the value to them of intelligence reporting.

The Overseer's Perspective

An overseer, as the term is used here, is one who investigates intelligence performance by conducting apostmortemexamination of a high-profile intelligence failure. Such investigations are carried out by Congress, the Intelligence Community staff, and CIA or DI management. For those outside the executive branch who do not regularly read the intelligence product, this sort of retrospective evaluation of known intelligence failures is a principal basis for judgments about the quality of intelligence analysis.

A fundamental question posed in anypostmorteminvestigation of intelligence failure is this: Given the information that was available at the

time, should analysts have been able to foresee what was going to happen? Unbiased evaluation of intelligence performance depends upon the ability to provide an unbiased answer to this question.[153]

Unfortunately, once an event has occurred, it is impossible to erase from our mind the knowledge of that event and reconstruct what our thought processes would have been at an earlier point in time. In reconstructing the past, there is a tendency toward determinism, toward thinking that what occurred was inevitable under the circumstances and therefore predictable. In short, there is a tendency to believe analysts should have foreseen events that were, in fact, unforeseeable on the basis of the information available at the time.

The experiments reported in the following paragraphs tested the hypotheses that knowledge of an outcome increases the perceived inevitability of that outcome, and that people who are informed of the outcome are largely unaware that this information has changed their perceptions in this manner.

A series of sub-experiments used brief (150-word) summaries of several events for which four possible outcomes were identified. One of these events was the struggle between the British and the Gurkhas in India in 1814. The four possible outcomes for this event were 1) British victory, 2) Gurkha victory, 3) military stalemate with no peace settlement, and 4) military stalemate with a peace settlement. Five groups of 20 subjects each participated in each sub-experiment. One group received the 150-word description of the struggle between the British and the Gurkhas with no indication of the outcome. The other four groups received the identical description but with one sentence added to indicate the outcome of the struggle—a different outcome for each group.

The subjects in all five groups were asked to estimate the likelihood of each of the four possible outcomes and to evaluate the relevance to their judgment of each datum in the event description. Those subjects who were informed of an outcome were placed in the same position as an overseer of intelligence analysis preparing a postmortem analysis of an intelligence failure. This person tries to assess the probability of an outcome

153. Experiments described in this section are reported in Baruch Fischhoff, "Hindsight does not equal Foresight: The Effect of Outcome Knowledge on Judgment Under Uncertainty," *Journal of Experimental Psychology: Human Perception and Performance*, 1, 3 (1975), pp. 288-299.

Figure 19

Experimental Groups	Average Probabilities Assigned to Outcomes			
	1	2	3	4
Not Told Outcome	33.8	21.3	32.3	12.3
Told Outcome 1	57.2	14.3	15.3	13.4
Told Outcome 2	30.3	38.4	20.4	10.5
Told Outcome 3	25.7	17.0	48.4	9.9
Told Outcome 4	33.0	15.8	24.3	27.0

based only on the information available before the outcome was known. The results are shown in Figure 18.

The group not informed of any outcome judged the probability of Outcome 1 as 33.8 percent, while the group told that Outcome 1 was the actual outcome perceived the probability of this outcome as 57.2 percent. The estimated probability was clearly influenced by knowledge of the outcome. Similarly, the control group with no outcome knowledge estimated the probability of Outcome 2 as 21.3 percent, while those informed that Outcome 2 was the actual outcome perceived it as having a 38.4 percent probability.

An average of all estimated outcomes in six sub-experiments (a total of 2,188 estimates by 547 subjects) indicates that the knowledge or belief that one of four possible outcomes has occurred approximately doubles the perceived probability of that outcome as judged with hindsight as compared with foresight.

The relevance that subjects attributed to any datum was also strongly influenced by which outcome, if any, they had been told was true. As Roberta Wohlstetter has written, "It is much easier after the fact to sort the relevant from the irrelevant signals. After the event, of course, a signal is always crystal clear. We can now see what disaster it was signaling since

the disaster has occurred, but before the event it is obscure and pregnant with conflicting meanings."[154] The fact that outcome knowledge automatically restructures a person's judgments about the relevance of available data is probably one reason it is so difficult to reconstruct how our thought processes were or would have been without this outcome knowledge.

In several variations of this experiment, subjects were asked to respond as though they did not know the outcome, or as others would respond if they did not know the outcome. The results were little different, indicating that subjects were largely unaware of how knowledge of the outcome affected their own perceptions. The experiment showed that subjects were unable to empathize with how others would judge these situations. Estimates of how others would interpret the data without knowing the outcome were virtually the same as the test subjects' own retrospective interpretations.

These results indicate that overseers conducting postmortemevaluations of what analysts should have been able to foresee, given the available information, will tend to perceive the outcome of that situation as having been more predictable than was, in fact, the case. Because they are unable to reconstruct a state of mind that views the situation only with foresight, not hindsight, overseers will tend to be more critical of intelligence performance than is warranted.

Discussion of Experiments

Experiments that demonstrated these biases and their resistance to corrective action were conducted as part of a research program in decision analysis funded by the Defense Advanced Research Projects Agency. Unfortunately, the experimental subjects were students, not members of the Intelligence Community. There is, nonetheless, reason to believe the results can be generalized to apply to the Intelligence Community. The experiments deal with basic human mental processes, and the results do seem consistent with personal experience in the Intelligence Community. In similar kinds of psychological tests, in which experts, including intelligence analysts, were used as test subjects, the experts showed the same pattern of responses as students.

154. Roberta Wohlstetter, *Pearl Harbor: Warning and Decision* (Stanford, CA: Stanford University Press, 1962), p. 387. Cited by Fischhoff.

My own imperfect effort to replicate one of these experiments using intelligence analysts also supports the validity of the previous findings. To test the assertion that intelligence analysts normally overestimate the accuracy of their past judgments, there are two necessary preconditions. First, analysts must make a series of estimates in quantitative terms—that is, they must say not just that a given occurrence is probable, but that there is, for example, a 75-percent chance of its occurrence. Second, it must be possible to make an unambiguous determination whether the estimated event did or did not occur. When these two preconditions are present, one can go back and check the analysts' recollections of their earlier estimates. Because CIA estimates are rarely stated in terms of quantitative probabilities, and because the occurrence of an estimated event within a specified time period often cannot be determined unambiguously, these preconditions are seldom met.

I did, however, identify several analysts who, on two widely differing subjects, had made quantitative estimates of the likelihood of events for which the subsequent outcome was clearly known. I went to these analysts and asked them to recall their earlier estimates. The conditions for this mini-experiment were far from ideal and the results were not clear-cut, but they did tend to support the conclusions drawn from the more extensive and systematic experiments described above.

All this leads to the conclusion that the three biases are found in Intelligence Community personnel as well as in the specific test subjects. In fact, one would expect the biases to be even greater in foreign affairs professionals whose careers and self-esteem depend upon the presumed accuracy of their judgments.

Can We Overcome These Biases?

Analysts tend to blame biased evaluations of intelligence performance at best on ignorance and at worst on self-interest and lack of objectivity. Both these factors may also be at work, but the experiments suggest the nature of human mental processes is also a principal culprit. This is a more intractable cause than either ignorance or lack of objectivity.

The self-interest of the experimental subjects was not at stake, yet they showed the same kinds of bias with which analysts are familiar. Moreover, in these experimental situations the biases were highly resis-

tant to efforts to overcome them. Subjects were instructed to make estimates as if they did not already know the answer, but they were unable to do so. One set of test subjects was briefed specifically on the bias, citing the results of previous experiments. This group was instructed to try to compensate for the bias, but it was unable to do so. Despite maximum information and the best of intentions, the bias persisted.

This intractability suggests the bias does indeed have its roots in the nature of our mental processes. Analysts who try to recall a previous estimate after learning the actual outcome of events, consumers who think about how much a report has added to their knowledge, and overseers who judge whether analysts should have been able to avoid an intelligence failure, all have one thing in common. They are engaged in a mental process involving hindsight. They are trying to erase the impact of knowledge, so as to remember, reconstruct, or imagine the uncertainties they had or would have had about a subject prior to receipt of more or less definitive information.

It appears, however, that the receipt of what is accepted as definitive or authoritative information causes an immediate but unconscious restructuring of a person's mental images to make them consistent with the new information. Once past perceptions have been restructured, it seems very difficult, if not impossible, to reconstruct accurately what one's thought processes were or would have been before this restructuring.

There is one procedure that may help to overcome these biases. It is to pose such questions as the following: Analysts should ask themselves, "If the opposite outcome had occurred, would I have been surprised?" Consumers should ask, "If this report had told me the opposite, would I have believed it?" And overseers should ask, "If the opposite outcome had occurred, would it have been predictable given the information that was available?" These questions may help one recall or reconstruct the uncertainty that existed prior to learning the content of a report or the outcome of a situation.

This method of overcoming the bias can be tested by readers of this chapter, especially those who believe it failed to tell them much they had not already known. If this chapter had reported that psychological experiments show no consistent pattern of analysts overestimating the accuracy of their estimates, or of consumers underestimating the value of our product, would you have believed it? (Answer: Probably not.) If it had reported that psychological experiments show these biases to be

caused only by self-interest and lack of objectivity, would you have believed this? (Answer: Probably yes.) And would you have believed it if this chapter had reported these biases can be overcome by a conscientious effort at objective evaluation? (Answer: Probably yes.)

These questions may lead you, the reader, to recall the state of your knowledge or beliefs before reading this chapter. If so, the questions will highlight what you learned here—namely, that significant biases in the evaluation of intelligence estimates are attributable to the nature of human mental processes, not just to self-interest and lack of objectivity, and that they are, therefore, exceedingly difficult to overcome.

PART IV—CONCLUSIONS

Chapter 14

Improving Intelligence Analysis

This chapter offers a checklist for analysts—a summary of tips on how to navigate the minefield of problems identified in previous chapters. It also identifies steps that managers of intelligence analysis can take to help create an environment in which analytical excellence can flourish.

* * * * * * * * * * * * * * * * * * * *

How can intelligence analysis be improved? That is the challenge. A variety of traditional approaches are used in pursuing this goal: collecting more and better information for analysts to work with, changing the management of the analytical process, increasing the number of analysts, providing language and area studies to improve analysts' substantive expertise, revising employee selection and retention criteria, improving report-writing skills, fine-tuning the relationship between intelligence analysts and intelligence consumers, and modifying the types of analytical products.

Any of these measures may play an important role, but analysis is, above all, a mental process. Traditionally, analysts at all levels devote little attention to improving how they think. To penetrate the heart and soul of the problem of improving analysis, it is necessary to better understand, influence, and guide the mental processes of analysts themselves.

Checklist for Analysts

This checklist for analysts summarizes guidelines for maneuvering through the minefields encountered while proceeding through the analytical process. Following the guidelines will help analysts protect themselves from avoidable error and improve their chances of making the right calls. The discussion is organized around six key steps in the analytical process: defining the problem, generating hypotheses, collecting information, evaluating hypotheses, selecting the most likely hypothesis, and the ongoing monitoring of new information.

Defining the Problem

Start out by making certain you are asking—or being asked—the right questions. Do not hesitate to go back up the chain of command with a suggestion for doing something a little different from what was asked for. The policymaker who originated the requirement may not have thought through his or her needs, or the requirement may be somewhat garbled as it passes down through several echelons of management. You may have a better understanding than the policymaker of what he or she needs, or should have, or what is possible to do. At the outset, also be sure your supervisor is aware of any tradeoff between quality of analysis and what you can accomplish within a specified time deadline.

Generating Hypotheses

Identify all the plausible hypotheses that need to be considered. Make a list of as many ideas as possible by consulting colleagues and outside experts. Do this in a brainstorming mode, suspending judgment for as long as possible until all the ideas are out on the table.

Then whittle the list down to a workable number of hypotheses for more detailed analysis. Frequently, one of these will be a deception hypothesis—that another country or group is engaging in denial and deception to influence US perceptions or actions.

At this stage, do not screen out reasonable hypotheses only because there is no evidence to support them. This applies in particular to the deception hypothesis. If another country is concealing its intent through denial and deception, you should probably not expect to see evidence of it without completing a very careful analysis of this possibility. The deception hypothesis and other plausible hypotheses for which there may be no immediate evidence should be carried forward to the next stage of analysis until they can be carefully considered and, if appropriate, rejected with good cause.

Collecting Information

Relying only on information that is automatically delivered to you will probably not solve all your analytical problems. To do the job right, it will probably be necessary to look elsewhere and dig for more information. Contact with the collectors, other Directorate of Operations personnel, or first-cut analysts often yields additional information. Also check academic specialists, foreign newspapers, and specialized journals.

Collect information to evaluate all the reasonable hypotheses, not just the one that seems most likely. Exploring alternative hypotheses that have not been seriously considered before often leads an analyst into unexpected and unfamiliar territory. For example, evaluating the possibility of deception requires evaluating another country's or group's motives, opportunities, and means for denial and deception. This, in turn, may require understanding the strengths and weaknesses of US human and technical collection capabilities.

It is important to suspend judgment while information is being assembled on each of the hypotheses. It is easy to form impressions about a hypothesis on the basis of very little information, but hard to change an impression once it has taken root. If you find yourself thinking you already know the answer, ask yourself what would cause you to change your mind; then look for that information.

Try to develop alternative hypotheses in order to determine if some alternative—when given a fair chance—might not be as compelling as your own preconceived view. Systematic development of an alternative hypothesis usually increases the perceived likelihood of that hypothesis. "A willingness to play with material from different angles and in the context of unpopular as well as popular hypotheses is an essential ingredient of a good detective, whether the end is the solution of a crime or an intelligence estimate."[155]

Evaluating Hypotheses

Do not be misled by the fact that so much evidence supports your preconceived idea of which is the most likely hypothesis. That same evidence may be consistent with several different hypotheses. Focus on developing arguments *against* each hypothesis rather than trying to confirm hypotheses. In other words, pay particular attention to evidence or assumptions that suggest one or more hypotheses are *less* likely than the others.

Recognize that your conclusions may be driven by assumptions that determine how you interpret the evidence rather than by the evidence itself. Especially critical are assumptions about what is in another country's national interest and how things are usually done in that country. Assumptions are fine as long as they are made explicit in your analysis

155. Roberta Wohlstetter, *Pearl Harbor: Warning and Decision* (Stanford: Stanford University Press, 1962), p. 302.

and you analyze the sensitivity of your conclusions to those assumptions. Ask yourself, would different assumptions lead to a different interpretation of the evidence and different conclusions?

Consider using the matrix format discussed in Chapter 8, "Analysis of Competing Hypotheses," to keep track of the evidence and how it relates to the various hypotheses.

Guard against the various cognitive biases. Especially dangerous are those biases that occur when you lack sufficient understanding of how a situation appears from another country's point of view. Do not fill gaps in your knowledge by assuming that the other side is likely to act in a certain way because that is how the US Government would act, or other Americans would act, under similar circumstances.

Recognize that the US perception of another country's national interest and decisionmaking processes often differs from how that country perceives its own interests and how decisions are actually made in that country. In 1989–90, for example, many analysts of Middle Eastern affairs clearly assumed that Iraq would demobilize part of its armed forces after the lengthy Iran-Iraq war so as to help rehabilitate the Iraqi economy. They also believed Baghdad would see that attacking a neighboring Arab country would not be in Iraq's best interest. We now know they were wrong.

When making a judgment about what another country is likely to do, invest whatever time and effort are needed to consult with whichever experts have the best understanding of what that country's government is actually thinking and how the decision is likely to be made.

Do not assume that every foreign government action is based on a rational decision in pursuit of identified goals. Recognize that government actions are sometimes best explained as a product of bargaining among semi-independent bureaucratic entities, following standard operating procedures under inappropriate circumstances, unintended consequences, failure to follow orders, confusion, accident, or coincidence.

Selecting the Most Likely Hypothesis

Proceed by trying to reject hypotheses rather than confirm them. The most likely hypothesis is usually the one with the least evidence against it, not the one with the most evidence for it.

In presenting your conclusions, note all the reasonable hypotheses that were considered. Cite the arguments and evidence supporting your

judgment, but also justify briefly why other alternatives were rejected or considered less likely. To avoid ambiguity, insert an odds ratio or probability range in parentheses after expressions of uncertainty in key judgments.

Ongoing Monitoring

In a rapidly changing, probabilistic world, analytical conclusions are always tentative. The situation may change, or it may remain unchanged while you receive new information that alters your understanding of it. Specify things to look for that, if observed, would suggest a significant change in the probabilities.

Pay particular attention to any feeling of surprise when new information does not fit your prior understanding. Consider whether this surprising information is consistent with an alternative hypothesis. A surprise or two, however small, may be the first clue that your understanding of what is happening requires some adjustment, is at best incomplete, or may be quite wrong.

Management of Analysis

The cognitive problems described in this book have implications for the management as well as the conduct of intelligence analysis. This concluding section looks at what managers of intelligence analysis can do to help create an organizational environment in which analytical excellence flourishes. These measures fall into four general categories: research, training, exposure to alternative mind-sets, and guiding analytical products.

Support for Research

Management should support research to gain a better understanding of the cognitive processes involved in making intelligence judgments. There is a need for better understanding of the thinking skills involved in intelligence analysis, how to test job applicants for these skills, and how to train analysts to improve these skills. Analysts also need a fuller understanding of how cognitive limitations affect intelligence analysis and how to minimize their impact. They need simple tools and techniques to help protect themselves from avoidable error. There is so much research to be done that it is difficult to know where to start.

Scholars selected for tours of duty in the Intelligence Community should include cognitive psychologists or other scholars of various backgrounds who are interested in studying the thinking processes of intelligence analysts. There should also be post-doctoral fellowships for promising scholars who could be encouraged to make a career of research in this field. Over time, this would contribute to building a better base of knowledge about how analysts do and/or should make analytical judgments and what tools or techniques can help them.

Management should also support research on the mind-sets and implicit mental models of intelligence analysts. Because these mind-sets or models serve as a "screen" or "lens" through which analysts perceive foreign developments, research to determine the nature of this "lens" may contribute as much to accurate judgments as does research focused more directly on the foreign areas themselves.[156]

Training

Most training of intelligence analysts is focused on organizational procedures, writing style, and methodological techniques. Analysts who write clearly are assumed to be thinking clearly. Yet it is quite possible to follow a faulty analytical process and write a clear and persuasive argument in support of an erroneous judgment.

More training time should be devoted to the thinking and reasoning processes involved in making intelligence judgments, and to the tools of the trade that are available to alleviate or compensate for the known cognitive problems encountered in analysis. This book is intended to support such training.

Training will be more effective if supplemented with ongoing advice and assistance. An experienced coach who can monitor and guide ongoing performance is a valuable supplement to classroom instruction

156. Graham Allison's work on the Cuban missile crisis (Essence of Decision, Little, Brown & Co., 1971) is an example of what I have in mind. Allison identified three alternative assumptions about how governments work--the rational actor model, organizational process model, and bureaucratic politics model. He then showed how an analystÍs implicit assumptions about the most appropriate model for analyzing a foreign government's behavior cause him or her to focus on different evidence and arrive at different conclusions. Another example is my own analysis of five alternative paths for making counterintelligence judgments in the controversial case of KGB defector Yuriy Nosenko. Richards J. Heuer, Jr., "Nosenko: Five Paths to Judgment," *Studies in Intelligence*, Vol. 31, No. 3 (Fall 1987), originally classified Secret but declassified and published in H. Bradford Westerfield, ed., *Inside CIA's Private World: Declassified Articles from the Agency Internal Journal 1955-1992* (New Haven: Yale University Press, 1995).

in many fields, probably including intelligence analysis. This is supposed to be the job of the branch chief or senior analyst, but these officers are often too busy responding to other pressing demands on their time.

It would be worthwhile to consider how an analytical coaching staff might be formed to mentor new analysts or consult with analysts working particularly difficult issues. One possible model is the SCORE organization that exists in many communities. SCORE stands for Senior Corps of Retired Executives. It is a national organization of retired executives who volunteer their time to counsel young entrepreneurs starting their own businesses. It should be possible to form a small group of retired analysts who possess the skills and values that should be imparted to new analysts, and who would be willing to volunteer (or be hired) to come in several days a week to counsel junior analysts.

New analysts could be required to read a specified set of books or articles relating to analysis, and to attend a half-day meeting once a month to discuss the reading and other experiences related to their development as analysts. A comparable voluntary program could be conducted for experienced analysts. This would help make analysts more conscious of the procedures they use in doing analysis. In addition to their educational value, the required readings and discussion would give analysts a common experience and vocabulary for communicating with each other, and with management, about the problems of doing analysis.

My suggestions for writings that would qualify for a mandatory reading program include: Robert Jervis' *Perception and Misperception in International Politics* (Princeton University Press, 1977); Graham Allison's *Essence of Decision: Explaining the Cuban Missile Crisis* (Little, Brown, 1971); Ernest May's "*Lessons" of the Past: The Use and Misuse of History in American Foreign Policy* (Oxford University Press, 1973); Ephraim Kam's, *Surprise Attack* (Harvard University Press, 1988); Richard Betts' "Analysis, War and Decision: Why Intelligence Failures Are Inevitable," *World Politics,* Vol. 31, No. 1 (October 1978); Thomas Kuhn's *The Structure of Scientific Revolutions* (University of Chicago Press, 1970); and Robin Hogarth's *Judgement and Choice* (John Wiley, 1980). Although these were all written many years ago, they are classics of permanent value. Current analysts will doubtless have other works to recommend. CIA and Intelligence Community postmortem analyses of intelligence failure should also be part of the reading program.

To facilitate institutional memory and learning, thorough postmortem analyses should be conducted on all significant intelligence failures. Analytical (as distinct from collection) successes should also be studied. These analyses should be collated and maintained in a central location, available for review to identify the common characteristics of analytical failure and success. A meta-analysis of the causes and consequences of analytical success and failure should be widely distributed and used in training programs to heighten awareness of analytical problems.

To encourage learning from experience, even in the absence of a high-profile failure, management should require more frequent and systematic retrospective evaluation of analytical performance. One ought not generalize from any single instance of a correct or incorrect judgment, but a series of related judgments that are, or are not, borne out by subsequent events can reveal the accuracy or inaccuracy of the analyst's mental model. Obtaining systematic feedback on the accuracy of past judgments is frequently difficult or impossible, especially in the political intelligence field. Political judgments are normally couched in imprecise terms and are generally conditional upon other developments. Even in retrospect, there are no objective criteria for evaluating the accuracy of most political intelligence judgments as they are presently written.

In the economic and military fields, however, where estimates are frequently concerned with numerical quantities, systematic feedback on analytical performance is feasible. Retrospective evaluation should be standard procedure in those fields in which estimates are routinely updated at periodic intervals. The goal of learning from retrospective evaluation is achieved, however, only if it is accomplished as part of an objective search for improved understanding, not to identify scapegoats or assess blame. This requirement suggests that retrospective evaluation should be done routinely within the organizational unit that prepared the report, even at the cost of some loss of objectivity.

Exposure to Alternative Mind-Sets

The realities of bureaucratic life produce strong pressures for conformity. Management needs to make conscious efforts to ensure that well-reasoned competing views have the opportunity to surface within the Intelligence Community. Analysts need to enjoy a sense of security, so that partially developed new ideas may be expressed and bounced off

others as sounding boards with minimal fear of criticism for deviating from established orthodoxy.

Much of this book has dealt with ways of helping analysts remain more open to alternative views. Management can help by promoting the kinds of activities that confront analysts with alternative perspectives—consultation with outside experts, analytical debates, competitive analysis, devil's advocates, gaming, and interdisciplinary brainstorming.

Consultation with outside experts is especially important as a means of avoiding what Adm. David Jeremiah called the "everybody-thinks-like-us mindset" when making significant judgments that depend upon knowledge of a foreign culture. Intelligence analysts have often spent less time living in and absorbing the culture of the countries they are working on than outside experts on those countries. If analysts fail to understand the foreign culture, they will not see issues as the foreign government sees them. Instead, they may be inclined to mirror-image—that is, to assume that the other country's leaders think like we do. The analyst assumes that the other country will do what we would do if we were in their shoes.

Mirror-imaging is a common source of analytical error, and one that reportedly played a role in the Intelligence Community failure to warn of imminent Indian nuclear weapons testing in 1998. After leading a US Government team that analyzed this episode, Adm. Jeremiah recommended more systematic use of outside expertise whenever there is a major transition that may lead to policy changes, such as the Hindu nationalists' 1998 election victory and ascension to power in India.[157]

Pre-publication review of analytical reports offers another opportunity to bring alternative perspectives to bear on an issue. Review procedures should explicitly question the mental model employed by the analyst in searching for and examining evidence. What assumptions has the analyst made that are not discussed in the draft itself, but that underlie the principal judgments? What alternative hypotheses have been considered but rejected, and for what reason? What could cause the analyst to change his or her mind?

Ideally, the review process should include analysts from other areas who are not specialists in the subject matter of the report. Analysts within the same branch or division often share a similar mind-set. Past experience with review by analysts from other divisions or offices indi-

157. Transcript of Adm. David Jeremiah's news conference at CIA, 2 June 1998.

cates that critical thinkers whose expertise is in other areas make a significant contribution. They often see things or ask questions that the author has not seen or asked. Because they are not so absorbed in the substance, they are better able to identify the assumptions and assess the argumentation, internal consistency, logic, and relationship of the evidence to the conclusion. The reviewers also profit from the experience by learning standards for good analysis that are independent of the subject matter of the analysis.

Guiding Analytical Products

On key issues, management should reject most single-outcome analysis—that is, the single-minded focus on what the analyst believes is probably happening or most likely will happen. When we cannot afford to get it wrong, or when deception is a serious possibility, management should consider mandating a systematic analytical process such as the one described in Chapter 8, "Analysis of Competing Hypotheses." Analysts should be required to identify alternatives that were considered, justify why the alternatives are deemed less likely, and clearly express the degree of likelihood that events may not turn out as expected.

Even if the analyst firmly believes the odds are, say, three-to-one against something happening, that leaves a 25-percent chance that it will occur. Making this explicit helps to better define the problem for the policymaker. Does that 25-percent chance merit some form of contingency planning?

If the less likely hypothesis happens to be, for example, that a new Indian Government will actually follow through on its election campaign promise to conduct nuclear weapons testing, as recently occurred, even a 25-percent chance might be sufficient to put technical collection systems on increased alert.

Verbal expressions of uncertainty—such as possible, probable, unlikely, may, and could—have long been recognized as sources of ambiguity and misunderstanding. By themselves, most verbal expressions of uncertainty are empty shells. The reader or listener fills them with meaning through the context in which they are used and what is already in the reader's or listener's mind about that subject. An intelligence consumer's interpretation of imprecise probability judgments will always be biased in favor of consistency with what the reader already believes. That means the intelligence reports will be undervalued and have little impact on the

consumer's judgment. This ambiguity can be especially troubling when dealing with low-probability, high-impact dangers against which policymakers may wish to make contingency plans.

Managers of intelligence analysis need to convey to analysts that it is okay to be uncertain, as long as they clearly inform readers of the degree of uncertainty, sources of uncertainty, and what milestones to watch for that might clarify the situation. Inserting odds ratios or numerical probability ranges in parentheses to clarify key points of an analysis should be standard practice.

The likelihood of future surprises can be reduced if management assigns more resources to monitoring and analyzing seemingly low-probability events that will have a significant impact on US policy if they do occur. Analysts are often reluctant, on their own initiative, to devote time to studying things they do not believe will happen. This usually does not further an analyst's career, although it can ruin a career when the unexpected does happen. Given the day-to-day pressures of current events, it is necessary for managers and analysts to clearly identify which unlikely but high-impact events need to be analyzed and to allocate the resources to cover them.

One guideline for identifying unlikely events that merit the specific allocation of resources is to ask the following question: Are the chances of this happening, however small, sufficient that if policymakers fully understood the risks, they might want to make contingency plans or take some form of preventive or preemptive action? If the answer is yes, resources should be committed to analyze even what appears to be an unlikely outcome.

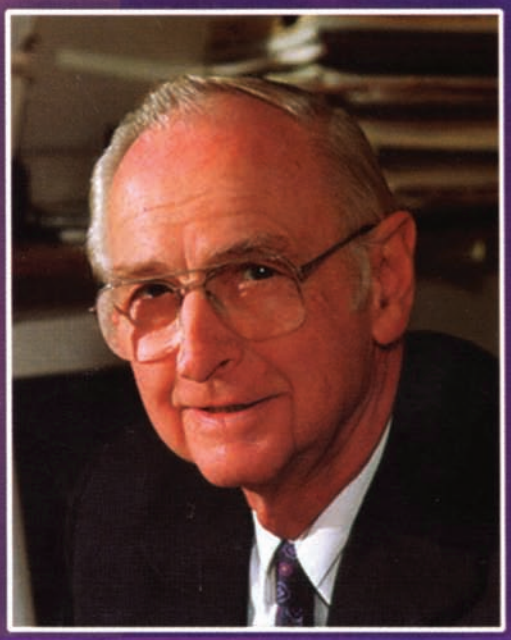
Managers of intelligence should support analyses that periodically re-examine key problems from the ground up in order to avoid the pitfalls of the incremental approach. Receipt of information in small increments over time facilitates assimilation of this information to the analyst's existing views. No one item of information may be sufficient to prompt the analyst to change a previous view. The cumulative message inherent in many pieces of information may be significant but is attenuated when this information is not examined as a whole.

Finally, management should educate consumers concerning the limitations as well as the capabilities of intelligence analysis and should define a set of realistic expectations as a standard against which to judge analytical performance.

The Bottom Line

Analysis can be improved! None of the measures discussed in this book will guarantee that accurate conclusions will be drawn from the incomplete and ambiguous information that intelligence analysts typically work with. Occasional intelligence failures must be expected. Collectively, however, the measures discussed here can certainly improve the odds in the analysts' favor.

The Author



Richards J. Heuer, Jr. worked for the CIA for nearly 45 years—first as a staff officer from 1951 until his retirement in 1979 and then as a contractor on a variety of projects until 1995. He began his career in the Directorate of Operations and later transferred to the Directorate of Intelligence, where he headed the unit working on analytic methods in the Office of Political Analysis. He is now a consultant for the Defense Security Service's Security Research Center in Monterey, California.

Mr. Heuer was awarded the Agency Seal Medallion in 1987 for developing and teaching an innovative methodology for addressing complex and challenging problems facing the Intelligence Community. He was recognized in 1988 for his "outstanding contribution to the literature of intelligence," and again in 1996 for "superior accomplishment." In addition to his work on the psychology of intelligence analysis, Mr. Heuer is a published author on counterintelligence, deception, analytical methodology, and personnel security issues.

Many of the chapters in this book were originally written for the Directorate of Intelligence in the 1980s. They were recently edited and assembled, along with additional material that Mr. Heuer prepared specifically for this book, under the auspices of the CIA's Center for the Study of Intelligence.

I have been a fan of Richards Heuer ever since I met him and read some of his material 20 years ago. This book combines Dick's many years of experience with his extensive knowledge of psychological research. He examines impediments to good intelligence analysis and points the way to how to overcome them. The volume should be of real assistance to people faced with the need to draw sound estimates from changing and ambiguous information.

ABSTRACT

This paper explores analysis in intelligence and evaluates a proposal to certify and convey analytical rigor as it relates to intelligence products. To accomplish this, an examination of intelligence failures is conducted to assess the application of analytical rigor across historic case studies. The historic failures demonstrate gaps in standardization and insufficiencies in analytical rigor. This paper proposes establishing unit level certified Masters of Analytic Tradecraft (MAT) analysts to be trained and entrusted to evaluate and rate the standards and analytical rigor of intelligence products prior to publication. This certification model is based on research of the structure of professional civilian corporations. Implementing the MAT analyst certification will allow decision-makers the ability to judge when analysis is robust or shallow so that they can meter their trust accordingly. This certification will hold the IC accountable in their adherence to the established analytical standards, ensure compliance is properly conveyed, and promote a quality of analysis.

Section 1: INTRODUCTION

Research has shown the difficulty in recognizing inadequacies of analytical rigor when consuming intelligence analysis within information domains.[1] For the purposes of this paper, analytical rigor is defined as "an emergent multi-attribute measure of sufficiency."[2] The term analytic rigor is used to convey the level of analytic tradecraft application: sometimes robust and other times weak. Decision makers should be provided "with actionable data backed by analytical rigor."[3] When evaluating a problem-set, an intelligence consumer's perceived analytical rigor (based on perceived cues) ideally should meet or exceed effective rigor (based on analytical process).[4] To accomplish this, decision makers should not be left to their own perceptions in judging the analytic rigor of given intelligence product, they need to be provided fidelity on the level of analytical rigor; they need to know when analysis is robust or shallow so that they can meter their trust accordingly.

Unfortunately, examples of high-consequence, high profile intelligence fails have been common, revealing a consistent lack of analytical sufficiency and raising concerns about the condition of United States (U.S.) intelligence.[5] The 2003 assessment of Iraq's weapons of mass destruction (WMD) is one example of a catastrophic failure on the part of the IC.[6] The WMD Commission Report summarized the assessment failures that informed the 2003 invasion of Iraq in this way: "This failure was in large part the result of analytical shortcomings; intelligence analysts were too wedded to their assumptions about Saddam's intentions... We conclude that the Intelligence Community was dead wrong in almost all of its pre-war judgments about Iraq's weapons of mass destruction…[there existed] serious errors in analyzing… [and a] failure to make clear just how much of its analysis was based on assumptions, rather than good evidence…"[7]

Where it is typical for analysts to use tradecraft language to convey likeliness and confidence, no such effort is afforded to articulating analytical rigor. If an assurance of standards and a conveyed level of rigor accompanied assessment, it would empower decision makers as they evaluate and measure the level of confidence they should apply to the assessment. U.S. law has mandated that that the Office of the Director of National Intelligence (ODNI) conduct post-production, after-action quality assurance spot checks, however there is not a universal method or qualifying standard of analytical rigor prior to the publication of intelligence reports. Perceived levels of rigor can be misled by the appearance product quality, with the perception of "sufficient rigor" evolving once insight to the analytical process is provided. [8]

The application of a certification model will challenge analysts and organizations to meet higher levels of analytical rigor while providing process insight to decision makers. In the civilian world certifications are used to help regulate professional fields such as medicine, law, and engineering by: 1) establishing minimally acceptable standards, 2) providing accountability and reassuring consumers that the professionals are deserving of trust, 3) improving quality by providing guidance and by capturing and disseminating best practices.[9] The U.S. Green Building Council (USGBC), an organization that promotes sustainability-focused construction practices, has a unique approach in their Leadership in Energy and Environmental Design (LEED) program.[10] USGBC not only credentials its associates (builders, architects, designers), but has a four tiered rating system to certify standards of construction for a given project. The LEED tiered rating system quantifies and clearly conveys that standard to consumers.

This paper will evaluate the achievability of certifying intelligence products by first

providing context and initial historical and current analysis of intelligence practices. It will define sufficiency of analytical rigor by evaluating its independent attributes and analyzing how ODNI, and the Air Force guidance define analytical standards. A proposal for both an analyst and pre-publication product certification process will be presented and evaluated to assess if a certification process should be incorporated across the IC and whether or not that process would or would not affect how analytical rigor is conveyed to decision makers.

Section 2: BACKGROUND

Today, seventeen agencies and organizations comprise the IC, with over 1,200 sub-organizations and over 1,900 private companies, comprising a 50+ billion dollar budget and employ over 800,000 people with TOP SECRET clearances.[11] Its collective analytical might culminates in intelligence reports like the *President's Daily Brief* (PDB), *Worldwide Intelligence Review* (WIRe), *National Intelligence Estimate* (NIE), *Secretary of Defense/Chairman of the Joint Chiefs of Staff Daily Intelligence Update* (SECDEF/CJCS J2 Daily Intelligence Update), and the *Secretary's Morning Summary* (SMS).[12] The IC's effectiveness has been the topic of much investigation. How analysis is accomplished and communicated varies greatly across the IC's 17 agencies and organizations, which continually battle tendencies to stovepipe information behind shrouds of secrecy and "need-to-know" compartmentalized barriers. Many experts have pointed to an IC that is obsessed with the churn of data and overly focused on the tactical and current intelligence needed to impact the tactical battlefield in real-time; going as far to reference this phenomena as "tyranny": the tyranny of current intelligence, tyranny of taskings, tyranny of daily operations, and the tyranny of the immediate to name a few.[13] Although valued by its consumers, a focus on the immediate

has detracted from the strategic intelligence priorities that inform national level decision makers and requires deep understanding required for strategic, long-term analysis.[14] The propagation of information and the availability of real-time interconnected data has "exacerbated the risk of shallow information analysis."[15] Where a tactical real-time focus can save lives and assists in capturing adversaries on the battlefield, strategic intelligence has the power to both justify and deter wars. Under production pressures, this collection-driven, real-time focus is much desired by war-fighters, albeit at the detriment of deep understanding; lacking the sustained expert scrutiny required to do the long-term analysis necessary to evaluate and inform strategic problem-sets. Tactical and strategic assessments are not mutually exclusive, for they inform one another. A strategic, deep understanding of a target-system or a target-country is informed through the aggregation of hundreds, if not thousands of tactical and operational assessments.

The 2008 RAND repot, *Assessing the Tradecraft of Intelligence Analysis*, phrases this tension as "intelligence reporting" verses "intelligence analysis;" intelligence reporting requiring little if any critical thinking, application of tradecraft, or utilization of structured analytical techniques.[16] This same report suggested: "The need for a focal point in analysis, and analytic tradecraft is striking, and this need will only grow as the Community strives to be more 'joint' in the wake of the December 2004 intelligence reform law and the creation of a director of national intelligence."[17] Community-wide standards are essential for analysts to be effective in how they communicate assessments to their customers.

The "intelligence process" pulls collection from the operational environment, takes that data and processes it into information. [18] Once put through the rigors of analysis, information then becomes intelligence. Actionable, timely, and relevant intelligence informs national decision makers and the warfighter consumers. This requirement driven intelligence process is enabled through analysis, which is the "thinking" part of intelligence.[19] Analysis is the pursuit of

situational understanding and thus facilitates the goal of bold, predictive, and informative assessments. The tradecraft of analysis is the underpinning of the intelligence cycle and is key to the development of deliverable intelligence.[20]

A review of intelligence failures has shown deficiencies in analysis to be a consistent cause of IC shortcomings.[21] Poor application of analytical tradecraft standards, not employing structured analytic techniques, and applying levels of mediocre analytical rigor have caused strategic assumptions, dating back over a half century, which were not appropriately challenged. Some examples include: the 1962 Cuban Missile Crisis, the 1973 Yom Kippur War, the 1989 German Unification, and the 1998 Indian Nuclear Test.[22]

Effective analysis is the key to preventing shortfalls such as those highlighted in the surprise attacks of September 11th. The 9-11 Commission relied on Staff Statement No. 11, The *Performance of the Intelligence Community* to inform their understanding of the IC's performance leading up to the September 11 attacks on the United States. This document described how the IC's emphasis on analysis waned in the 1990's as budgets cuts prevailed and competition with operations and collection further detracted from the importance of analysis.[23] Analysis competed with the introduction of the 24-hour news cycle and analytical production was driven away from strategic, long-range, deep analysis and instead shifted towards current, tactical intelligence. The Intelligence Reform and Terrorism Prevention Act of 2004 (IRTPA) acted on these shortfalls and mandated that the Director of National Intelligence convey analytical tradecraft standards and implement processes to ensure that the Intelligence Community production meets a standard of high analytical rigor.[24]

An analysis of the 2002 National Intelligence Estimate (NIE) on Iraq's weapons of mass destruction (WMD) and the prewar intelligence leading up to the invasion of Iraq was accomplished by the Senate Select Committee on Intelligence (SSCI), which exposed significant

analytical shortcomings. [25] This extensive review highlighted that groupthink dynamics, failure to challenge key assumptions, and instances of low rigor analysis that built on previous reports without critically challenging their findings were all contributing factors that led to a misleading, low-rigor analytical assessment.[26] An additional review, the *2005 Commission on the Intelligence Capabilities of the United States Regarding Weapons of Mass Destruction* (The Robb-Silberman Report), confirmed the need to more thoroughly train analysts on analytical tradecraft requirements and emphasized the need for analysts to challenge assumptions through heightened analytical rigor.[27]

Recent intelligence case studies further highlight the need for increased analytical rigor. These cases include how the IC failed to predict the 2012 attacks on the U.S. Embassy in Benghazi, underestimated the 2014 rise of the Islamic State in Iraq, and failed to predict the 2014 Russian invasion of Crimea. The retrospective review of these recent examples is still ongoing and has yet to be fully evaluated. The exception is the 2014 Senate Intelligence Committee report, *S. Rpt. 113-134 Review of the Terrorist Attacks on U.S. Facilities in Benghazi, Libya, September 11-12, 2012*, which is one of seven investigations on the topic containing varying degrees of focus on the State Department and specifically Secretary Hillary Clinton's role. This particular report focuses on the analysis and actions of the IC and poor application of rigor and lack of emphasis in conducting open-source analysis.[28]

The lessons from these failures require evaluation and application to the ever-changing and challenging intelligence environment of today. Analysts should not only understand their target systems and target countries through their available collection sources; they must also be able to identify nuanced inferences and cultural undertones in their analysis. Operating in an environment of fragmented ambiguity, with undefined adversaries, they are presented with challenging and evolving problem-sets. Analysts are expected to provide thorough analysis with limited time,

scarce resources, evolving technologies, complex geostrategic conditions and extremely agile adversaries. The IC is asked to be predictive, assessing intent and understanding the probability of events that have yet to occur. The IC is operating under the pressures of ongoing, time critical wars, and is continually fighting to identify and prevent the next catastrophic event. The IC strives to be right 100% of the time, where the adversary only needs to be right once. It is a daunting challenge, which requires adaptability and agility. It is a challenge that must be approached methodically with a sustained and communicated application of analytical rigor.

The Intelligence Reform and Terrorism Prevention Act of 2004 (IRTPA) provided a foundational change in its mandate to establish a Director of National Intelligence (DNI) "to be responsible for ensuring that finished intelligence products produced by any element or elements of the intelligence community are timely, objective, independent of political considerations, based upon all sources of available intelligence, and employ the standards of proper analytic tradecraft".[29] IRTPA additionally mandated for the DNI to assign an individual responsible to establish processes to ensure "alternative analysis" (commonly referred to as structured analytic techniques (SATs)), and perform regular reviews of finished intelligence products in order to "draft lessons learned, identify best practices, or make recommendations for improvement to the analytic tradecraft." The Office of the Director on National Intelligence established a Deputy Director of National Intelligence for Intelligence Integration (DDNI/II) who then established the Mission Integration Division's Analytic Integrity and Standards group (AIS). The AIS was established to stimulate analytic integrity, promote rigor, encourage learning, and institutionalize tradecraft across the analytic community.[30] The ODNI's Analytic Integrity and Standards group has a unique requirement to evaluate samples of the IC's analytical products for adherence to the nine analytic tradecraft standards identified in ICD 203. To do this, AIS staff evaluators are thoroughly trained

(but not certified) to use a published rating scale to ensure that they evaluate sampled intelligence products and analysis in a fair, consistent, measured, and largely unbiased manner.

On 21 June 2007, the AIS presented a milestone effort in the publication of *Intelligence Community Directive 203, Analytic Standards* (ICD 203). ICD 203 was intended to serve as a foundational document, seeding IC training and education initiatives while promoting a culture of analytic rigor and excellence. Additionally, ICD 203 serves as the pre-production baseline, and the post-intelligence standard by which the ODNI evaluates IC analytic products. While the ICD 203 presents 14 different analytic and analytic tradecraft standards, it is a mere five and a half pages long, including introductory materials and a section outlining the DDNI//II responsibilities. ICD 203 provides the expectations of analytic standards, but does little to describe how these standards should be applied. As a compliment to ICD 203, the ODNI has published a *Rating Scale for Evaluating Analytic Tradecraft Standards*, which is primarily intended to guide ODNI evaluators in their analysis of post-production intelligence products, but also encouraged as a guide for analysts to enhance their tradecraft. As an impromptu survey to judge penetration of these ODNI initiatives, thirty professional Air Force intelligence analysts, officers and enlisted, across three unique and independent squadrons (two geospatial targeting squadrons, two cyber intelligence, reconnaissance, and surveillance squadrons, and one remotely piloted aircraft squadron) were asked if they knew of the existence of these foundational, standard setting documents; none had any awareness of ICD 203 or the rating scale, evaluation document.

With the 29 March 2016 publication of Air Force Instruction 14-133, *Intelligence Analysis* (AFI 14-133), the Air Force is set to improve organization-wide visibility of analytical standards. AFI 14-133 is the Air Force's attempt to recognize the foundational importance of analysis and to codify standards, roles, and responsibilities. It focuses primarily on Air Force level, Major Command (MAJCOM) and National Air and Space Intelligence Center roles and responsibilities.

How this regulation will translate to unit level analysis, adaption rates, and cultural change are all unknowns as it relates to the Air Force's effort to translate ICD 203's tradecraft standards across the entirety AF ISR Enterprise.

While Congressional reports have identified issues at a surface level, an abundance of additional research conducted in the timeframe since 9-11has provided both retrospective and forward thinking assessments on the state of analysis across the IC. *The 9-11 Commission Report* states that there is a, "Lack of common standards and practices across the foreign-domestic divide…holding the work—wherever it is done—to a common standard of quality in how it is collected, processed (e.g., translated), reported, shared, and analyzed…"[31] The 2008 RAND report identified "quality of intelligence" as the number one most frequently mentioned analytic concern, with 54% of respondents identifying the issue in interviews.[32] Mr. Jeffrey Cooper, a senior Central Intelligence Agency (CIA) analyst has identified the analytical pathologies that permeate all levels of analysis across the entirety of the IC.[33] He and many others have emphasized and praised the standards found in the professional practices of law, medicine, and science and offer tools, both practical and cognitive, which can be leveraged to improve the tradecraft of analysis. David Moore, career senior analysts at the National Security Agency (NSA), authored both 2007 *Critical Thinking and Intelligence Analysis* and 2011 *Sensemaking: A Structure For An Intelligence Revolution,* arguing that critical thinking needs to be woven into the process of analysis in order to maximize an analyst's ability to produce effective intelligence assessments while minimizing the potential for intelligence failures. Another prolific author in the field is Richard Heuer. Heuer, a CIA veteran whose research on structure analytical techniques (SAT) is the foundation for the Air Force's 14N Intelligence Officer analysis teachings, emphasizes separate analytical techniques that range across eight different categories of analysis, thus informing much of the research to follow.

Doctors Daniel Zelik, Emily Patterson, and David Woods from Ohio State University published two Department of Defense sponsored papers, *Understanding Rigor in Information Systems* and *Judging Sufficiency: How Professional Intelligence Analysts Assess Analytical Rigor*, which highlight the importance of analytical rigor and evaluate how sufficiency of rigor is perceived and communicated.[34] These papers explore the attributes of analytical rigor, and describe rigor as building on a process-driven approach of standardized adherence and achieved sufficiency. The researchers built an attribute-based metric to assess analytical rigor against eight unique attributes as shown in Figure 1 below.

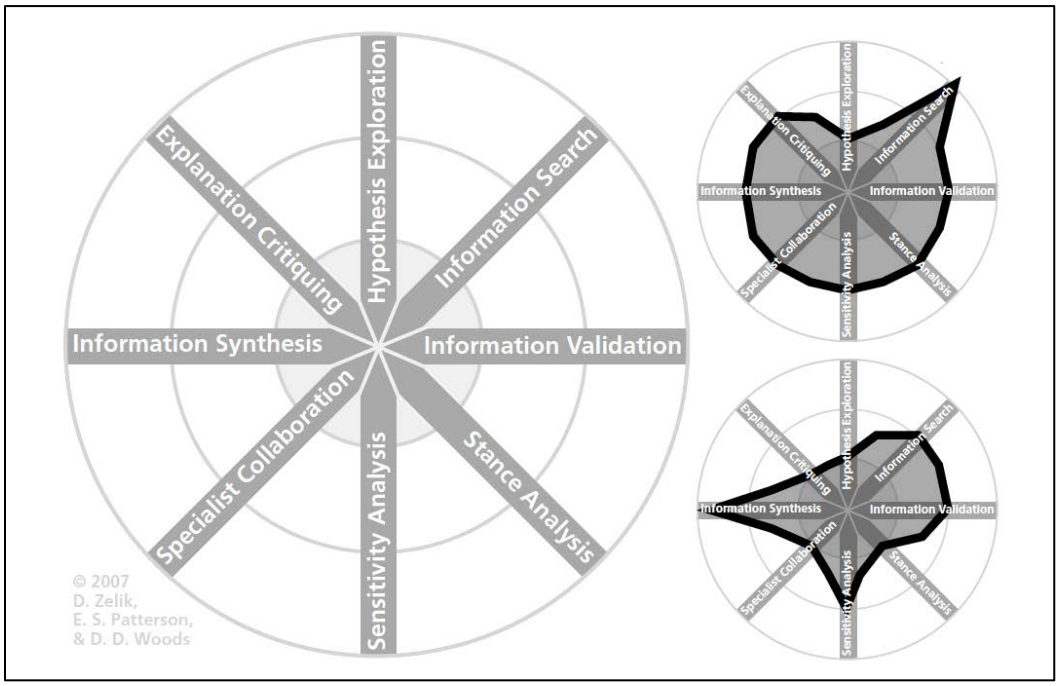

Figure 1. Visualization of Zelik, et al. Rigor Metric (Adapted from Understanding Rigor in Information Analysis, 2007)

Zelik et al. underscore the pressures driving analysts to low rigor analysis, including data rich overload and production pressure. In turn, it is extremely difficult for decision makers to recognize insufficient rigor balanced against a given decision and the consequences of failure. The above rigor metric helps frame an understanding of analytical rigor, which can be leveraged to

reduce shallow analysis by bolstering and conveying analytical rigor visually. Zelik et al. recommend a "participatory exchange model" in which the analysts and decision makers have a dialogue on analytical rigor as opposed to a one-way transfer of information. Zelik et al. apply this model to a briefing type exchange, but a logical inference would suggest that conveying analytical rigor along with written intelligence reports would also have similar value.

Advanced analysis brings a high level of analytical rigor and applied tradecraft in order to fulfill sufficiency to the above stated measurables. To achieve rigor, both critical thinking and structured analytic techniques (SATs) should be applied. Structured analytic techniques are used to challenge assessments, identify cognitive bias, stimulate creativity, and measure uncertainty.[35] SATs include mental network analysis, structured brainstorming, analysis of competing hypothesis, red hat analysis, pre-mortem analysis, devil's advocacy, and structured debate to name a few.[36] These techniques fall into broad categories like visualization, decomposition, challenge analysis, idea generation, hypothesis generation/testing, and others. SATs are a process driven approach that when combined with intuition, critical thinking, and subject matter expertise reduce analytical error and promote quality, effective, and rigorous analysis.

Section 3: SUFFICIENCY OF ANALYTICAL RIGOR

ICD 203 and Joint Publication 2-0, Joint *Intelligence* both articulate an expectation of analytical rigor required to facilitate the intelligence process, but in close review of these documents, the expected level of rigor is not specifically defined, quantified, or communicated.[37] They have not provided any process or training required to achieve this standard, nor have they provided the mechanism for analysts to communicate a measure of applied rigor. This is not to say that standards do not exist; in ICD 203 tradecraft standards are classified into five "Analytic Standards" which include nine "Analytic Tradecraft Standards."[38] ICD 203 introduces these broad

categories of expectations in just a two-page overview and goes no further.[39] A literary review quickly provides a depth of academic thought on how things like structured analytical techniques, estimative language, sourcing, assumption checks, critical thinking, alternative hypotheses exploration, should be applied, but the academic explanation does not translate well to regulatory guidance. Derived from and similar to ICD 203, AFI 14-133 again labels and categorizes analytic standards, but does little else to elaborate on the processes required to facilitate and achieve success. Additionally, AFI 14-133 uses slightly different terminology than ICD 203, showing that the Air Force's attempt to convey and uphold standards breaks down quickly as the two documents are unable to agree on which standards to uphold and how they should be labeled. For example, the Air Force has injected confusion by introducing "Tenants" in the place of ICD 203's "Analytic Standards", and using "Integrity" in place of "Independent of political consideration." To highlight the differences between ICD 203 and AFI 14-133, Table 1 below lists the standards as conveyed in the respective documents. This example shows how quickly ICD 203's standards migrated with the publication of the Air Force Instruction. How the remaining 15 members of the IC implement ICD 203's standards were not analyzed.

ICD 203 Analytic Standards	AFI 14-133 Intelligence Analysis
Analytic Standards	AF Intelligence Analysis Tenets
a. Objective	3.1.1. Objectivity
b. Independent of political consideration	3.1.2. Integrity
c. Timely	3.1.3. Synthesis
d. Based on all available sources of intelligence information	3.1.4. Collaboration
e. Implements and exhibits Analytic Tradecraft Standards, specifically:	3.1.5. Anticipation
(1) Properly describes quality and credibility of underlying sources, data, and methodologies	3.1.6. Requirements
(2) Properly express and explains uncertainties associated with major analytic judgments	AF Intelligence Analysis Standards
(3) Properly distinguishes between underlying intelligence information and analysts' assumptions and judgments	3.2.1. Timeliness
(4) Incorporates analysis of alternatives	3.2.2. Appropriate Sourcing
(5) Demonstrates consumer relevance and address implications	3.2.3. Accuracy
(6) Uses clear and logical argumentation	3.2.4. Level of Confidence
(7) Explains change to or consistency of analytic judgments	3.2.5. Assumptions vs. Judgements
(8) Makes accurate judgments and assessments	3.2.6. Analysis of Alternatives
(9) Incorporates effective visual information	3.2.7. Relevance
	3.2.8. Logical Argumentation
	3.2.9. Utility
	3.2.10. Customer Engagement

Table 1. ICD 203 Standards compared to AFI 140-133 Standards

Additionally, the AFI 14-202 *Intelligence* series provides regulatory guidance to the Air Force intelligence enterprise across three independent volumes; *Training, Standards and Evaluation*, and *General Intelligence Rules,* but does not expand upon or reference the overarching intelligence standards that have been directed by the Office of the Director of National Intelligence; ICD 203. The ODNI attempts to provide the IC with the principles of analysis through a top down application of analytical standards, but these standards do not penetrate to line unit analysts. With AFI 14-133 introducing the service to analytic standards, the regulation falls well short of defining and delineating analytical rigor. This regulation suggests to its readers that one must meet all of the standards, but fails to provide measures of success. The ODNI's *Rating Scale for Evaluating Analytic Tradecraft Standards* provides what the Air Force has failed to adapt, it acknowledges that analysis is not binary; that there are variations in quality and sufficiency. The ODNI rating scale is

intended primarily for ODNI evaluators to conduct post-production evaluations. This document provides amplified guidance for evaluators and assists them in judging ICD 203 compliance on a scale of: Poor (0), Fair (1), Good (2), and Excellent (4). ODNI evaluators provide post-production quality control for review purposes. This information is currently not shared with intelligence consumers or decision makers, thus having a tool to provide consumers a rating of effective rigor and analytic compliance, but not sharing the information. The historical failures previously discussed in this paper have shown that when decision makers perceive a sufficient amount rigor, yet the rigor is weak, it can result in catastrophic consequences.

Expected dialog between analysts and consumers is implied in the evaluation and feedback section of the intelligence process, but this feedback process has limited structure. At best, an intelligence product goes out and feedback comes back. There are many mechanisms to facilitate this type of feedback, but this does not meet the expectation of dialogue. Dialogue, as opposed to monologue, requires two-way communication. There is an expectation by the intelligence consumer that the analysis being presented is sufficiently rigorous yet there is currently no systematic mechanism or standard for an analyst to quantify, convey, and certify analytical rigor prior to publication of intelligence products. The IC's current evaluation capabilities are in compliance with the *Intelligence Reform and Terrorism Prevention Act of 2004* requirements to conduct postproduction, after action reviews. Rigor and accuracy are mutually exclusive; one does not guarantee the other. This is understood in the tradecraft, and indeed the ICD 203 analytic tradecraft standard requiring analysts to "properly express and explain uncertainties associated with major analytic judgments" was established to standardize how confidence levels and expressions of likelihood are conveyed to consumers, which is different than conveying rigor. It is safe to say that national policymakers consuming a National Intelligence Estimate would expect high rigor, where a combatant commander digesting current intelligence might accept the risk of low analytical rigor

given time constraints or limited corroboration. High rigor analysis can appropriately result in a low confidence assessment.

Section 4: PROPOSAL

This paper will analyze the impacts and costs of establishing an ODNI center of excellence, a schoolhouse designed to train and certify Masters of Analytic Tradecraft (MAT) analysts. The primary purpose of MAT analysts is to evaluate and rate intelligence products for adherence to ICD 203 *Analytic Standards* and to assess and convey analytical rigor to production analysts and intelligence consumers. The ODNI's Analytic Integrity and Standards group (AIS) currently has evaluation and rating processes that are employed to assess post publication intelligence as spot-check, quality control, and review mechanisms in accordance with section 1019 of the *Intelligence Reform and Terrorism Prevention Act of 2004*, "shall perform, on a regular basis, detailed reviews of finished intelligence product(s)."[40] MAT analysts and their evaluation capability would differ from and potentially complement existing AIS processes in that MAT analysts would 1) be embedded at the unit and organizational levels, 2) evaluate intelligence reporting prior to publication, 3) exponentially robust current efforts in manpower and capability, and 4) culturally build a cadre across the Intelligence Community that is focused of ICD 203 compliance and the adherence to analytical rigor expectations. Certified MAT analysts will be effectively trained to certify the level of analytical rigor prior to publication of intelligence publications. This certification will accompany the intelligence report in the form of a unique and branded label, thus providing a simple, standardized, and easily recognizable conveyance of analytical rigor that is stamped with the license number of the MAT analysts thus communicating an authoritative assessment of analytical rigor and adherence to ICD 203 *Analytic Standards*.

Figure 2. Proposed MAT Rating Badges (as conceptualized by the author)

Evaluations and MAT certifications of analytical rigor will be a unique capability of certified MAT analysts. Only certified MAT analysts will be empowered to evaluate and certify intelligence products. The following analysis will determine if an AIS sponsored schoolhouse, certified MAT analysts, certified intelligence products would or would not increase adherence to ICD 203 standards and improve the culture of analytical rigor across IC.

Section 5: RESEARCH METHODOLOGY

The following analysis evaluates the above proposal utilizing the following criteria:

Evaluation Criterion 1: Effectiveness

Criterion one will analyze how effective given proposals might be towards achieving the goals of promoting and conveying analytical rigor across the IC, ensuring that the rigor is standardized, and assessing how effective a given proposal might be in facilitating communication. It is recognized that given the classified nature of the materials and the limited amount of unclassified data, effectiveness will be difficult to measure.

Evaluation Criterion 2: Implementation

The proposal will be evaluated against identified barriers to implementation. Along this line, the evaluation will strive to understand and identify barriers such as training, manpower, and support requirements. From a resourcing perspective, proposals will be evaluated for cost

effectiveness and will explore resourcing implications.

Evaluation Criterion 3: Adaptation

The adaption is the final criterion by which proposed processes will be evaluated. Factors effecting adaption include consensus, leadership buy-in, cooperative elements, feasibility, target population, performance measures, and goals. Given the size of the IC, the paper will evaluate how long it will take to implement the given proposals and subsequently evaluate how long it will take to effectively penetrate the proposals to the unit level.

Section 6: ANALYSIS / EVALUATION

Evaluation Criterion 1: Effectiveness

Evaluating the certification proposal against existing processes suggests this would be an effective approach on multiple levels. By establishing a center of excellence facility to train MAT analysts under the authority of the ODNI would be another step in consolidating a fragmented analytic community that was so aptly described in the 9-11 Commission Report: "It is hard to "break down stovepipes" when there are so many stoves that are legally and politically entitled to have cast-iron pipes of their own."[41] The ODNI currently sponsors two training initiatives that can be used as a model for MAT analysts training. The ODNI's Analysis 101/201 courses are intended for relatively new analysts and focus on the fundamentals of analysis and analytical collaboration respectively. By building intelligence product evaluators who are trained and certified to evaluate on ICD 203 standards, MAT training would further promote a Joint Intelligence Community culture verses a culture of independent CIA, NSA, DIA, Air Force analysts. Cultural affiliation with independent intelligence agencies is not a bad thing as long as there is a touchstone to a larger, interconnected culture consolidated under the ODNI and its ICD 203 standards. This is inline with the 9-11 and WMD commission recommendations and meets the underlying intent of the IRTPA

when it established a Director of National Intelligence and the ODNI's responsibilities.

Having ODNI certified MAT analysts to evaluate and certify intelligence products prior to production would be an unprecedented approach at the scale that is being suggested. Current quality assurance efforts are fragmented and scatted across the entirety of the IC. As AFI 14-133 has demonstrated, ICD 203 interpretation evolves as the organizational process gets further away from the originating source. To certify MAT analysts as evaluators would consolidate the tribe and extend the ODNI's ICD 203 penetration into the disparate organizations and agencies of the IC. Given that many organizations already have standards and evaluation (StanEval) or quality control (QC) functions established, a certification process would take the same billets and efforts and align them across the IC. If an IC component wanted to exceed a given standard, there would be no resistance, but a foundational, tiered evaluation and analytical rating scale would be the baseline. Unifying the IC efforts under one recognized certification process would be healthy as it relates to establishing a feedback mechanism and evaluating and promoting analytical rigor, thus benefiting intelligence consumers and analysts alike. Having MAT evaluators certify intelligence products and share their findings would be revolutionary; for the first time giving decision makers an understanding of the quality of analytical rigor that informed the consumed intelligence products that they base their decision making processes on. This would effectively empower intelligence consumers to judge sufficiency for themselves.

Given the known analysis issues leading up the invasion of Iraq and the level of dependence of the nation's decision makers on the 2002 NIE, it is assessed that had the NIE been accompanied by a pre-production evaluation of analytical rigor and adherence utilizing today's tradecraft standards, then decision makers would have been informed on the insufficiency of process and thus demanded addition rigor. Instead, decision makers perceived rigor and falsely trusted the analysis, resulting an over two trillion dollar expense and almost 190,000 lives lost over the course of the

Iraq conflict.[42] This is not to suggest that a MAT Analysts certification alone would have prevented the war in Iraq. There were many issues identified, many of which were addressed in the 2004 IRTPA, but a MAT certification of the 2002 NIE would have been a valuable tool in communicating sufficiency of analytical rigor.

MAT evaluators would be vulnerable to error, thus requiring continued training. To carry authority, MAT analysts would need to come to this training seasoned by years of analytical experience. MAT evaluators would require currency training, and a mechanism to communicate and collaborate with senior evaluators. Evaluations would need to be reviewed for quality control and adherence to yet to be established or vetted processes.

The credentials of MAT evaluators would continually be tested. Mistakes could damage the MAT "brand" and in turn devalue the initiative. Trust in the MAT brand would require time, a consistent product, and diligent individuals all of which could be variable and undermined by missteps as the process is created.

Evaluation Criterion 2: Implementation

Implementation of a MAT analyst training and certification process will have challenges. For this analysis I assumed: 1) The course will be one month long, tripling the current Analysis 101 timeframe due to the expanded syllabus and certification requirements. 2) The class size will be twenty-five which is a typical classroom size for this type of instructor lead engagement and is also modeled after the approximate ODNI Analysis 101 class size.[43]

The barriers to implementation are training, manpower, and support requirements. For a schoolhouse to be established, facilities, instructor cadre, administrative overhead, syllabus development would all need to be established. To stand up a schoolhouse would require a significant amount of funding. Fortunately, much of this work has already been accomplished.

The ODNI's AIS already has a means for training evaluators and amplified guidance foe evaluators already exists in the form of the ODNI's *Rating Scale for Evaluation Analytic Tradecraft Standards*. Instructor cadre and infrastructure are already established at the Chantilly, VA training facility. The current efforts would need to be scaled at a cost that would require further evaluation beyond to scope of this paper. If the return on investment of the Analysis 101 course is deemed cost effective, a MAT certification would be a double down on this same investment. Most organization across the IC offer some form of analytical training, the Air Force offers such a class at Goodfellow Air Force Base. If the Air Force were to dissolve its service specific analysis training in trade for Joint, ODNI sponsored training then the cost of implementation would be negligible from the Air Force's perspective.

A 2008 RAND report on *Assessing the Tradecraft of Intelligence Analysis* recommended instituting IC-wide tradecraft training, and was quick to acknowledge both the need for and the difficulty of implementing such Community-wide training. As compared to the RAND recommendations, this proposal is surgical in its execution. One given benchmark of success is the ODNI Analysis 101 course, which has graduated over 7,000 students from over thirty different intelligence and law enforcement organizations since its conception in February of 2007.[44] A similar scale of effort would be appropriate for a MAT certification program, with the goal of providing MAT trained analysts embedded at various organizational levels.

Manpower being a valued commodity, it is not expected that additional billets funded on unit manning documents for MAT analysts. Therefore this capability and function would have to be absorbed by an already stressed of manpower. Most organizations have a section dedicated to StanEval or QC, but currently these functions are not aligned to the ODNI and ICD 203 analytic standards. For implementation to be successful, IC elements would have to shift current StanEval and QC functions to align with ODNI direction. In many ways this would require disparate

elements across the IC to defer some control to the ODNI, which would be politically challenging. For example, AFI 14-133 defines the Air Force's established analytic standards, which differ from established ODNI standards. For this proposal to be successful, Air Forces standards would have to defer to ODNI standards. The Air Force could implement higher standards if it chooses, but could not relax those standards without the consent of the ODNI.

Instead of forcing MAT certified analysts upon the entirety of the IC, one implementation approach would be to offer MAT certification as an enhancement to current unit level processes. IC organizations that elect to invest in and train MAT certified analysts would then be allowed to self-evaluate and certify their intelligence products with the branded MAT certification badges offered above. Those organizations electing to opt out would not be able to certify their products.

Evaluation Criterion 3: Adaptation

Given the exclusive and unique qualities of the MAT analyst's ability to evaluate and label intelligence with branded rating labels, it is possible that once intelligence consumers become aware of MAT certification, they would be a driving force in encouraging implementation, but this is a currently an unknown demand. It is foreseeable that reporting intelligence agencies would want this capability as a way to laud their own due diligence and adherence to ODNI established processes. It is also foreseeable that intelligence consumers, once educated on the MAT certification program, will push for the intelligence products that they consume to be pre-evaluated and MAT rated for rigor and standard adherence. Given that MAT certification is additive in nature, resistance from intelligence consumers is not likely, but since the burden of certifying products falls to the intelligence producers it is foreseeable that analysts and organizations would push back if they are unable to see the value. If MAT certification were to become coveted by senior analysts and organizational leaders, then buy-in from both analysts and decision makers

would be likely.

A phase-in approach would provide minimal risk on investment, with scale and IC penetration growing as MAT analysts obtain certification and initiate the evaluation of their organization's intelligence assessments. It is foreseeable that once products are accompanied by analytical rigor ratings, intelligence consumers will request the highest ratings possible of the products they are digesting. When MAT ratings fall below the intelligence consumer's sufficient requirements for analytic rigor this could facilitate further and potentially healthy dialogue between IC components and consumers concerning such topics as resources, capabilities, time requirements, collection, analysis and depth of expertise.

Adapting MAT certified analysts would not require day one, mass, IC-wide adaptation. A measured and steady implementation of the proposal would be a feasible. No changes to the current intelligence process would be required with MAT certification being an additive supplement to established baseline intelligence production. Minimal penetration could still present positive results. Success would beget success. If MAT analysts conducting per-publication evaluations proves to be a failure, then the investment lost would be measured and relative to the number of graduates. The first year of implementation could be considered a beta, proof of concept, thus further managing expectations as some of the trial and error implementation is worked out.

Where establishment of MAT analysts would robust existing processes, the cultural change and adaptation across 17 unique IC organizations and agencies would be difficult. ODNI directives would need to be written and enforced to ensue IC-wide adaptation. It has taken multiple congressional investigations and the passing of the 2004 IRTPA to get to the two and a half pages of analytic standards outlined in ICD 203, to see MAT certification fully adapted would require more that IC-wide buy-in, it would require mandated adherence.

Section 7: RECOMMENDATIONS

Modeling after the civilian sector's U.S. Green Building Council's (USGBC) Leadership in Energy and Environmental Design (LEED) program and borrowing from the medical and legal professions, it is recommended that the ODNI establish a certification board process to credential analysts as Masters of Analytic Tradecraft (MAT). MAT analysts would be certified to employ the ODNI's analytic rating scale, evaluate analytic products, and certify the rigor of those products prior to publication. To become MAT certified, analysts would need to attend a centralized training schoolhouse. This center of excellence would be sponsored by the ODNI, thus being joint in nature and linked across the IC. Having this level of consolidated analytical tradecraft training at the top of the IC, with a joint cadre of senior analysts teaching curriculum would be a top down approach currently lacking in the IC. Graduation would require the passing of a board style examination. Although ICD 203 has provided unifying direction, it is this author of this paper's opinion that resultant training opportunities continue to be disjointed, stove-piped, and fragmented across agency lines, resulting in poorly disseminated standards and divergent lines of effort. An IC, enterprise-wide analytical center of excellence is needed to raise the focus on analysis and analytical tradecraft. This schoolhouse would be the driving force behind standards, collaboration, continued learning, the sharing of best practices, quantifying and communicating analytical rigor, and certifying MAT analysts.

The curriculum of MAT certifying course would be focused on both the application and the evaluation of analytic tradecraft standards. This would be different from existing agency and service specific analysis training courses in that MAT analysts would graduate uniquely certified as Office of the Director of National Intelligence analytic tradecraft evaluators and thus able to evaluate assessments and rate associated analytical rigor. This would take what is currently a post report quality control spot check that is conducted by a small portion of ODNI staff and turn it into

an IC, enterprise-wide self-evaluation of analytical rigor that happens prior to an intelligence report ever being published.

By establishing a certification process, a MAT analyst would be trained and empowered (by virtue of their unique ODNI certification) to uphold established standards. Quantifying and evaluating the level of analytical rigor that informed an organization's assessment and publishing the resultant rating in the intelligence report will inform decision makers the amount and quality of analytical rigor that informed the analysis upon which they are trusting. It is then intelligence consumer's responsibility to determine if the rated level of rigor is sufficient for their needs. Due to the overt evaluation of intelligence products, this rating system would award analysts to strive for high levels of rigor.

It is recommended that the IC mimic the LEED model, certifying MAT analysts to evaluate their assessments for analytical rigor and standardization by applying their training and utilizing the ODNI's *Rating Scale for Evaluating Analytic Tradecraft Standards*. The resultant evaluation findings would accompany the assessment. This rating could only be given by certified MAT analysts and would be branded in a standardized way as to convey the amount of analytical rigor that went into the published intelligence report. Similar to how USGBC uses LEED certifications to convey a level of environmental performance and adherence to standards and established practices, so would MAT certification convey a level of analytical rigor to the intelligence consumer. In the case of analysis, MAT analysts would measure and certify rigor using the ODNI rating scale, and convey the findings utilizing a conformed branding scale. Departing from the current ODNI scale of poor, fair, good, and excellent, the badges displayed above (Figure 1) envision a level one through four criteria with level one equating to low rigor and building up to a level four which would equate to excellent rigor. Similar to how a licensed engineer might stamp their work with a seal containing their license number, so it is recommended that MAT analysts

certify their evaluations by including their assigned MAT number.

Currently ODNI encourages analysts across the IC to become familiar with the ODNI rating scale as a way to enhance analytic tradecraft. The MAT certification proposal goes much further, intensively training MAT analysts to be evaluators of ICD 203 analytic tradecraft standards, having intelligence reports assessed for analytical rigor before publication, communicating that rigor to intelligence consumers, and providing an immediate feedback loop to the analysts who are presenting their analysis. By embedding MAT analysts at the unit level and connecting them to the intelligence production process, the ICD 203 standards would be effectively pushed down and permeated across the IC.

An additional requirement to maintain MAT certification would be to complete and track continuing education (CE). Keeping with the LEED model, MAT analyst would be required to earn 30 CE hours every two years.[45] Qualifying CE opportunities would be defined and tracked by ODNI's Analytic Integrity and Standards group and thus ensure currency and proficiency of MAT analysts.

Additional benefits of establishing MAT certified analysts would be the duel hatted nature of these analysts as both evaluators of analytic products and as embedded subject matter experts expected to act as analysis tradecraft instructors and leaders. MAT analysts would provide advanced unit level instruction on ICD 203's nine analytic tradecraft standards. Beyond their individual instructor roles, a community of close-knit MAT analysts would be developed, thus facilitating effective cross talk and communication. ODNI would use MAT analysts to maintain dialogue, convey best practices, provide feedback avenues, disseminate time sensitive bulletins, build and maintain unit level libraries, capture and convey tactics, techniques, and procedures as they pertain to analysis, and provide analytical experts who conduct post-product after action reviews and assess where analysis went right and where it came up short. MAT analysis will be

unit and organizational level focal points, ensuring ICD 203 integration and coordination. MAT analysts could also fill an advisory role to intelligence production commanders and leaders, ensuring that the need for analytical rigor has a voice amongst the myriad of competing force: manning, resources, and production rates, to name a few. Additionally, MAT analysts could liaise between intelligence consumers and production analysts to ensure feedback is provided and absorbed.

In addition to the civil sector professions that require certification (doctors, lawyers, engineers, LEED associates, etc.), the Air Force's Weapons Instructor Courses (WIC) provides another model, which could be adapted by the ODNI and applied to MAT certification. The Air Force's WIC prides itself on its ability to develop an institutional pool of tactical and operational experts.[46] Embodying a creed of "humble, approachable and credible" the aggregate of WIC graduates form a fraternity of trusted experts and valued problem-solvers.[47] Upon completing an intensive, graduate-level curriculum, Air Force WIC graduates integrate at the unit level and provide a wide spectrum of academic and advisory support. They facilitate the collection of tactical level knowledge and use it to inform and author tactical doctrine. This collective of the Air Force's best weapon's officers forms a self-aware, continually improving, and always communicating trust of knowledge that both informs and enables best practices across the multi-domain tactical environments in which the Air Force fights.[48]

In this same vein, but transcending any one service or agency, MAT analysts would be ODNI trained and credentialed, providing unit and organizational level experts in analytical tradecraft and informing and upholding ICD 203's standards of analysis. Empowered as evaluators of analytical rigor, MAT analysts would rate assessments utilizing the afore-mentioned branded rating system, to ensure and convey rigor while concurrently fulfilling the roles of trainer and trusted advisor.

Chuck Howe

DISCUSSION PAPER NUMBER 17

USING INDUSTRY ANALYSIS FOR STRATEGIC INTELLIGENCE

Capabilities and Strategic Intent

by Chuck Howe

National Intelligence University
Washington, DC

January 2015

Using Industry Analysis for Strategic Intelligence: Capabilities and Strategic Intent

In Chuck Howe's *Using Industry Analysis for Strategic Intelligence: Capabilities and Strategic Intent*, the author argues that the Intelligence Community should evaluate globalization as a strategic factor affecting interdependencies between nations. He outlines a variety of industry analysis techniques—including the Five Forces Model, the External Environment Model, and the Value Chain Model—that could be valuable to analysts. Using the semiconductor industry as a case study, Howe illustrates methods that analysts should use in deriving strategic insights from industrial capability.

Using Industry Analysis for Strategic Intelligence is part of the National Intelligence (NI) Press Occasional Paper Series. Occasional Papers examine topics of unique value to the Intelligence Community.

The goal of the NI Press is to publish high-quality, valuable, and timely books on topics of concern to the Intelligence Community and the U.S. government. Books published by the NI Press undergo peer review by senior officials in the U.S. government and by outside experts.

This publication has been cleared for unrestricted distribution. The views expressed in this publication are those of the author and do not necessarily reflect the official policy or position of the Department of Defense, the Intelligence Community, or the U.S. government. Authors of NI Press publications enjoy full academic freedom, provided that they do not disclose classified information, jeopardize operations security, or misrepresent official U.S. policy. Such academic freedom empowers authors to offer new and sometimes controversial perspectives in the interest of furthering debate on key issues. This publication is subject to Title 17, U.S. Code, Sections 101 and 105. It is in the public domain and may not be copyrighted.

ACKNOWLEDGMENTS

First and foremost, I thank Jeff Stillman, in the Office of Analytic Integrity and Standards, for leaving my fellowship research proposal on the "stack" for consideration by the ODNI Exceptional Analyst Fellowship selection committee. Even though I am not an intelligence analyst, he recognized the value of a different perspective, and throughout encouraged my project.

Also critical to the existence of this project was the support of my leadership in AT&F, especially Wally Coggins, to gap my position for the year and allow me the time to research, write, and produce this introduction to industry analysis for the analytic community.

Many thanks to current and former faculty members at the Industrial College of the Armed Forces (now Dwight D. Eisenhower School for National Security and Resource Strategy). There are several war colleges in the Department of Defense, but only one Industrial College. Drs. Linda Brandt and Rich Shipe reviewed my research proposal and spent even more of their time to provide an outside review of the manuscript. When I was a student at ICAF many years ago, Dr. Gerald Abbott introduced me to the primary sources on industry structure economics and analysis; I appreciate his continuing mentorship in this subject area. Last, but not least, CAPT Susan Maybaumwisniewski, USN (ret.), a former colleague at ICAF, now at BENS, provided early brainstorming and outline direction to this project—a wonderful person to kick an idea around with.

I would be remiss if I did not mention the semiconductor industry that I have followed for the last six years. There are no better representatives than the outstanding people at SEMI and EDAC. They are exemplars of an industry that is always willing to educate others on the challenges they face at the leading edge of this global industry.

I started my understanding of the analytic community by taking Analysis 101 and Open Source Academy courses. It was great meeting the "up-and-coming" crop of intelligence analysts, and they showed me they had the wherewithal to try new analytic methods. Outside of the classroom, the development of the industry analysis methodology was aided immeasurably by the meetings with analysts across the Intelligence Community. At each of meetings I would repeat

the mantra "industry analysis models are a tool, not a solution," to assure the analyst I was looking to complement their analytical skill set. Intelligence analysts remain the target audience for this book, and it is hoped that they will add it to their toolkit.

In my travels across the analytic community, I came upon a small but very productive team at the Institute for Analysis. They listened to and critiqued several iterations of my project, and their director, Donn Treese, even provided an outside review of the manuscript.

Dr. Cathryn Thurston, the acting vice president of OOR, provided unflagging support to this book, even when that support had to compete with construction projects, the relocation of the office, staff departures to early retirements, and the never-ending lineup of master's thesis aspirants at NDIC (now NIU). Her editorial direction on draft submissions kept my initial intent intact, while greatly improving its delivery.

Finally, I want to recognize my wife, Cindy, an extraordinary teacher, for her unfailing support throughout this endeavor. Thank you, Cindy.

ABOUT THE AUTHOR 123

Chapter One

Introduction

The U.S. Intelligence Community needs to augment its primary focus on political and military dimensions to address the potential for strategic surprise due to the changing nature of business, industry, and national competitiveness in a global economy. The Council on Competitiveness, a nonpartisan, nongovernmental organization of American chief executive officers, university presidents, and labor leaders, highlights the complex nature of these changes (see box).[1]

Lens of Competitiveness

A rising standard of living for all Americans is not guaranteed. The United States now operates in a truly global economy:

- Companies are outsourcing and spreading their value chains globally
- Hundreds of nations are trading tens of trillions of dollars daily in the financial markets
- Strong markets and talent pools have emerged in the developing world
- Businesses and governments operate across highly integrated regional economies
- Vast communications networks allow for immediate global connectivity and information transfer and also create unprecedented vulnerabilities
- New risks, such as competition for natural resources, climate change and terrorism, now affect the competitiveness of countries, companies, and communities

Whether our citizens and businesses will thrive in the new global economy depends largely on our ability to understand and act upon these prevailing forces of change and attract high-value economic activity to regions across America.

Source: Council on Competitiveness, *www.compete.org*.

The opening observations from the Council on Competitiveness highlight the major strategic shifts in a *global* economy and their importance to our country. The developing economies of the world are driving these shifts, and their industrial capability is a major component of their success. Analyzing an industry in another country or region of the world can yield strategic insights about a nation's capabilities and strategic intent.

While the U.S. Intelligence Community is aware of the discussion, as evidenced in the 2009 *National Intelligence Strategy*, it still needs to pay closer attention to the strategic implications of these changes. In particular, intelligence analysts must be able to gauge the global competitiveness of other nations in order to ensure that this dimension is a consideration in strategic assessments.

A key indicator of competitiveness is industrial capability. A nation's industrial capability is an economic engine, producing jobs, growth, and ultimately prosperity. Developed and developing nations realize this and want to build an industrial engine to reap the benefits. Relatively recent advances in information technology that produce unprecedented amounts of open-source information help these nations.[2] Business strategists and competitive intelligence professionals use many analysis tools to mine the plethora of open sources—to understand the plans and intentions of other firms and the global market—so that they can achieve a competitive advantage.

Although the Intelligence Community is not collecting information on individual businesses, it is interested in national- or regional-level plans and aspirations. To shed light on sometimes-opaque economic plans and strategic intentions, the all-source intelligence analyst can use open-source data, industry analysis tools, and a nation's interest in growing its economy.

In short, a nation's policy and investment decisions to grow and sustain its industrial capability are visible through their interactions with industry. The thesis of this book is that an all-source intelligence analyst can employ the analysis tools of business strategists and competitive intelligence professionals to develop strategic intelligence insights regarding a nation's plans and intentions.

Organization of Discussion

To support the thesis and intelligence focus of this book, the remaining chapters of this book are all oriented toward the all-source analyst. The book consists of four chapters. This first chapter provides general background information, to help orient the reader. Chapter 2 introduces industry analysis and proposes a methodology for application in the Intelligence Community. Chapter 3 describes the five steps an all-source analyst would go through to provide inputs for an intelligence assessment. Chapter 4 presents concluding discussions on the value of industry analysis to the U.S. Intelligence Community. There are also three appendixes. Appendix A provides a template for one of the industry analysis models presented in Chapter 2. Appendixes B and C, respectively, provide a semiconductor tutorial, as well as information related to the semiconductor industry—of use in understanding the discussion in the main chapters.

Background

Before starting our discussion of industry analysis and its application, there are two personal observations operating in the background.[3] The first is that globalization and its potential for strategic impact on national competitiveness has not yet grabbed the full attention of the Intelligence Community. The second observation concerns the Intelligence Community's grasp of other nations' industrial capabilities; outside of leading-edge science and technology, defense issues, dual-use technologies, and nonproliferation, the Intelligence Community is largely silent. The following two subsections briefly provide the background for these observations.

Globalization and National Competitiveness

The term *globalization* has many definitions. Suzanne Berger, in her book *How We Compete: What Companies around the World Are Doing to Make It in Today's Global Economy*, describes globalization as "the acceleration of the processes in the international economy and in domestic economies that operate toward unifying world markets."[4] These changes and the domestic concerns they cause are not unprecedented. There was an earlier period bracketing the

turn of the nineteenth century that also saw the same levels of capital mobility, trade, and immigration among countries. This early period of globalization was broken by World War I, and it was not until the 1980s that the world economy returned to the same high levels of capital mobility, foreign direct investment, and trade. An important point regarding the end of this earlier period of globalization is that nations were largely able to shut off their ties to the outside world (from the 1920s through the 1980s) and continue economic growth.

Role of the Intelligence Community: 1950s to 1980s

A look at the history of the Intelligence Community, specifically foreign economic intelligence during the Cold War, reveals that one of the stated purposes, "To assist in divining the intentions of potential enemies in the conviction that how they act in the economic sphere is likely to reveal intentions," generated a lot of support for industry-sector analysis.[5]

This initial interest in industry-sector analysis in the early years of the Cold War was also due to a sense among policymakers that the Soviet Union could possibly outperform the United States economically and militarily.[6] To address this concern, the Central Intelligence Agency devoted considerable analytical resources to industry studies. These studies of selected sectors are characterized as assessing

> the strengths, weaknesses, and prospects of these sectors in detail and on a continuing basis. These studies generally had a special focus on the technological level of the given industry. They supported not only intelligence objectives but, as contributions to publications of the Joint Economic Committee of Congress, contributed to the general pool of knowledge on the Soviet economy.[7]

These analyses focused on vulnerabilities in the Soviet economy and, especially, areas where progress could hamper their economic development. As the Cold War progressed, increasing emphasis on international and military topics resulted in the transfer of analyst resources away from Soviet economic performance and specific industry-sector analysis of the Soviet Union.[8]

While it is clear that globalization and the practice of industry analysis by the Intelligence Community are not unprecedented, what has been the role of the Intelligence Community in more recent experience? Michael L. Dertouzos, Richard K. Lester, and Robert M. Solow, a group of MIT researchers, made this prediction in their 1989 book, *Made in America*:

> To live well, a nation must produce well. In recent years many observers have charged that American industry is not producing as well as it ought to produce, or as well as it used to produce, or as well as the industries of some other nations have learned to produce. If the charges are true and if the trend cannot be reversed, then sooner or later, the American standard of living must pay the penalty.[9]

Mark Lowenthal describes the corresponding debate in the Intelligence Community at that time:

> During the late 1980s some people maintained that several of these issues (overseas competitiveness, trading relations, foreign economic espionage, **industrial espionage** undertaken by businesses, and possible countermeasures) could be addressed, in part, through a closer connection between intelligence and U.S. businesses [emphasis in original]. Few advocates of closer intelligence–business collaboration, however, had substantial answers for some of the more compelling questions that it raised (which is one reason that this approach was quickly rejected).[10]

This description is the most up-to-date open-source assessment of the Intelligence Community's consideration of industry analysis. In 2006, Suzanne Berger, who was a major contributor to the work of Dertouzos et al., the MIT group that provided important observations and prescriptions in *Made in America*, released the book *How We Compete*. In it, Berger observed that all of the industry prescriptions they had made in 1989 had become the basic operating code of American companies. But Berger also said, "[A]mong our greatest concerns today is one that was not on the list in the 1980s—how to make good companies and good jobs stick in the United States."[11] She further observed:

> Then, our challenge seemed to be import penetration. Today, the fragmentation of the system of production has changed the problem. Now it's the prospect that the resources available to companies abroad—and well-educated and lower cost workers are one of the main attractions—will induce businesses to shift their activities abroad.

Globalization is upon us, and, unlike the early twentieth century, nations cannot "turn it off" and build or sustain industrial capability.

Moving the Intelligence Community Out of Its Comfort Zone

The Intelligence Community's internal discussions in the 1980s about sharing intelligence with business to foster our national competitiveness should not be confused with what is being advocated here—the development of strategic intelligence insights from understanding the development of industrial capability *in other nations* and the consideration of these strategic insights in producing intelligence products for our national policymakers. Although globalization is all around us, the *National Intelligence Strategy* fails to push the Intelligence Community out of the traditional political-military sphere.[12] As Fareed Zakaria observes of America's traditional perspective, "At the political-military level, we remain in a single-superpower world. But in every other dimension—industrial, financial, educational, social, cultural—the distribution of power is shifting, moving away from American dominance."[13]

To be fair, the Intelligence Community is not ignoring globalization; it is just not actively pursuing it. But a closer look at the first of its four strategic goals in the 2009 *National Intelligence Strategy*, "Enable wise national security policies," could provide an avenue for collection and analysis of trends in globalization.[14] In support of that goal, the Intelligence Community further explains it "will provide policymakers with strategic intelligence that helps them understand countries, regions, issues, and the potential outcomes of their decisions. We will also provide feedback to policymakers on the impact of their decisions."[15] So, if the Intelligence Community is aware of globalization and one of its strategic goals could support analysis of global trends, what is the argument for operating outside its spheres of comfort by taking a closer look at other nations' industrial capability?

Competing Analysis: Short-Term Crises and Long-Term Problems

We cannot ignore that the Intelligence Community is heavily engaged in our nation's current overseas military commitments. Plus, the Intelligence Community is also charged with addressing transnational issues, such as criminal organizations, failed states, ungoverned spaces, the global economic crisis, climate change, energy competition, rapid technological change, and dissemination of information.[16] But the main question of this book is: who in the Intelligence Community is monitoring the industrial capabilities of other nations and regions, which may have a major impact on American interests and security?
